VOLUME XVIII

M—MEXICO

M the thirteenth letter of the English and most of the other west European languages, is one of the four liquids, or semivowels; it is also classed as a labio-nasal, its sound being produced when, with lips closed and the whole uvula lowered, the breath makes a humming noise as it issues through the nostrils. The lips play the same part in the pronunciation of *m* as in that of *b*, but in pronouncing *b* the nasal passage has no part. Hence when that passage is obstructed or closed the sound produced is that of *b*, not of *m*.

The *M* as a capital letter has the same form in the Greek and the Latin alphabets and in all the alphabets derived from them, and in all those alphabets generally the same sound value.

In English there are a few words of Greek origin, mostly technical, in which *mn* begins a syllable or a word: in such cases the *m* is silent, for example, mnemonic, nemonic.

In many words derived from other languages the *m* of the original word is changed to *n* in English, for example: *comitatus* (Lat.), county; or contrariwise *n* is changed to *m:* Anglo-Saxon *henep* becomes hemp. Often *p* is added after *m* to give that letter greater distinctness, for example, *eximere* (Lat.), take out, *exemptus,* exempt.

MAARTENS, mär'tĕns, **Maarten** (pseudonym of the Dutch author, Joost Marius Willem van der Poorten-Schwartz): b. Amsterdam, Aug. 15, 1858; d. Zeist, Aug. 4, 1915. He passed his early life in England, was educated in Germany and at the University of Utrecht, was admitted a barrister but chose literature as a profession, and in 1889 published his first important work, *The Sin of Joost Avelingh,* which at once arrested the attention alike of critics and of the reading public. This, like all his volumes, was written at first hand in English, not, as has been sometimes supposed, translated from a Dutch manuscript. Maartens thus presented the curious instance of an author electing to address wholly a foreign public. Indeed it was only with reluctance that he published his books in Dutch, and the public in the Netherlands was generally hostile to them. His novels are chiefly characterized by spiritual conflict and the workings of conscience. The best known is probably *God's Fool* (1895); others include *An Old Maid's Love* (1891); *A Question of Taste* (1891); *The Greater Glory* (1894); *My Lady Nobody* (1895); *The Price of Lis Doris* (1909) and *Eve* (1912); besides short stories and plays.

MAASIN, mä-ä'sĭn, municipality, Philippines, on the southwestern coast of Leyte Island, 78 miles south of Tacloban. It is a well-built port and has an active coastwise trade. The chief export is hemp. Pop. (1939) 29,264.

MAASS, Otto, Canadian chemist: b. New York, N. Y., July 8, 1890. After a course at the Montreal High School, he studied at McGill, Berlin, and Harvard universities. In 1917 he became professor in charge of physical chemistry at McGill and in 1923 was named Macdonald professor of physical chemistry there. He became chairman of the department of chemistry at McGill in 1937. He became general director of the Canadian Pulp and Paper Research Institute in 1940. In 1940–1941 he was president of Section III of the Royal Society of Canada. He published *Introduction to Physical Chemistry* in 1931 (rev. ed. 1939), and papers dealing with pulp and paper, and physical chemistry.

MAASTRICHT, mäs-trĭkt' (or Maestricht), commune, Netherlands, capital of Limburg Province, 2.5 miles from the Belgian border; a rail and water transportation center on the Maas (Meuse) River. In Roman times a town grew up here at the crossing (Lat. *trajectus*) of the Maas, whence the name Maastricht. The town was the seat of a bishopric, 382–721, and was well fortified by the 13th century. Its walls, much strengthened thereafter, were torn down during the 1870's. For joining the cause of the prince of Orange, William I, the town was sacked by the Spaniards under Alessandro Farnese in 1579; recovered by the Dutch under Prince Frederick Henry in 1632, and retained by them at the Peace of Westphalia (1648), although later captured by the French in 1673, 1748 and 1794. It was captured by the Germans in 1940 and retaken by the Americans, Sept. 15, 1944. The most notable structures are the Romanesque Church of St. Servatius (St. Servaas), founded in the 6th century (oldest part now standing built about 900 A.D.), the oldest church in the Netherlands; the Church of Our Lady (11th-century Romanesque; rebuilt 1764); the town hall built by Pieter Post (completed 1683; now a museum); and a 13th-century bridge (rebuilt 1683) over the Maas to Wijk, a suburb. Nearby are the great labyrinths of the sandstone quarries of Pietersberg, which have been worked since Roman times. Important manufactures include textiles, paper, ceramics, glass, cement and chemicals. Pop. (1948 est.) 75,276.

MAB, the fairy queen of Connaught and a familiar name in Celtic folklore. Mab has been celebrated by Shakespeare and other English poets. The name is of uncertain origin, being variously derived from the Midgard of the Eddas, the Habundia or Dame Abonde of Norman fairy lore, and from the Cymric *mab,* a child. According to Voss, Mab was not the fairy queen, the same as Titania, this dignity having been ascribed to her only by mistaking the use of the old English word *queen,* which originally meant only a woman. Queen Mab is mentioned in Shakespeare's *Romeo and Juliet,* Ben Jonson's *Satyr,* Thomas Randolph's pastoral *Amyntas,* Thomas Drayton's *Nymphidia* and Milton's *L'Allegro.*

MABERY, mā'bĕr-ĭ, **Charles Frederic,** American chemist: b. North Gorham, Me., Jan. 13, 1850; d. Portland, Me., June 26, 1927. He was graduated at the Lawrence Scientific School in 1876, and was assistant instructor in chemistry there from 1875 to 1883, when he became professor of chemistry in the Case School of Applied Science, serving until 1911; emeritus professor thereafter. In the investigation of the composition of American petroleum his work brought him into special prominence. He also did valuable work in connection with electric smelting. The results of his original investigations after 1876 were published in the *Proceedings* of the American Academy of Arts and Sciences and in various chemical journals at home and abroad.

MABIE, Hamilton Wright, American editor, critic and essayist: b. Cold Spring, N. Y., Dec. 13, 1845; d. Summit, N. J., Dec. 31, 1916. He was graduated at Williams College in 1867 and from the Columbia University Law School in 1869. He joined the staff of the *Christian Union* (after 1893, the *Outlook*) in 1879 and in 1884 became associate editor with Lyman Abbott, a position which he occupied until his death. Through his journalistic work, as well as his lectures and papers, he constantly advocated an improvement in the standards of education and in social conditions, and did much to forward American literary taste. His books for children were especially notable in the latter category. Among his works are *Norse Stories Retold from the Eddas* (1882); *My Study Fire,* 1st series (1890), 2nd series (1894); *Short Studies in Literature* (1891); *Essays in Literary Interpretation* (1892); *Nature and Culture* (1897); *Books and Culture* (1897); *Work and Culture* (1898); *William Shakespeare: Poet, Dramatist and Man* (1900); *American Ideals, Character and Life* (1913); *Japan To-day and To-morrow* (1914); and a children's series, *Myths* (1905), *Fairy Tales* (1905), *Heroes* (1906), *Legends* (1906), and *Heroines* (1908) *that Every Child Should Know.*

MABILLON, mà-bē-yôn', **Jean,** French ecclesiastic and author: b. Saint-Pierre-du-Mont, Champagne, Nov. 23, 1632; d. Paris, Dec. 27, 1707. Having joined the Benedictines of Saint Maur (Maurists) at Reims in 1653, he was sent, in 1664, to the literary center of his order, St.-Germain-des-Prés, at Paris. There he was chosen to assist Dom Jean Luc d'Achery in the compilation of his *Spicilegium Veterum Scriptorum* and subsequently edited the works of Saint Bernard (1690) in the series of the fathers published by his congregation. In 1683 he was sent to Germany by Louis XIV to collect documents relating to French history; and the applause with which his *Iter Germanicum,* a narrative of the journey, was received, induced the king to send him to Italy in 1685 to make purchases for the royal library. A result of this tour was his *Musaeum Italicum* (1687–1689), a work of great value. Later he was selected by his superiors to refute Jean de Rancé, abbot of La Trappe, who had condemned the custom of permitting monks to study. His *Essay on Monastic Studies* (*Traité des études monastiques*) which appeared in consequence in 1691, and *Réflexions sur la réponse de M. l'abbé de la Trappe* (1692), were equally remarkable for sound argument and good temper. His most important other works are *Vetera Analecta* (1675–1685); *De Re Diplomatica* (1681; supplementary vol., 1704), a milestone in historiography, since it laid down scientific principles for determining the authenticity of medieval documents; and *De Liturgia Gallicana* (1685). He edited and published with Thierry Ruinart *Acta Sanctorum Ordinis Sancti Benedicti* (1668–1702) and prepared the first four volumes of the *Annales Ordinis Sancti Benedicti* (1703–1739). A collection of his works, *Ouvrages posthumes,* appeared in 1724, and his *Inedited Correspondence with Montfaucon, Magliabecchi, etc.,* was edited by Valéry (1847).

Consult Baackner, A., *Mabillons Reise durch Bayern im Jahre 1683* (Munich 1910); Denis, P., *Dom Mabillon en sa méthode historique* (Paris 1910).

MABINI, mä-bē'nē, **Apolinario,** Filipino insurgent: d. Philippine Islands, 1903. He was educated in the Catholic College of Manila, entered the public service under Spanish rule, became advocate of the treasury, resigned in 1896, and entered the insurrection. He was imprisoned for nine months by the Spaniards and then associated himself with Emilio Aguinaldo and José Rizal. Although a sufferer from paralysis, he was the soul of the revolutionary movement and by many is considered the ablest man produced in the revolution. He became privy councillor of Aguinaldo and for a time was minister of foreign affairs and chief of the Supreme Court in the latter's government. In 1899 he surrendered to the United States, was sent into exile, but allowed to return in 1903 when he took the oath of allegiance. He was the brains of the Aguinaldo government formed at Malolos, but opposed the Malolos constitution because he believed that the Philippines needed a strong, centralized government and also because it did not provide for a separation of church and state. He was a Tagalog.

Consult Worcester, Dean C., *The Philippines, Past and Present,* 2 vols. (New York 1914).

MABINOGION, măb-ĭ-nō'gĭ-ŏn, **The,** the name generally but incorrectly applied to all medieval Welsh stories. Of the general title *Mabinogian,* which Lady Charlotte Guest's English version (1838–1849) has made familiar, John Rhys gives an explanation. "An idea prevails," says Principal Rhys, "that any Welsh tale of respectable antiquity may be called a mabinogi; but there is no warrant for extending the use of the term . . . For, strictly speaking, the word mabinog is a technical term belonging to the bardic system, and it means a literary apprentice. In other words, a mabinog was a young man who had not yet acquired the art of

making verse, but who received instruction from a qualified bard. The inference is that the 'Mabinogion' meant the collection of things which formed the mabinog's literary training — his stock in trade, so to speak; for he was probably allowed to relate the tales forming the 'four branches of the Mabinogion' at a fixed price established by law or custom. If he aspired to a place in the hierarchy of letters, he must acquire the poetic art." In Lady Charlotte Guest's later edition in one volume (1877),— the most convenient edition for reference,— 12 tales in all will be found. Of these, the most natively and characteristically Welsh in character are such tales as the vivid, thrice romantic 'Dream of Rhonabwy,' which owes little to outside sources. 'The Lady of the Fountain,' on the other hand, shows in a very striking way the influence of the French chivalric romances that Sir Thomas Malory drew upon so freely in l is 'Morte d'Arthur.' In the admirably edited Oxford text of the Welsh originals by Rhys and Evans (1887–90), 'The Lady of the Fountain' appears under the title of 'Owain and Lunet'; and Lunet's name at once recalls Tennyson's 'Idylls of the King.' The old manuscript volume of the 'Mabinogion,' known as the 'Llyfr Coch o Hergest,'— the 'Red Book of Hergest,'— written in the dialect of South Wales, is in the famous library of Jesus College, Oxford, the one college in the older English universities which has a time-honored connection with Welsh scholarship and Welsh literature. The tales, though in their present form not older than the 12th century, embody traditions that were afloat prior to that date. Consult John, I. B., 'The Mabinogion' (London 1901); and Lloyd, E. J., 'The Mabinogion as Literature' (in the *Celtic Review,* Edinburgh 1911).

MABLY, Gabriel Bonnot de, gä-brē-ĕl bŏn-ō dē mä-blē, French ecclesiastic and publicist: b. Grenoble, 14 March 1709; d. Paris, 23 April 1785. His family name was Bonnot. Like his younger brother, the philosopher Condillac (q.v.), he was destined for the Church, and after studying at the seminary of Saint Sulpice in Paris was ordained subdeacon. He showed little liking for theology, and for some time was secretly employed in affairs of state by his relative Cardinal de Tencin, minister of Louis XV, conducting the most difficult negotiations and writing elaborate reports with an ability for which the minister received all the credit. Later he applied himself to literature, and in 1748 published his 'Droit publique de l'Europe,' which achieved a remarkable success. It was followed by 'Observations sur les Grecs' (1749); 'Observations sur les Romains' (1751); 'Entretiens de Phocion' (1753); 'Observations sur l'histoire de France' (1755); 'Principes des négociations' (1757); 'De la manière d'écrire l'histoire' (1773); 'De la législation' (1776); 'De l'Idée de l'histoire' (1778); and 'Principes de morale' (1784). Having been requested by the government of Poland to prepare for them a code of laws, he visited that country in 1771, and published in 1781 a work 'Du Gouvernement de la Pologne.' He was also consulted by the American Congress in 1783 on the preparation of the Constitution, and embodied his views in his 'Observations sur le gouvernement et les Lois des Etats-Unis d'Amérique' (1784). In this work he foretold the speedy downfall of the United States. He was an idealiser of ancient Rome and was enamored of the socialistic state and the communism of wealth, and from his pessimistic views on modern social organization was known as the "prophet of woe." Consult Guervier, 'L'Abbé Mably, moraliste et politique' (1886); de la Serae, 'Mabylet les physiocrates' (1911).

MABUCHI, mä-boo'chē, Japanese writer and religious teacher: b. 1693; d. 1769. He was distinguished as a scholar, and utilized his great learning in the endeavor to purify the native religion, Shinto, from the accretions of Chinese and Buddhist philosophy, etc., whereby he regarded it as having been corrupted. His love and knowledge of antiquity enabled him to present the native faith in its original simplicity, and his teachings were exemplified in his own life. To him modern students are largely indebted for direct access to ancient Japanese poetry. He added greatly to the knowledge of the past. He was the first of the three great scholars (Motoöri and Hirata being the others) who dedicated themselves to this work of simplifying the ancient faith of the country.

MABUSE, mą'bûz', **Jan,** Flemish painter: b. Mauberge, Hainault, in 1472; d. Antwerp, 1 Oct. 1552. His real name was Jean Gossart (or Gossaert). When he became a member of the Guild of Saint Luke at Antwerp in 1503, he signed the register as Jennyn van Henegouwe (John of Hainault). He signed his early pictures Jennyn Gossart and those of his middle and last period Joannes Malbodius (John of Mauberge). In the register of the Guild of Our Lady at Middleburg he is entered as Jan de Waele (John the Walloon). It is not known from whom he learned his art, but at Antwerp he fell under the influence of Quentin Matoys (15th century). In 1508 Mabuse, as he is familiarly known, went to Rome with his patron, the magnificent Philip of Burgundy, visiting Verona and Florence on the way. He stayed in Rome a year and returned to the court of Burgundy in November 1509. He then was employed at the Duke of Burgundy's castle of Zuytburg, painting for Philip. After Philip's death in 1524, he entered the service of Adolphus of Burgundy. When Christian II of Denmark visited the Low Countries he asked Mabuse to paint his dwarfs and in 1528 he requested the artist to design the tomb for his queen, Isabella, in the abbey of Saint Pierre, near Ghent. Mabuse also painted the children of Christian II — John, Dorothy and Christine, which came into the collection of Henry VIII of England. Mabuse also designed and erected the tomb of Philip of Burgundy in the church of Wyck. Van Mander's biography accuses him of habitual drunkenness, but the great works produced by him, as well as their number, prove that he was a hard-working and painstaking artist, perfectly in command of his powers. In 1527 he accompanied Lucas of Leyden on a pleasure trip to Ghent, Mechlin and Antwerp. Mabuse seems to have been the first of the Netherland painters to go to Italy. He brought back a new style; and from his time to that of Rubens and Van Dyck it was considered the proper thing for all Flemish painters to go to Italy.

The best specimen of his early and purely Netherland is the famous 'Adoration of the Magi,' long at Castle Howard, England, and purchased by the National Gallery, London, in 1911 for the extraordinary sum of $192,000. This great picture was painted in 1500 for the abbey of Grammont in eastern Flanders and was sold by the monks in 1605 to the Archduke Ferdinand, who placed it in a private chapel in Brussels. In the 18th century Charles of Lorraine acquired it and at his death in 1775 the picture passed to England. The signature of Jan Gossart appears in golden letters on the band of the crown on the negro king. In this great work there are 30 figures with an architectural background, much in the style of Memling and Roger van der Weyden.

The National Gallery (London) contains five other precious works by Mabuse, including the portrait of Jacqueline of Burgundy; portrait of a man holding his gloves: and the portrait of a man with a rosary. Hampton Court has the 'Three Children of Christian II, King of Denmark'; 'Adam and Eve in Paradise'; a portrait of 'Holbein'; 'Eleanor of Austria'; and a 'Holy Family.' The Louvre has a magnificent portrait of Jean Carondelet, chancellor of Flanders; a 'Virgin and Child'; a portrait of 'Bénédictin'; and 'a man and his wife.' 'Saint Luke painting the Blessed Virgin and Child' formerly in the cathedral of Mechlin but now in that of Prague, painted in 1515, is a fine example of Italianized Netherland art. Another celebrated picture was a large triptych, 'The Descent of the Cross,' painted for Maximilian of Burgundy for the monastery of Our Lady and Saint Nicholas at Middleburg, which perished when that building was burned in 1568. Dürer saw it in 1520 and admired it extremely, although he said "the composition was not as good as the execution." Mabuse excelled in portraiture. Occasionally Mabuse turned to mythological subjects, such as 'Neptune and Amphitrite' (1516) in the Berlin Museum. His architecture is beautifully drawn and his painting of rich materials — damasks, embroideries and tapestries — is superb. Consult Segard, Achille, 'Mabuse, Jan' (in *Les Arts,* No. 123, p. 1, with illustrations including 'Adoration of the Magi,' Paris 1912); Weisz, Ernst, 'Jan Gossart' (Freis 1913).

MAC, or **MC,** a Gaelic prefix, as MacGregor, MacDonald, McKinley, etc. It corresponds with von in surnames of Teutonic origin, Fitz in those of Romance origin, or Ap or Ab in Welsh surnames.

MACA, a tribe of people living in the forests of the eastern slope of the Andes in central Ecuador. They live in huts of palm leaves, make pottery, hunt and cultivate yucca, corn and tobacco. The various tribes, not yet classified as to language, frequently war with one another. Their weapons are spears, blowguns and poisoned arrows. They dry the heads of slain enemies.

MACABEBE, mä-kä bā'bā, Philippines, a pueblo of the province of Pampanga, Luzon, situated at the head of the Pampanga River delta, nine miles from Manila Bay and seven miles southeast of Bacolor. Pop. 16,000.

MACABER (mą-kä'bėr) **DANCE.** See DANCE OF DEATH.

MACADAM, măk-ăd'ąm, **John Loudon,** Scottish engineer: b. Ayr, 21 Sept. 1756; d. Moffat, Dumfriesshire, 26 Nov. 1836. In 1770 he was sent to an uncle at New York, where he remained during the War of Independence, and realized a considerable fortune as agent for the sale of prizes. At the close of the war he returned to Scotland, and in 1798 was appointed agent for revictualing the navy in the western ports of Great Britain, and took up his residence at Falmouth. He afterward resided for many years at Bristol. It was here, in 1815, on being appointed surveyor-general of the Bristol roads, that he resumed experiments he had made in Scotland, and first had full scope for putting in practice the important improvements in road-making which had long before occupied his thoughts. By 1823 his general success was admitted; and in 1827 he was made general surveyor of roads. In carrying out his improvement he had expended several thousand pounds from his private resources; and the House of Commons, having been satisfied of the fact by the investigation of a committee, both reimbursed the actual outlay and presented him with an honorary tribute of £2,000, presenting to him a total of £10,000. His invention was rapidly introduced throughout the civilized world, and his own name was made synonymous with it.

MACADAM, a modern system of road-making invented by J. L. Macadam (q.v.), which consists in forming the roads out of hard materials such as granite, or basalt broken into pieces, none of which are too large to pass through an iron ring 2½ inches in diameter, and then deposited evenly in a bed of from 6 to 12 inches in thickness. The bed thus laid becomes perfectly compact and smooth, and in proportion as it is worn away or cut into ruts by traffic can easily be restored by a new coating of materials. See ROADS AND ROAD-MAKING.

McADOO, măk'ą-doo', **William Gibbs,** American jurist: b. near Knoxville, Tenn., 4 April 1820; d. 1894. He was graduated in 1845 from the East Tennessee University at Knoxville, sat in the Tennessee legislature 1845–46 and served in the Mexican War in 1847. He was afterward admitted to the bar and was attorney-general of the Knoxville judicial district, 1851–60. He removed to Georgia in 1862, served in the Confederate army during the Civil War and in 1871 became judge of the 20th judicial district of Georgia. He published a volume of poems and, with H. C. White, 'Elementary Geology of Tennessee.'

McADOO, William Gibbs, American cabinet officer: b. near Marietta, Ga., 31 Oct. 1863; d. Washington, D. C., 1 Feb. 1941. Descended from a distinguished Southern family, his father, Judge William Gibbs McAdoo, a jurist and a soldier of the Mexican and Civil wars, became attorney-general of Tennessee some years after losing his wealth in the general devastation in the South caused by the Civil War. The subject of this sketch was educated at the University of Tennessee and admitted to the bar in 1885, notwithstanding that circumstances obliged him to leave the university in his junior year and earn his living as a clerk of the United States Circuit Court. He practised law in Chattanooga till 1892, when he came to New York and opened a law office. In 1898 he

formed a law partnership with Mr. William McAdoo (a native of Ireland and no relation whatever), who in 1910–1930 was chief city magistrate, and had been assistant secretary of the Treasury under President Cleveland. The partnership was dissolved in 1903.

McAdoo had gained some experience in railroad work by running a street railway in Knoxville, an undertaking which proved a failure. In 1902 he organized the Hudson and Manhattan Railroad Company and raised 4 million dollars to connect New York City with New Jersey by tunneling under the Hudson River. Work on this project had been begun in 1878, but was abandoned. McAdoo's company completed the project; the first tunnel being completed on March 8, 1904, and three more being finished in the next five years.

McAdoo also began participating in activities of the Democratic Party, and supported Woodrow Wilson in the 1910 gubernatorial campaign in New Jersey. He became vice chairman of the Democratic National Committee in 1912 and following Wilson's election to the presidency became secretary of the Treasury, March 6, 1913. McAdoo then devoted himself to the enormous financial transactions in which the government was involved during World War I. The floating of the four Liberty Loans, which brought in some 43 billion dollars in 1913–1919, and the financing of allied belligerents were among his accomplishments as secretary of the Treasury, but he was also chairman of the Federal Reserve Board, the Federal Farm Loan Board, the War Finance Corporation, and the United States section of the International High Commission. When the government took over the nation's railroads on Jan. 1, 1918, McAdoo was appointed director general of railways. He resigned from the Treasury on Dec. 16, 1918, and as director of railways, Jan. 10, 1919. On May 7, 1914 McAdoo married Eleanor Randolph Wilson, the president's daughter. They were divorced in 1934.

The former secretary was twice a candidate for the Democratic nomination for the presidency: in 1920, when he led with 266 votes on the first ballot, but lost to James Middleton Cox after Alexander Mitchell Palmer had released his delegates to the latter; and in 1924, when he led with 431½ votes on the first ballot, but was overtaken and deadlocked by Alfred E. Smith; both being defeated by John W. Davis. McAdoo then moved to Los Angeles, where he practiced law. In 1933 he was elected to the United States Senate from California, supporting the New Deal policies of President Roosevelt and specializing in legislation concerning banking and finance. He was defeated for renomination to the Senate in 1938 and retired from political life at the end of his term (1939). He wrote *The Challenge; Liquor and Lawlessness Versus Constitutional Government* (1928), and *Crowded Years* (1931), an autobiography ending with his resignation from the cabinet.

McADOO, măk'ădōō, borough, Pennsylvania; in Schuylkill County; altitude 1,800 feet. It is situated 41 miles northwest of Allentown, and is served by the Lehigh Valley and the Pennsylvania railroads. There are rich deposits of anthracite in the area, and coal mining is the principal industry. Other industries of the borough are the manufactures of paper boxes and textiles. There are waterfalls nearby, and much picturesque scenery. The borough was founded in 1880; incorporated in 1896. Pop. (1950) 4,260.

McAFEE, măk'ă-fē, **Mildred Helen** (married name, HORTON), American educator: b. Parkville, Mo., May 12, 1900. She was educated at Vassar and the University of Chicago. She was dean of women and professor of sociology, Centre College, Danville, Ky., 1927–1932; dean of women, Oberlin College, 1934–1936; and president of Wellesley College, 1936–1949. In 1942 she became the first director of the women's naval reserve (WAVES) with the rank of lieutenant commander, 1942–1943; with rank of captain, 1943–1946. In 1945 she married Rev. Douglas Horton.

MACAIRE, mă-kâr', a French *chanson de geste* of the 12th century, and one of the great poems of the Middle Ages. One of its themes—a favorite of the Middle Ages—is that of the wife unjustly accused of infidelity; in *Macaire* it is the queen of Charlemagne, here called Blanchefleur. The same story is told in another *chanson de geste,* of the 14th century, *La reine Sibille,* in which Charlemagne's queen appears under the name of Sibille.

Macaire, however, is a fusion of two tales, the second being that of the dog that brings the murderer of his master to justice. This tale may be found in Plutarch's *Moralia,* in which a dog remains by the body of his slain master for three days and reveals the identity of the murderers by attacking them. In *Macaire,* Aubry de Montdidier is murdered in the Forest of Bondy by Macaire, a French knight. Aubry's dog, named Dragon, shows such hatred of Macaire that suspicion is aroused and Macaire and the dog are summoned to single combat. Although Macaire is armed with a heavy stick, the dog overcomes him and he confesses his guilt.

Dragon was also called the *chien de* (dog of) *Montargis,* either because the murder was committed near the castle of Montargis, or because the story was depicted on the chimney of the great hall in the castle in the 15th century. Jean de la Taille in his *Discours notable des duels* (1607) says the encounter with the dog took place under Charles V in 1371.

La reine Sibille exists only in fragments, although there is a prose version extant. *Macaire* is preserved only in the Franco-Venetian *geste* of Charlemagne (Manuscript 13, Library of St. Mark), in a mixed form of French and Venetian dialects. It was reprinted by François Guessard, *Anciens poètes de la France* (1866); Gaston Paris, *Histoire poétique de Charlemagne* (1865); Léon Gautier, *Les epopées françaises* (1865–1868); and Paulin Paris, *Histoire littéraire de la France* (1873).

Dramas.—A melodrama on this subject, *Le chien de Montargis,* was written by R. C. Guilbert de Pixérécourt, and was translated and played at Covent Garden, London, in 1814. A later melodrama, *L'auberge des Adrets* (1823) by Benjamin Antier, seems to owe little to the *chanson de geste* except perhaps the name of the murderer and bandit, Robert Macaire. In the creation of this role, the French actor Frédérick Lemaître made his reputation. In a sequel, the comedy *Robert Macaire* (1834), written by Antier and Lemaître in collaboration, the hero is a reformed murderer and now a swindler. In this work, which followed the Revolution of

July 1830 in Paris, Théophile Gautier saw "the great triumph of revolutionary art." "Frédérick Lemaître," says Gautier, "created in the character of Robert Macaire a kind of humor that is almost Shakespearean. In it we find terrible gaiety, sinister laughter, bitter derision, pitiless raillery and a biting sarcasm, mingled with elegance, suppleness and astonishing grace. Robert Macaire and Bertrand [his accomplice] are Don Quixote and Sancho Panza in crime." Such was its popularity that Honoré Daumier executed a series of about 100 drawings depicting Robert Macaire as banker, lawyer, journalist, and so forth.

McALESTER, măk-ăl'ĕs-tĕr, city, Oklahoma; seat of Pittsburg County; altitude 750 feet. It is situated 83 miles south-southeast of Tulsa and is served by the Chicago, Rock Island and Pacific and the Missouri-Kansas-Texas railroads. There is a municipal airport. The surrounding area includes much fertile farmland, producing cotton, corn, livestock, dairy products, and peanuts. There is also timber-producing forest land. Coal is mined, and oil and natural gas wells are important. The city processes cotton, cottonseed, soybeans, peanuts, and petroleum, and there are meat-packing establishments, and manufactures of aluminum products and concrete.

J. J. McAlester, pioneer settler for whom the city is named, founded a store at a crossroads in what is now North McAlester in 1870, and with the aid of Chickasaw and Choctaw Indians developed the coal deposits. North McAlester was incorporated in 1899. South McAlester was organized civically in 1900, and they were consolidated, as McAlester, under a city charter in 1906. Government is by mayor, commissioners, and city manager. Pop. (1950) 17,878.

MACALESTER COLLEGE, a liberal arts, coeducational institution in St. Paul, Minn., founded in 1885 under the auspices of the Presbyterian Church. It grants the degree of A.B. in liberal arts and business administration. The average enrollment of students is about 1,500.

MACALISTER, măk-ăl'ĭs-tĕr, Sir **Donald,** Scottish physician and anatomist: b. Perth, May 17, 1854; d. Cambridge, Eng., Jan. 15, 1934. He was educated at Liverpool Institute and St. John's College, Cambridge, and was a fellow of St. John's from 1877 until his death. Macalister studied medicine at Cambridge, at St. Bartholomew's Hospital, London, and in Leipzig. He practiced and lectured at Cambridge, and in 1907 was appointed principal of Glasgow University. He held this office until 1929, when he resigned, becoming chancellor of the institution. He was created a baronet in 1924.

Macalister was chairman of the committee which prepared the *British Pharmacopoeia* (1898) and its revision (1914). He was the author of the medical works, *Nature of Fever* (1887) and *Antipyretics* (1888). Macalister was also an accomplished linguist and published *Echoes* (1907), a volume of verse translations. His interest in gypsy lore resulted in *Romani Versions* (1928).

MACALISTER, Robert Alexander Stewart, Irish archaeologist and historian: b. Dublin, July 8, 1870; d. Cambridge, Eng., April 26, 1950. He was educated in Dublin, in Germany, and at Cambridge University. He was director of excavations of the Palestine Exploration Fund, 1900–1909 and 1923–1924, and professor of Celtic archaeology at University College, Dublin, 1909–1943. From 1926 to 1931 he was president of the Royal Irish Academy.

Among Macalister's publications are *Studies in Irish Epigraphy* (3 vols., 1897–1907); *A History of Civilization in Palestine* (1912; 2d ed., 1921); *Muiredach, Abbot of Monasterboice, His Life and Surroundings* (1914); *The Life of Ciaran of Clonmacnois* (1921); *A Text-Book of European Archaeology* (1921); *Ireland in Pre-Celtic Times* (1921); *The Secret Languages of Ireland* (1936); *The Book of the Taking of Ireland* (4 vols., 1938–1941); and *Monasterboice, Its History and Monuments* (1946).

McALLEN, măk-ăl'ĕn, city, Texas; in Hidalgo County; altitude 122 feet. It is situated in the lower Rio Grande Valley, 50 miles west-northwest of Brownsville, and is served by the Missouri Pacific and the Southern Pacific railroads. McAllen is a port of entry from Mexico; being connected by road—by way of Hidalgo, Texas, and Reynosa, Tamaulipas—with Monterrey, Mexico. Citrus fruits, cotton, and truck garden crops are grown on irrigated land around the city, and there are oilfields. McAllen's chief industry is the canning, freezing, and dehydrating of foodstuffs; petroleum is refined, and chemicals and canvas products are manufactured. The city was settled in 1904, incorporated as a town in 1910; as a city in 1927. Government is by mayor and council. Pop. (1950) 20,067.

McALLISTER, măk-ăl'ĭs-tĕr, **Addams Stratton,** American electrical engineer: b. Covington, Va., Feb. 24, 1875; d. Clifton Forge, Va., Nov. 26, 1946. He was educated at Pennsylvania State College and Cornell University. After serving with private concerns, he taught electrical engineering at Cornell, 1901–1904, and in 1905 became associate editor of the *Electrical World.* He was editor of that publication, 1912–1915. During this period he was also lecturer on engineering at Pennsylvania State College, 1909–1914. In 1917 he became an adviser to the Council of National Defense, and after World War I became connected with the Bureau of Standards as electrical engineer, 1921–1923; engineer-physicist after 1923; assistant director of the bureau, 1930–1945.

McAllister was the inventor of alternating-current electrical machinery, and formulated the law of conservation as applied to illumination engineering calculations. He contributed many papers to technical journals and was the author of *Alternating Current Motors* (1906) and *Standard Handbook for Electrical Engineers* (1907).

McALLISTER, Samuel Ward (called Ward), American social leader: b. Savannah, Ga., December 1827; d. New York, N. Y., Jan. 31, 1895. He came of a family several of whose members were prominent at the bar. With his father, in 1850, he went to California to establish a law firm, remaining until 1852, when he had made a comfortable fortune. Moving to New York, he married Sarah Gibbons, the daughter of a wealthy Georgian. He lived in Europe for several years, and when he returned lived most of the time at Newport, R. I. He entered social life in New York with the advan-

tages of personal qualifications and family prestige. As a raconteur as well as an accomplished gourmet he had already attained prominence within a select circle when, by a well-turned remark, he became the leader of leaders in New York society, which, according to his strict limitation, included but 400 persons. The popular expression «The Four Hundred» originated from this assertion of McAllister's. He made contributions to the press, which, however, impaired rather than strengthened his unique position, as did also his volume 'Society as I Have Found It' (1890).

McALLISTER, Fort. See FORT McALLISTER.

MACALLUM, Archibald Byron, Canadian educator: b. Belmont, Ontario, in 1859. After receiving his education in the Toronto and Johns Hopkins universities he became lecturer on physiology (1887) and professor in the medical faculty of Toronto University (1891–92). From 1892 to 1901 he was associate professor in the arts faculty there and full professor after 1901. In 1895–97 he was president of the Canadian Institute. In 1901 he was made a Fellow of the Royal Society, Canada, and in 1906 of the Royal Society of London. In 1911 he was elected president of the American Society of Biochemists. He published scientific articles in the *Journal of Physiology, Proceedings of the Royal Society Quarterly Journal of Microscopical Science, American Journal of Morphology* and *Journal of Anatomy and Physiology.* D. 5 April 1934.

McALPINE, William Jarvis, American civil engineer: b: New York City, 30 April 1812; d. Staten Island, N. Y., 16 Feb. 1890. Completing his elementary education at schools in Newburgh and Rome N. Y., young McAlpine was apprenticed at the age of 15 to John B. Jervis, civil engineer. He remained with Jervis for eight years as apprentice, assistant and resident engineer, and, in 1836, succeeded Jervis as chief engineer of the eastern division of the Erie Canal. Several years later, he became chief engineer of the government dry dock in Brooklyn, N. Y., and with the completion of that difficult project, found himself well established in his profession. From 1852–57 he served as state engineer and railway commissioner of New York, and, during his tenure of office, made a number of important studies on comparative costs of rail and water transportation. As chief engineer of the Third Avenue drawbridge over the Harlem River, New York (1860–61), Mr. McAlpine pioneered in the design and sinking of the caissons for the piers. He later acted as chief or consulting engineer in the building of a number of the nation's largest bridges, among them the Eads Bridge, over the Mississippi at St. Louis; the Clifton suspension bridge at Niagara; and the Washington Bridge spanning the Harlem in New York City. He also directed the construction of the New York State Capitol at Albany in 1873, and later, as engineer of parks for New York City, built the famous Riverside Drive. At the time of his death, he was planning an «arcade railway» which was to provide an underground transit system for New York City, as well as second level streets beneath the more congested thoroughfares. Although remarkable in its conception and in many respects practicable, McAlpine's plan met with much opposition from property owners and was later abandoned. He was well known in professional circles in Europe and in England, and was consulted on a number of major projects, among them the Manchester Ship Canal, a proposed railroad to India, and improvement of navigation of the Danube River near the «Iron Gate.» For many years he was the only American who could claim membership in the British Institution of Civil Engineers. He was elected president of the American Society of Civil Engineers in 1870, and honorary member in 1889. Mr. McAlpine was a frequent contributor to technical publications, and in addition to reports and a number of original papers, he wrote a textbook, 'Modern Engineering' (1874). At the time of his death he was the acknowledged dean of his profession, and one of the last of the «general practitioners» of civil engineering.

McANENY, George, American civic administrator: b. Greenville, N. J., 24 Dec. 1869. He was graduated at the Jersey City High School in 1885 and entered journalism, serving on the staff of several New York newspapers from 1885 to 1892. From 1892 to 1894 he was assistant secretary of the Civil Service Reform League, of which he became secretary in 1894. He held this position until 1903, serving on committees that drafted the municipal home-rule section of the state constitution in 1894 and the state Civil Service Law in 1899. In 1902 he was a member of the New York Civil Service Commission and also of the commission to revise the city charter in 1908. In 1903–06 he read law with Edward M. Shepard. In 1906–09 he was president of the City Club of New York; in 1910–13 he was president of the borough of Manhattan, and in 1914–16 president of the board of aldermen (fusion ticket), and was active in obtaining municipal markets for New York City. In 1902 he drafted the civil service rules now in force in New York City; was a member of the commission appointed by the governor to revise the New York City charter (1908); chairman of the transit committee of the New York board of estimate and apportionment, which, with the Public Service Commission, developed New York's subway system, and chairman of committee on city plan 1914–16. From 1916 to 1921 he was executive manager of the New York *Times,* resigning in the latter year to become a member and chairman of the New York Transit Commission. Following the abolition of this body in 1926 he resumed his position with the New York *Times.* In 1913 Paris gave him the medal of the Société des Architectes Diplômes par le Gouvernment Français for services to city planning and architecture in the United States. Vice-president, Hampton Association National Municipal League, and president of the New York Kindergarten Association. In 1914 he was Dodge lecturer at Yale. The lectures were published under the title of 'Municipal Citizenship' (New York 1915). In 1924 he was Day Foundation lecturer at Union College.

MACAO, mä-kow' or mä-kä'ō, China, a Portuguese settlement and seaport on the west shore of the mouth of the Canton River, 40 miles west of Hongkong. It occupies a high peninsula, formerly the island of Macao, but now united by a narrow isthmus north of the town with the island of Hiang-shan, and, with

the small islands of Taipa and Colôane, forms a province. The settlement is about eight miles in circuit, and its limits landward are defined by a barrier wall stretching across the isthmus, where a guard of Chinese troops is stationed to prevent foreigners from trespassing on the Inner Land. The town occupies a slope gradually descending to the sea, backed by a range of lofty hills, and having an extensive plain stretching east. It is nearly surrounded with water, and is open to the sea-breezes on every side. The houses occupied by the foreign population are large, roomy and open, and the shops are numerous. The city is divided into two wards, one inhabited by Chinese and the other by non-Chinese, each with its own administrator. The quay or «Praya Grande» is commodious, forms a pleasant drive and is protected by a battery. The harbor is formed between the peninsula on which the town stands and the large island of Twee-lien-shan, to the west. Macao is considered the healthiest residence in southeast Asia with a mean annual temperature of 74°. Near it, in a beautiful garden, is the grotto in which the poet Camoens is said to have finished the 'Lusiad.' The principal exports are tea, cassia and cassia oil, anise and anise oil, fish, and opium. The commerce (mainly in the hands of the Chinese), which is chiefly carried on with Hongkong, Canton, Batavia and Goa, has greatly declined since the opening of the rival free ports, and a considerable part of the colonial revenue is drawn from a tax on the gambling tables for which Macao is notorious. Imports in 1936 were valued at 15,723,585 patacas; exports at 9,143,627 patacas. (Pataca = 34 cents.) Trade is controlled by Chinese. The Portuguese first obtained permission to form a settlement and to trade at Macao in 1557. From 1563 they were required to pay a yearly tribute to the Chinese government, and their trading privileges were much restricted till 1844, when they were allowed to carry on commerce with the five ports then open to foreigners. Macao was then declared a free port, but the Chinese continued to ignore the territorial claims of the Portuguese until 1887 when a treaty was concluded. Macao from its convenient situation was the place of retreat for European merchants and missionaries when threatened by uprisings of race or religious feelings in China. Robert Morrison, the first Protestant missionary in China, was buried here. Pop. about 200,000 (4,000 Portuguese).

MACAPA, mä-ka-pä, Brazil, town on the delta of the Amazon, 110 miles from the mouth of that river. It has a fine harbor with fortifications. The exports are chiefly timber and fine woods for the furniture trade. Pop. 4,000.

MACAQUE, ma-kăk', one of the small, short-tailed Asiatic monkeys of the genus *Macacus* and family *Cercopithecidæ,* which are so docile, intelligent and interesting as a rule that they are common in menageries and frequently kept as pets; their gentleness and playfulness disappears as they grow old, however, and they are then likely to become morose and savage. They go about in troops, keeping by themselves, and differing from other monkeys in most of their actions and cries. Some of the best known are the quaintly crested capuchin or bonnet-monkey (*M. sinicus*), excessively common and pestiferous in southern India; the entellus monkey (q.v.) of northern India; the large pigtailed (*M. leoninus*) of Japan, whose likeness is seen in numberless Japanese drawings and carvings. Ranging over so wide a variety of countries, their habits and food differ greatly. Besides the fruit, juicy leaves and insects eaten by most monkeys they devour small reptiles, young birds, frogs and crabs, the last-named forming the principal diet of a Malayan species (*M. cynomolgus*). One species is isolated in the mountains of Algeria and Morocco, whence they were long ago carried, probably first to Gibraltar, where they are known to the English of the garrison as «Barbary apes» (*M. inuus*), and the small band upon the Rock are carefully protected from harm.

MACARIANS, name given to the followers of the monastic customs of the elder Macarius of Egypt, or of the younger Macarius of Alexandria, contemporary monks of the 4th century who were noted for their austere rule. The name was also given to the followers of the Monothelite Macarius, patriarch of Antioch in the 7th century.

MACARONI (Ital. *maccheroni*), a peculiar paste or dough prepared from wheat flour and manufactured into tubes or ribbons. It is an Italian invention, and, though made by a simple process, has never been produced with so great success in any other country. The grain grown in the more southern countries of Europe is said to possess a greater amount of gluten, and is therefore better adapted to this manufacture. The wheat, after being washed, is freed from the husks and ground in water mills, when hot water is added till it is of the consistency of stiff dough. Five different qualities of flour are obtained by an equal number of siftings, the last giving the finest and most delicate that can be made. To reduce the dough to tubes or ribbons a hollow cylindrical cast iron vessel is used, having the bottom perforated with holes or slits. When this is filled with the paste a heavy iron plate is driven in by a powerful press, which forces the paste through the holes and gives it the shape of the perforations, the workman cutting off the pieces of the desired length as they come through. During this process it is partially baked by a fire made under the cylinder. Sometimes the flat pieces are formed into tubes by uniting the edges before they are thoroughly dry. After being hung up for a few days they are ready for use. The largest tubes are called *maccheroni,* the smaller *vermicelli* and the smallest *fedelini.* Macaroni is prepared for the table by boiling and baking with grated cheese, and is in common with vermicelli and the other varieties much used in the preparation of soups. Since about 1880 the use of macaroni in the United States has largely increased, and where it was once only consumed by Italians in this country, it is now eaten by all classes. Numerous macaroni factories have been established in New York and elsewhere. The United States imports annually from Italy over 5,000,000 pounds of macaroni.

MACARONIC VERSE (It. *maccheronico,* relating to macaroni, from *maccheroni,* macaroni), a type of humorous poetry in which modern words, given Latin endings, are introduced into Latin verse. The name is also given

to poetry which is merely a mixture of Latin (in some cases Greek) and the vernacular of the author. Macaronic verse is said to have originated with Teofilo Folengo (1491–1544), a learned Benedictine monk, who left his monastery and lived a worldly life, supporting himself by writing ridiculous poetry under the pseudonym of Merlin Coccai. His *Liber Macaronicus* appeared in 1517 and was highly successful. One authority states, however, that Folengo was only the popularizer of this verse form, which was originally invented by his teacher, Odaxius of Padua (born c. 1450). The term macaronic was chosen with reference to the mixture of ingredients which go into the making of the food macaroni. Folengo's *Liber Macaronicus* greatly influenced Rabelais' work, *The Voyage of Pantagruel*, and was imitated by a number of minor Italian poets. In France in 1573, Antonius de Arena (Antoine de la Sable) published a mock epic on Charles V's campaign in Provence, after the style of Folengo's poem. Molière made use of macaronic verse in *Le Malade imaginaire*. Macaronic prose, however, is very rare. It is thought that this form of poetry might have been suggested by the barbarous Latin used by the monks.

Consult Genthe, F. W., *Geschichte der Macaronischen Poesie* (Leipzig, Halle, 1836); Sandys, William, *Specimens of Macaronic Poetry* (London 1837); Morgan, J. A. ed., *Macaronic Poetry* (New York 1872); Brunet, J. C., *Littérature macaronique* (Paris 1879); Dobson, W. T., *Literary Frivolities* (London 1880); Sullivan, Sister Carmeline, *Latin Insertions and the Macaronic Verse in Piers Plowman* (Washington, D. C., 1932); Wehrle, W. O., *The Macaronic Hymn Tradition in Medieval English Literature* (Washington, D. C., 1933).

MACAROON, a small, rich, usually glazed cooky, formerly a French delicacy, now frequently baked from simple recipes. Principal types of macaroons are made from combinations of such ingredients as almond paste or extract, coconut, flaked cereal, flour, egg whites, sugar, and salt.

MacARTHUR, Arthur, United States Army officer: b. Springfield, Mass., June 2, 1845; d. Milwaukee, Wis., Sept. 5, 1912. He entered the service during the Civil War as a first lieutenant in the 24th Wisconsin Infantry, in August 1862, and thereafter saw action in the battles of Perryville, Stone River, Dandridge, Franklin, and in the Atlanta campaign. He was mentioned in dispatches for gallant and meritorious service, and in 1890, was awarded the Congressional Medal of Honor for bravery in the battle of Missionary Ridge (1863). By the end of the war, he had been brevetted a colonel of the regiment. In February 1866, he entered the regular army, and from then until 1886, was stationed in the West and Southwest, where he took part in several Indian campaigns. In May 1898, shortly after the beginning of the Spanish-American War, he was appointed brigadier general of volunteers, and assigned to the Philippines. In August of that year, he was commissioned major general of volunteers. In 1899, under Gen. Elwell Otis, he led a division against Aguinaldo, and in 1900, was appointed commander of the Division of the Philippines, and succeeded General Otis as military governor of the islands. He was promoted to brigadier general in the regular army in January 1900, and in 1906 was made assistant chief of staff of the United States Army, with the rank of lieutenant general. During the Russo-Japanese War, he was detailed as a special observer with the Japanese Army (1905). He was retired from active service in June 1909. Lieutenant General MacArthur was the father of General Douglas MacArthur (q.v.).

MacARTHUR, Douglas, American general: b. Little Rock, Ark., Jan. 26, 1880. It is generally agreed that General MacArthur possesses one of the outstanding military records in modern history. Son of the late Lieut. Gen. Arthur MacArthur (q.v.), a distinguished army officer, Douglas MacArthur began his military career in 1899 when he was admitted as a student to West Point. He graduated in 1903, having attained the highest scholastic average of any student in 25 years. Commissioned second lieutenant in the Corps of Engineers, he served in various capacities in the Philippines, Japan, Mexico, and army schools until 1913–1915 and 1916–1917, at which times he served on the general staff. In August 1917, with the rank of colonel, he became chief of staff of the 42d (Rainbow) Division, which he had helped to form. During World War I he served in the Champagne-Marne and Aisne-Marne defensives, and in June 1918, after being made brigadier general, he commanded the 84th Infantry Brigade in five offensives. From November 1918 to April 1919 he was with the Army of Occupation in Germany and then returned to the United States Military Academy where he held the post of superintendent until 1922. Here he modernized the academy's military training and broadened the curriculum to include a full collegiate education. From 1922 to 1925 he served in various Philippine commands, returned to the United States for three years as major general in command of corps areas with headquarters at Baltimore and Atlanta, and in November 1930, he was named by President Hoover as chief of the general staff of the United States Army, with rank of general, the youngest officer to hold that rank since Grant. During his term of office, he was responsible for reorganizing the defense program, increasing the size of the air corps and the number of enlisted personnel, and speeding up the army's mechanization. He also favored coordination of air and ground forces. In 1935, at the request of the Philippine president, he was appointed military adviser to the Philippine Commonwealth government, for which he organized the islands' defenses and built up a native army. From June 1936 to Dec. 31, 1937, when at his own request he was placed on the army's retired list, he served as field marshal of the Philippine Army. He was recalled to active service on July 26, 1941, commissioned lieutenant general, and appointed commanding general of the Far East Command. On Dec. 8, 1941, he was named commander in chief of United States armed forces in the Far East, with the rank of full general. He led American and Filipino troops against the Japanese, but was forced to abandon Manila on Dec. 26, 1941, retreating to Bataan Peninsula. Here he made the two-months defense which won for him the respect of military experts and the affection of the American people. In March 1942, under orders from President Roosevelt, he surrendered his command to Maj. Gen. Jonathan M. Wainwright, and was evacuated to Australia, where he was appointed commander in chief of Allied forces in the Southwest Pacific area. During 1942 the forces under his command defeated the Japanese in the Coral Sea, waged the Battle of Midway, began the

Solomon Islands campaign, and dislodged the Japanese from Buna and Gona. In March 1943 General MacArthur announced the destruction of a 22-ship Japanese convoy advancing on New Guinea, and in July, with Admiral William F. Halsey, he launched a joint offensive in the Southwest Pacific. Under MacArthur's personal leadership, his forces invaded the Philippine island of Leyte on Oct. 20, 1944; three months later they invaded Luzon, and by July 5, 1945, the liberation of the Philippines was completed. Previously, in December 1944 he had been given the five-star rank of general of the army and in April 1945, he had been given command of all United States Army forces in the Pacific. In August 1945, on President Truman's orders, he arranged the terms of Japanese capitulation and on Sept. 2, aboard the U.S.S. *Missouri* in Tokyo Bay, accepted Japan's formal surrender to the Allies. He was then designated Supreme Commander of the Allied Powers in Japan. After five years of Allied occupation of Japan, General MacArthur stated that he believed Japan had achieved a new "political reorientation" and that the country was ready for membership in the "family of free nations." On June 25, 1950, his program in the Pacific was expanded when the South Korean Republic was invaded by forces from North Korea. On that day the United Nations Security Council issued cease-fire orders and asked United Nations countries to enforce the order. Two days later President Truman ordered the United States air and naval forces under General MacArthur's command to help repel the North Korean invaders, and on June 29 General MacArthur reached South Korea to organize its defense. He requested and received authorization to send "supporting ground units" from Japan to Korea, to permit the Air Force to lift its bomber line above the 38th parallel, and to order the Navy to blockade the entire Korean coast. On July 8, 1950, after a majority of the U.N. Security Council had agreed, President Truman appointed General MacArthur commander of U.N. forces fighting in Korea under the United Nations flag.

On April 11, 1951, General MacArthur was dismissed by President Truman from his United Nations, Allied, and American commands in the Far East. The president charged MacArthur, who had made public demands for a more extensive war against the Chinese Communists, with being "unable to give his wholehearted support to the policies of the United States Government and of the United Nations." The general's ouster, the most sensational in American military history, set off a vigorous internal controversy in the United States. MacArthur highlighted a history-making return to the United States by addressing a joint session of Congress on April 19, 1951. Having accepted an offer to join the Remington-Rand Company, he delayed assuming his business post until July 31, 1952 when he was installed as chairman. Meanwhile he made the Republican National Convention keynote address, castigating the Truman administration. Though supporting the Taft candidacy, he received 10 votes in the first roll call.

MacARTHUR, Duncan, American soldier and political figure: b. Dutchess County, N. Y., Jan. 14, 1772; d. near Chillicothe, Ohio, 1839. His family removed in 1780 to the western frontier of Pennsylvania, and at 18 years of age he went to seek his fortune in the wilderness, and participated as a ranger or scout in the warfare with the Indians in Kentucky and Ohio, until the victory of General Anthony Wayne in 1794 gave peace to the Western country. In 1796 he was married, and settled near Chillicothe, Ohio, as a surveyor and land speculator. In 1805 he became a member of the Ohio legislature, and in 1808 was appointed major general of the state militia. In the War of 1812 he received the commission of brigadier general in the army, and in 1814 succeeded General William Henry Harrison in command of the army of the West. After the war, as a joint commissioner with General Lewis Cass, he negotiated the treaty with the Indians of Ohio for the sale of their lands in that state, which was ratified in 1818. He served intermittently in the Ohio legislature (1815–30), and in 1823–25 was a representative in Congress from that state. In 1830 he was elected governor of Ohio.

McARTHUR, John, Jr., American architect: b. Bladenock, Wigtownshire, Scotland, May 13, 1823; d. Philadelphia, Pa., Jan. 8, 1890. He came to the United States as a child and was apprenticed to his uncle, a Philadelphia carpenter. He later studied drawing and design at the Franklin Institute under Thomas U. Walter, architect and teacher. Thereafter, young McArthur had much practical experience in his chosen field as apprentice and later as foreman and superintendent. At the age of 26, he won first prize for a design of a building for the House of Refuge at Philadelphia. He soon became well established as an architect, and designed many important buildings, both public and private. Among them were the Public Ledger Building, the George W. Child's mansion, both in Philadelphia; buildings at Lafayette College in Easton, Pa.; and the State Asylum for the Insane at Danville, Pa. During the Civil War, he worked for the United States government, and was architect of the naval hospitals at Mare Island, Annapolis, and Philadelphia. Some of his finest work was done in the construction of the Philadelphia City Hall or Public Buildings, at one time one of the two largest public buildings in the United States.

MacARTHUR, Robert Stuart, American Baptist clergyman: b. Dalesville, Quebec, July 31, 1841; d. Daytona Beach, Fla., Feb. 23, 1923. Graduated from the University of Rochester (1867) and from Rochester Theological Seminary (1870) he served from May 1870 to September 1911 as pastor of Calvary Baptist Church, New York, when he resigned to assume the presidency of the Baptist World Alliance. He went to Russia to secure from the czar's government permission to buy land at St. Petersburg on which to erect a Baptist Bible college, a project which the outbreak of World War I made impossible. He later went to Burma as president of the alliance to assist in celebrating the centennial anniversary of Adoniram Judson's mission work. He was connected editorially with the *Christian Inquirer* and *Baptist Review.* His publications include *Current Questions for Thinking Men* (1898); *Divine Balustrades* (1898); *Quick Truths and Quaint Texts* (1898); *Lectures on the Land and the Book* (1899); *The Celestial Lamp* (1899); *Old Testament Difficulties* (1905); *The Baptists* (1911); *and The Question of the Centuries* (1921).

McARTHUR, William Pope, American naval officer and hydrographer: b. Ste. Genevieve, Mo., April 2, 1814; d. aboard ship Dec. 23, 1850. In February 1832 he was appointed midshipman in the United States Navy, spent several years in the South Pacific station, and later attended the naval school at Norfolk, Va. During the second Seminole War (1837–1838) he commanded one of the vessels in the expedition to the Everglades. He was assigned to duty with the United States Coast Survey in 1840, and in the following year, took part in the survey of the Gulf coast. Promoted lieutenant in 1841, in 1848 he commanded the hydrographic party that made the first preliminary survey and reconnaissance of the Pacific coastline from Monterey to the Columbia River. He died of acute dysentery as his ship entered Panama Harbor on the return voyage.

McARTHUR, town of southern Ohio, the seat of Vinton County, 75 miles southeast of Columbus, on the Chesapeake and Ohio Railway. Local clays provide raw materials for brick-making, the town's chief industry. Fruit and vegetables are grown and stocks raised in the surrounding area; there also are a coal mine and oil and gas wells in the vicinity. McArthur was platted in 1815 and incorporated in 1851. Pop. (1950) 1,466.

MacARTHUR, P. I. See ORMOC.

MACASSAR or **MAKASSAR,** mȧ-kăs'ẽr, seaport and capital of the province of Sulawesi (Celebes), United States of Indonesia. It lies on the west coast of the southern peninsula of the island of Celebes, at the southeast end of Macassar Strait separating Celebes from Borneo. It is served by the coastal railroad and is the site of an airport. Its natural harbor has been improved in 1925 and is the port of call of cargo ships from Europe and other parts of Asia; here imported goods are transshipped to smaller boats serving the other ports of Celebes, New Guinea, and the Molucca Islands. Teakwood, vegetable oils, coffee, spices, gums and resins, and rattan are exported. There are few Europeans, but a large Chinese group. The climate is very hot and humid and the vegetation of the surrounding area is of the tropical rain-forest type. Macassar consists of the Dutch town and port, Vlaardingen, the center of the European and Chinese trade, and of the Malay town, which lies inland. Vlaardingen dates in part back to the times of the East India Company, but contains also broad avenues and modern constructions. The port is dominated by old Fort Rotterdam, originally built by the Portuguese; in front of it is a wide square surrounded by government buildings.

The new museum contains a valuable collection of objects illustrative of the native arts and industries, arms, costumes, and jewelry. The native Macassarese and Bugi are branches of the Malay people, and the Makassar language is one of the most important of the Malay group. The Portuguese claim to have visited Macassar as early as 1512, but their first permanent settlement is probably of much later date. During the 17th century the Dutch came often in conflict with the sultan of Macassar and with the Portuguese; in 1667 the sultan submitted, then the Portuguese were driven out and the Dutch East India Company won complete control. All attempts by the British to supplant the Dutch were unsuccessful and the Dutch have remained masters until the end of World War II. In 1946–1950 Macassar was the capital of the state of East Indonesia and parliament convened here in 1947. Pop. (1930) 84,855.

MACASSAR OIL, the trade name for an unguent that made its appearance in England early in the 19th century. It took its name from the district of Macassar, where it was first produced, being pressed from the fruit, or seed, of the *Schleichera trijuga,* the East Indian kusum tree. This fixed vegetable oil is used by the natives for cooking, illuminating and for medicinal purposes. The name is now given to a pomade made of almond, olive or peanut oil, to which other substances are added to give color and perfume. The original Macassar oil became so well known that Byron spoke of it as "Thine incomparable oil, Macassar," and Lewis Carroll alludes to it in the "Song of the Man Sitting on the Gate" in *Through the Looking-glass.* So general was its use that in England a covering was specially made to throw over the back of a chair or sofa as a protection from the grease in the hair; and to these coverings the name antimacassar was given. Antimacassars were at first made of white cotton in crochetwork, and were stiff, hard, and uncomfortable; but in the third quarter of the 19th century they were simpler and more artistically worked in colored wools or crewels, or colored silks in pretty patterns. In the United States the word "tidy" was used to describe the article.

MACASSAR STRAIT, arm of sea between Celebes and Borneo islands, United States of Indonesia, connecting the Sea of Celebes with the seas of Java and Flores; through it is the most direct route from Java to the Philippine Islands. It reaches a width of almost 250 miles in the south, while in the north it is only 80 miles wide; the depth is mostly 3,000 feet, except an area in the north where it reaches almost 10,000 feet. Macassar is the most important harbor. Here on Jan. 23, 1942, took place the naval engagement in which American and Dutch warships and planes opposed a Japanese armada of some 100 ships in the Strait of Macassar between Borneo and Celebes. In the battle, which raged for five days and nights, the Japanese lost over 30 ships sunk or damaged, including one battleship and an aircraft carrier, and between 25,000 and 30,000 men drowned. Although Japanese losses were high, the battle proved to be principally an Allied delaying action, and in February of that year Japanese forces again advanced on Java, established bases on both sides of Celebes, and occupied Amboina Island, second most important naval base in the Dutch East Indies, and Timor, north of Australia.

MACAULAY, mȧ-kâ'lĭ, **Catharine Sawbridge,** English historian: b. Wye, Kent, April 2, 1731; d. Binfield, Berkshire, June 22, 1791. In 1760 she was married to George Macaulay, a London physician. She was an ardent Republican and a great admirer of Washington, with whom she corresponded, and whom she visited in 1785. She published a *History of England from the Accession of James I to that of the Brunswick Line* (8 vols., 1763–1783), once very popular and eulogized by Pitt in the House of Commons, but now neglected.

MACAULAY, James, Scottish novelist: b. Edinburgh, 22 May 1817; d. there, 20 June 1902. He was educated at the University of Edinburgh and for 35 years was in the service of the Religious Tract Society as editor-in-chief. In 1851–57 he was joint editor of the *Literary Gazette* and in 1858 became editor of the *Leisure Hour Sunday at Home. The Boy's Own Paper* and *The Girl's Own Paper* were founded by him. He was a voluminous writer, and among his published works the following may be mentioned: 'Across the Ferry; First Impressions of America and its People' (1871); 'Memory Helps in British History' (1873); 'All True: Records of Adventure' (1879); 'Luther Anecdotes' (1883); 'Gordon Anecdotes' (1885); 'Livingstone Anecdotes' (1886); 'Wonderful Stories of Daring, Peril and Adventure' (1887); and 'Victoria, Her Life and Reign' (1887).

MACAULAY, Sir James Buchanan, Canadian jurist: b. Niagara, Ontario, 3 Dec. 1793; d. Toronto, 26 Nov. 1859. He was an ensign in the British army during the War of 1812, and subsequently studying law was admitted to the bar in 1822. In 1829 he was appointed a judge of the King's Bench, from 1849 to 1856 he was chief justice of the Court of Common Pleas, and just prior to his death became judge of the Court of Error and Appeal. He was knighted in 1859.

MACAULAY, Thomas Babington, English essayist, historian and statesman: b. Rothley Temple, Leicestershire, 25 Oct. 1800; d. Holly Lodge, Kensington, 28 Dec. 1859.

Macaulay was the son of Zachary Macaulay, a Scotchman of remarkable character, who achieved distinction by his life-long advocacy of the abolition of slavery and by his efficiency, as a young man, in the governorship of Sierra Leone, the colony of African freedmen. The family removed to Clapham, then a suburb of London, where much of Macaulay's youth was spent. Hannah More was a friend of the family and she encouraged the lad as a writer and presented him with books to start his library. Young Macaulay was regarded as a prodigy, and his memory was something startling. He attended school near Cambridge under a Mr. Preston; his range of reading, particularly in poetry and fiction, was immense, but his taste for mathematics and the exact sciences steadily declined. In October 1818 he entered Trinity College, Cambridge, and in the citadel of mathematics his aversion for this study became pronounced. Twice he gained the Chancellor's medal for poetry, and he displayed classical attainments, but was «gulphed» in mathematics. However, after a third trial, he won a Fellowship in 1824. His mental training was thus one-sided; and a certain lack of philosophical grasp and a dislike of facing abstruse intellectual problems became thus characteristic.

The association with his college mates, rather than his studies, left the deepest impression upon Macaulay. His great friend was Charles Austin, whose influence converted the young Tory into an uncompromising Whig. He shone in the Union Debating Society, developing powers that afterward became conspicuous in the House of Commons. Politics he had heard discussed from early childhood in the circles which gathered round his father's table, and along with literature politics was his abiding passion. At college he had competed for a prize in history on the subject which he developed fuller in later years: «The Conduct and Character of William III.»

Before leaving the university he began writing for publication in *Knight's Quarterly Magazine* (1823). Two lyrics, 'Ivry' and 'Naseby' still live; but the most important contribution was the ingenious 'Conversation between Mr. Abraham Cowley and Mr. John Milton, touching the great Civil War.' It seems likely enough that the freshness and delicacy revealed in this early work became injured by the author's entrance into the rougher world of political strife. On the other hand, it may be maintained that Macaulay's gifts were preeminently those of the man in public life, and to him literature, always a delight, was nevertheless really but an avocation.

Macaulay's father unexpectedly became financially involved. Full of courage, the son began tutoring while still at Cambridge, and cheerfully assisted in supporting his sisters. Ultimately, together with his brother, he paid off all his father's obligations.

Macaulay was called to the bar in 1826 and joined the Northern circuit; but soon gave up the law for politics. Interestingly enough, his entrance into politics came by way of literature. In August 1825 appeared the essay on 'Milton,' the first of the series that Macaulay contributed to the *Edinburgh Review,* which, for the next 20 years, made both him and the *Review* famous. Jeffrey, the editor, expressed his frank wonder as to where Macaulay «picked up that style.» Upon Jeffrey's resignation Macaulay was offered the editorship, but he was not willing to leave London. Papers on 'Machiavelli' (1827), 'Dryden,' 'History' and 'Hallam's Constitutional History' (1828), followed, and soon after controversial articles on James Mill, Sadler and Southey, which revealed the declared Whig. Their reputation introduced him into both social and political life. He was made commissioner of bankruptcy in 1828 and in 1830, Lord Lansdowne, who had been favorably impressed by the attack on Mill, offered Macaulay a seat in Parliament for Calne in Wiltshire which he held until in 1832 he was elected for Leeds.

His time of entrance into the House of Commons was propitious. It was just before the death of George IV and the accession of William IV, and consequently on the eve of the battle for the reforms of 1832. Macaulay was 30 years of age, was widely read in history and literature and was a ready and fluent speaker aflame with interest in public questions. In 1824 he had made a notable speech at a meeting of the Anti-Slavery Society; later, in the discussion for Catholic emancipation, he headed a coachload of M.A.'s from London to Cambridge, arriving in time to vote down a petition in the university senate against the act. He now threw himself ardently into the struggle for reform and took an honorable part in the fight from beginning to end. His Parliamentary success was immediate. «Whenever he rose to speak,» Mr. Gladstone testified, «it was a summons like a trumpet-call to fill the benches.» His earliest effort was on the removal of the civil disabilities of the Jews, which he followed by an essay on the subject in the

Edinburgh Review (January 1831). On the emancipation of slaves in the colonies he never wavered, but stood unflinchingly true to his father's principles. He offered to resign his position with the ministry rather than yield his views on this subject; but the question was satisfactorily settled and his resignation not accepted.

Meanwhile he found time to write. The essays on 'Byron, 'Johnson' and 'Hampden' appeared in 1831; 'Burleigh' and 'Mirabeau,' in 1832; 'War of the Succession in Spain' and 'Horace Walpole,' in 1833, and the first essay on 'Chatham,' January 1834.

His appointment in 1832 as a commissioner of the Board of Control was followed by absorption in East Indian affairs, and in 1833, when the charter of the East India Company was renewed, he was offered a position on the East Indian Council with a salary of £10,000 per annum for five years. His brilliant career in Parliament was seemingly permanently endangered; but Macaulay did not hesitate. He estimated that he could save half his salary and in five years have a competence. He needed money on account of his father's poverty, for the sake of his two sisters, as well as for his own career; and he accepted, going out in 1834 and returning in 1838. The genius for government which the father had displayed at Sierre Leone, the son now manifested at Calcutta. His important permanent reforms were the creation of the Indian Penal Code and the Code for Criminal Procedure, achieved in the face of bitter local opposition, and the organization of a sound educational system.

Macaulay's family ties were very strong and there is no record of any love affair in his life. A sister, Jane, had died in 1830, and his mother in 1831. One of his favorite sisters, Margaret, was married in 1832, an occurrence which he accepted as a source of personal distress. The other, Hannah, accompanied him to India, and there she met and was shortly married to Charles Trevelyan, an officer in the government service. Macaulay was much pleased with the match, and the two households lived together under the same roof. Ever afterward, as the young Trevelyans, his nieces and nephews, grew up, they became a very real part of Macaulay's life. His love for children, and particularly for these, was a marked trait, and one of them afterward filially wrote his uncle's biography. Meanwhile his sister Margaret had died in England, and likewise his father died while Macaulay and the Trevelyans were on their homeward voyage. These deaths affected him deeply, and the home-coming was a sad one.

While in India he made opportunity for an immense amount of reading, particularly of the Latin and Greek classics, to which he returned with increasing delight. He also read widely in Italian and French, and did some German on the return voyage. His love for the great poets, dramatists, orators and historians affected his culture, his style and his ideals. The lists of his reading from now to the end of his life became a part of his biography and would stock a good library. His long walks with a copy of Homer or Virgil, from which he was reading or spouting, became an accustomed sight. Thenceforward he determined that he would write a history in emulation of Thucydides and Tacitus and Livy, and his set speeches caught something of the spirit of Lysias and Cicero.

Upon his return to England he left for a tour in Italy, revelling in its beauties and associations with the enthusiasm of a first visit and the eye of an historian and student of Latin and Italian literatures. The literary fruits were the 'Lays of Ancient Rome.'

Returned home, he sincerely hoped to begin his 'History of England,' which he had planned to write from the Revolution of 1688 to the death of George III. Had he begun it then, with 20 years of life to devote to it, he might easily have left 10 or more volumes covering the century instead of the first five extending through but 15 years — a brilliant fragment. But he was again dragged into politics and Macvey Napier, editor of the *Edinburgh Review*, made heavy draughts upon his time.

In India he had contributed but two essays to the *Review*, that on 'Mackintosh's History' and the very long one on 'Bacon.' However, his experience furnished him the material for the brilliant narratives on 'Clive' (1840) and 'Warren Hastings' (1841). Besides these in the six years after his return he contributed 'Sir William Temple' (1838) — written in an entirely fresh spirit; 'Gladstone on Church and State' (1839); 'Von Ranke's History of the Popes' (1840); the 'Comic Dramatists of the Restoration' and 'Lord Holland' (1841); 'Frederick the Great' (1842); 'Mme. d'Arblay' and 'Addison' (1843); 'Barère' and the second essay on the 'Earl of Chatham' (1844). This, perhaps his noblest essay, proved to be his last. He was forced to give up writing in order to find time for his 'History.' His complaisance in continuing to write for the *Review* had undoubtedly worked to his detriment. But the entrance into politics was only in part due to the exigencies of his friends; for public life exercised a subtle fascination over him.

In 1839 he was elected member of Parliament for Edinburgh and was made Secretary at War with a seat in the Cabinet. Fortunately the ministry soon expired, and his freedom from official duties gave him some leisure. He retained, however, his seat for Edinburgh, and his most important work was the Copyright Bill, which, after many radical suggestions, passed in almost the exact terms in which he advocated it.

In 1842 the 'Lays' appeared and achieved a great success despite the natural fears of friends. «Christopher North» of *Blackwood's*, who had attacked Macaulay on account of the Southey reviews, made up — on poetry they could agree. In 1843 the 'Essays' were collected and published. There had been a constantly growing demand for them in a permanent form, which their author at first resisted. They had been written at odd moments of leisure, and he regarded them as ephemeral, but copies were being introduced from America, and Macaulay had to consent. The sale proved their popularity to be a permanent one. Macaulay's Essays still are unapproached of their kind, as condensed booklets of knowledge. An analysis of their contents shows how their author's mind was revolving constantly upon a definite period of English history — the Revolution and the consequent development under constitutional government, the subject he set

for himself in writing his 'History'— and these are uniformly among his best. Those on foreign subjects and the controversial ones are less satisfying.

The 'History' had been delayed year after year for lack of leisure to begin actual work. At length the first two volumes appeared in 1849. They comprised the reign of James II and the Revolution, but reproduced the setting as a whole and included details at once picturesque and dramatic such as could only be drawn by a supreme master of narrative. Macaulay had set for himself high ideals; he wished to be read and to be understood; he sought to give a series of brilliant mental pictures; and he achieved what he set out to do. He is weakest, perhaps, on the side of ethical interpretation, in searching out the causes and setting forth the nexus of events; his narrative is brilliant and effective, but it has the supreme fault in a history of being entirely lacking in detachment of view. In opinions he represented the great middle class and the world of Whiggism and its mode of thinking; in many things, Philistine; in some things, even vulgar; where mysticism and all esoteric systems of philosophy and kindred schools of poetry were accounted as foolishness.

The popularity of the 'History' was something enormous, surpassing even that of Byron's poems and of Scott's and Dickens' novels. In 1849, in consequence of this success, Macaulay was made rector of the University of Glasgow and Fellow of the Royal Society. He had been appointed trustee of the British Museum in 1847. He declined a professorship of history at Cambridge, and steadily refused positions under the government which would take up his time.

He had represented Edinburgh in Parliament for eight years, when in 1847, on account of his characteristic independence in voting for the Maynooth grant — for the maintenance of a Catholic university in Ireland — he offended many Edinburgh electors, and was not returned at the polls. He accepted his defeat with relief, and turned the more eagerly to the 'History.' In 1852, without any solicitation on his part and with a steady refusal to give pledges, he was returned voluntarily by the electors of Edinburgh to his former seat. Under such circumstances he felt he could not refuse election; but the duties it involved aided in sapping his strength, and that year he had a spell of illness from which he never wholly recovered.

In 1853 his speeches were collected and published. In 1855 the third and fourth volumes of his 'History' appeared. Macaulay feared for their success after the splendid reception accorded to the former two; but the new subject was the life and career of William of Orange, his favorite hero, he had worked hard to sustain himself and 26,500 copies were sold in 10 weeks. In 1856 he withdrew from the House of Commons; and in 1857 he was made a peer, and chose the title, Baron Macaulay of Rothley, from his birthplace. Likewise this year he was made a foreign member of the French Academy, member of the Prussian Order of Merit and high steward of Cambridge. In 1858 he wrote five short biographies for the eighth edition of the Encyclopedia Britannica — Atterbury, Bunyan, Goldsmith, Johnson and Pitt. These show greater compactness and maturity in judgment than his earlier treatment of the same themes.

In 1856 he left his bachelor quarters in town, at The Albany, and leased a pleasant villa, Holly Lodge, Campden Hill, Kensington. In 1859 his brother-in-law, now Sir Charles Trevelyan, was appointed governor of Madras, and the thought of the separation bore heavily upon him. Fortunately his sister and the children remained behind a while longer. Macaulay had not been well for some time, and he died at Holly Lodge, 28 December. On 9 Jan. 1860, he was buried in Westminster Abbey in the Poets' Corner at the foot of Addison's statue.

A fifth volume of the 'History,' concluding the reign of William III, had been completed, was edited posthumously by Lady Trevelyan and appeared in 1861. See MACAULAY'S ESSAYS; LAYS OF ANCIENT ROME.

Bibliography.— The official life, written by George (afterward Sir George) Otto Trevelyan (his nephew), appeared in London in 1876, and is generally conceded to be one of the best biographies in the English language. Consult also Lord Avebury, 'Essays and Addresses' (London 1903); Bagehot, Walter, 'Literary Studies' (ib. 1879); Canning, 'Lord Macaulay and his History' (ib. 1822); Hughes, D. A., 'Thomas Babington Macaulay the Rhetorician: an Examination of his Structural Devices' (Ithaca, N. Y., 1898); Macgregor, D. H., 'Lord Macaulay' (London 1901); Viscount Morley, 'Critical Miscellanies' (ib. 1877); Morrison, J. Cotter, 'Macaulay' in the 'English Men of Letters' (ib. 1882); Spedding, 'Evenings with a Reviewer' (ib. 1881).

J. B. HENNEMAN,
Late Professor of English in the University of the South.

MACAULAY'S ESSAYS. Macaulay did not originate the essay of literary and historical criticism. But Macaulay's essays so far surpass all others in brilliancy, style and solidity of matter that his name ranks with those of Bacon and Montaigne, each a master in his own special field. Macaulay's first published articles, written while he was still in residence at Cambridge University, appeared in Knight's *Quarterly Magazine* in 1823 and 1824, and from that time until his death in 1859 he wrote two score essays for the *Edinburgh Review* and many articles for the 'Encyclopædia Britannica.' The subjects he wrote upon were many — Dante, Dryden, Mill on Government, Mr. Robert Montgomery's poems, Moore's Life of Byron, Lord Bacon, Von Ranke, Leigh Hunt, Frederick the Great, Madame d'Arblay, Barère, etc., but by far the greater number deal with poets and men of letters or political personages in English history. Perhaps his most famous essays are those on Lord Clive, Warren Hastings and William Pitt, but others that deal with men of letters, Addison, for instance, or Samuel Johnson, are just as brilliant.

Macaulay's essays are set off by all the arts of rhetoric; they are ornamented by all the resources of omnivorous reading and a marvelous memory; they sparkle with a youthful enthusiasm, and are compact of sound information. In their own class they have no rivals. They are books to be taken on a long sea voyage, to be put on the shelf of a lonely ranchman, to be read and reread by all who have any taste for

literature. Pick up the essay on Addison and you are delighted with the tender sympathy of the critic who can set forth a good man's character in so generous and beautiful a manner. Read that on Croker's edition of 'Boswell's Johnson,' and you not only derive pleasure from Macaulay's admiration for Johnson, but you also get a lively idea of what the editor of a biography should not do. Take up any essay you please and you find knowledge, wit, sympathy, admiration; you are delighted to find with what extraordinary ease you acquire information, and how your horizon rapidly reaches out as if you were going up in a balloon, how places and things once so dark become enveloped in light as if the sun were rising, how great historical events seem to have been familiar to you from boyhood and how eminent personages, hitherto unknown, leap into your sudden intimacy.

Thus to delight, in form, and exhilarate the reader is a wonderful feat, and for nine men out of 10 Macaulay's essays are wholly satisfactory. They give a busy man what he wants to get from history and literature; but the 10th man finds himself not wholly satisfied. He feels oppressed by the arts of rhetoric. These animated pages, paragraphs, sentences that advance upon him, rank by rank, marshaled according to the most brilliant rules of tactics and strategy, trouble his spirit. Not a single sentence, here or there, appears in undress uniform. Such prose affords no room for subtleties. And the author's dogmatism rings in our ears like a trumpet in a room; this world of ours so full of perplexities, uncertainties, obscurities, cannot be truly expressed in opinions of absolute definiteness. History, literature, art, are not mathematics; a column of figures adds up the same for all; but William of Orange, James the Second, Archbishop Laud, Alexander Pope, Francis Bacon, must seem different to different people. We need, in literature, in history, light and shade, we need twilight and even night; high noon all the time is intolerable. It seems unlikely that all right views on English politics, during the 17th, 18th and 19th centuries, were embodied in the Whig creed, that all the good in religion is with the Protestants and none with Roman Catholics, that a comparative estimate of national characters summed up in the phrase "as the Italian is to the Englishman, as the Hindoo is to the Italian, as the Bengal is to other Hindoos," etc., should not need explanations and qualifications. And why should a historical writer, all the time, be giving his personages good or bad marks for conduct, like a village schoolmaster?

Such faults certainly exist. Macaulay had the temperament and the manner of an orator. He took, or rather he inherited, a view, he accepted it unquestioningly with enthusiasm, even with passion, he expressed that view in as absolute and as lucid a manner as possible. He had the method of an orator whose oration will be heard but once, and who must be positive in order to convince. This may be a merit in an advocate but it is a grave fault in a writer; and one would say that with such a fault it would be impossible for a man to be a great writer. But this very fault is proof of Macaulay's extraordinary talents; with his eloquence, with his immense fund of information, with his obvious honesty and his contagious enthusiasm, he is able to cover up and conceal what in any other writer would be fatal defects.

A man without doubts, without metaphysics, without high imagination, without dreams, cannot be one of the world's greatest writers; but Macaulay was a great English writer and occupies a place in which he not only has no rival, but no competitor who can be compared with him.

CARL E. EGGERT.

MACAULAY, Trevelyan's Life of. The authoritative biography of Thomas Babington Macaulay is the 'Life and Letters' by Sir George Otto Trevelyan. It is likely always to remain the chief source of information on account of the opportunity open to the biographer of knowing the subject thoroughly and of having free access to all available material. The writer is a nephew of Lord Macaulay, the son of Hannah More Macaulay, one of the historian's favorite sisters; from his earliest boyhood he knew his uncle intimately, and was 21 years old when Macaulay died in December 1859. Lady Trevelyan bequeathed to her son the task of writing his uncle's biography, a task that occupied many years, the completed work appearing in 1876.

The excellence of the work was recognized from the first. John Morley and William Ewart Gladstone approved it at once in extensive reviews, and succeeding years have detracted not at all from their judgments. Mr. Morley commended "the skill and candor with which Mr. Trevelyan has executed a very delicate and difficult task." Excellent and abundant materials and extensive knowledge do not necessarily ensure the production of a great biography. Nor do intimacy and strong affection; close relationship, indeed, is frequently the snare that prevents success. It is a tribute to Trevelyan's genius that he was not blinded by relationship or affection, nor overcome by the excess of material with which he had to deal. The biography exhibits careful selection. If now and then the loyal nephew is unable to see anything but good in the famous uncle, he nevertheless does not represent him as faultless; he admits that Macaulay had both limitations and prejudices. Trevelyan does not intrude himself unduly upon the narrative: he keeps our attention at all times chiefly upon Macaulay. Gladstone said that one of the greatest merits of Trevelyan's work is the fact that it has movement — life. And Gladstone was right. The biography is no lifeless transcript of facts; it is a characterization and an interpretation, possessing all the qualities of the best artistic work — proper perspective, proportion, gradation. The style is attractive and contributes much to the delight of reading.

Trevelyan adopted the method employed and established by Boswell, that of allowing the subject to tell, "as far as possible," his own story. The 'Life of Macaulay' is sometimes, to be sure, mentioned along with the 'Life of Johnson,' and there is no doubt that it has taken its place as one of the greatest English biographies. It is true, however, that with all of the advantages open to Trevelyan, he yet falls short of the success attained by Boswell. The 'Macaulay' contains no such record of conversation, no such variety of "exquisite personal touches," no such dramatic quality as the 'Johnson.' Neither does it so freely portray faults and foibles. Falling somewhat short of the 'Life of Johnson' in sheer artistry, it surpasses Lockhart's 'Life of Scott' in movement and concen-

tration. Morley was giving high yet just praise when he expressed the belief that this 'Life of Macaulay' would be read throughout the world with a curiosity and an interest only to be surpassed by the success of Lord Macaulay's own writings. Consult the review of the 'Life' by John Morley (in the *Edinburgh Review,* Vol. 143); and that by Gladstone (in the *Quarterly Review,* Vol. 142). WALDO H. DUNN.

McAULEY, Catherine, Irish founder and first superior of the Sisters of Mercy: b. Stormont House, County Dublin, Ireland, 29 Sept. 1787; d. Dublin, 11 Nov. 1841. In childhood she was adopted by a wealthy Protestant family who allowed her to remain in the church of her father, the Roman Catholic, and left her a large fortune which she wished to use for the benefit of the poor. She first erected a commodious house wherein might be taught a number of poor children, and where homeless young women might find lodging and board. This institution was opened in Dublin, 24 Sept. 1827, but the religious order was not established until 12 Dec. 1831. The members of the order take the vows of poverty, chastity and obedience; and the works which they perform are visiting the poor, sick and imprisoned, teaching, establishing hospitals, orphanages, homes for the friendless and other works of mercy. There are houses of her order in nearly all parts of the world. In the United States it comprises over 4,700 members. The order includes a college for young women, at Mount Washington, Md., a large number of academies, high and elementary schools and hospitals and orphanages in nearly every State in the Union. Consult Hartnett, 'Memoir of Mother McAuley'; Murphy, 'Sketches of Irish Nunneries'; Member of Order of Mercy, 'Life of Catherine McAuley.' See MERCY, SISTERS OF.

McAULEY, m'kä'lĭ, **"Jerry,"** New York City missionary: b. Ireland, in 1839; d. New York City, 18 Sept. 1884. He came to New York in 1852 and became a thief and prize-fighter. In 1857 he was sent to Sing Sing prison on a false charge of highway robbery, but was pardoned in 1864. He returned to his evil life. In 1872, having reformed, he opened a mission, "The Helping Hand," in Water street, a criminal neighborhood in New York. In 1882 he opened another mission, "The Jerry McAuley Cremorne Mission" and in 1883 began the publication of *Jerry McAuley's Newspaper.* He appealed with the greatest success to outcasts considered beyond redemption. After his death the work was continued by Samuel H. Hadley and John H. Wyburn. In 1912 a modern sanitary building was erected on the site of the first mission in Water street. Consult 'Jerry McAuley: his Life and Work,' autobiography edited by the Rev. Robert M. Offord (New York 1885).

MACAW, mă'kä', name given to 15 or more species of large, long-tailed and strong-flying parrots of gaudy coloring. They belong to the genus *Ara,* and are natives of the Western Hemisphere. They live on the mainland of America from Mexico to Paraguay, being especially abundant in Bolivia, where no fewer than seven (or nearly one-half) are found. They are also in Colombia and in Cuba. In the true macaws (*Ara*) the bony orbitical ring is complete and the lores (space between the eye and the upper mandible) and, to a greater or less extent, the cheeks are naked. One of the handsomest and best known is the Blue and Yellow Macaw (*Ara ararauna*), which enjoys an extensive range in South America from Guiana in the east to Colombia in the west and from Panama to Bolivia. A little over 30 inches long it has the upper parts blue, the forehead olive-green and the ear-coverts, sides of neck, breast and abdomen yellow-orange, while the wings and long tail are blue above and golden olive-yellow below. This bird is seen in almost every zoological garden and is often kept in private houses. It possesses a fairly good temper and grows much attached to those who tend it; but, like all other macaws, it persists in violent screaming. Salmon-fishers use its feathers for the making of artificial flies. Larger and even more gorgeously plumaged is the great Red and Blue Macaw (*Ara macao*), which is mainly scarlet-red both above and below, but with the back and upper and lower tail coverts pale blue, as are the wing-quills, while the shoulders and greater coverts are chrome yellow. The tail feathers are scarlet, the two central ones scarcely tipped with blue, the blue tips increasing in extent on the outer feathers, the three outermost being almost exclusively blue. The home of the Red and Blue Macaw extends from Mexico, through Central America, to Bolivia, Guiana and the Amazon Valley. It is usually seen in pairs, or in companies of pairs. It is also a common bird in captivity. The Red and Green Macaw (*Ara chloeoptera*), ranging from Panama to Brazil, has a shorter tail than the other two and is not so frequently met with in zoological gardens. It does not extend north of Panama. It differs from the Red and Blue in being of a darker red, or crimson, and having the middle wing coverts olive-green instead of yellow. The Green Macaw (*Ara milateris*) is green throughout, except for the presence of a scarlet patch on the forehead and blue on back, rump, wings and tail. It is 27 inches long and ranges from Mexico to Peru and Bolivia,—the most northern of all in distribution. It is well known in captivity. Colonel Grayson and other writers explain that this macaw is called "guacamayo" by the natives of Mexico and Central America, because they believe that it descends to the ground only once a year, and this in the month of May, when it searches the ground for a very hard-shelled palm-nut of which it is fond. This rather surprising statement is probably substantially true, as there seems no other reason why it should ever alight on the ground, where it would be exposed to much more danger than in the tree-tops, where it finds abundant food the year round. The tree of this nut the Mexicans call Ava, a species of *Nux vomica.* Both the milky sap of the tree, as well as the fruit, are deadly poison to any other creature but this parrot. The shell is exceedingly hard, but the enormous bill and powerful jaws of the Guacamayo enables it to split the nut with ease. When migrating to some distance these birds pass at a great height, flying in pairs and uttering harsh and discordant cries.

The Hyacinthine Macaw (*Ara hyacinthus*) of the central provinces of Brazil is a splendid bird. It is about three feet long, the plumage being nearly uniform cobalt blue, relieved by

bright yellow skin about the eyes and at the base of the lower mandible and a black bill which is of enormous size. This appears to be a rare species, occurring, according to Riker, about the inland ponds in the dense forests of the interior, where it feeds chiefly upon the fruit of a palm peculiar to these localities. Some of these palm fruits are of extraordinary hardness, but these birds crush them to pulp by their bills. The nesting habits of the Hyacinthine differ from those of other macaws in that they excavate a hole in the river bank for their nest instead of placing it in a hollow tree. In Spixi Macaw (*Cynopsittacus Spixi*), of the province of Bahia, Brazil, the lores are naked and the general color also blue; but parts of the head are more or less grayish.

All macaws live well in captivity and are often kept chained to a perch. Few persons are acquainted with their strong, wonderful and graceful flight. They all scream harshly. They are gregarious and apparently monogamous, and lay two lustreless white eggs in nests in hollow trees. One of their characteristics is a long and graduated tail with the individual feathers tapering to a point and the middle pair always the longest. The bill is powerful and usually deeper than long. Consult Greene, William Thomas, 'Parrots in Captivity,' with notes (3 vols., London 1884–87); id., 'Parrots in Captivity,' colored illustration (London 1884); Lear, Edward, 'Illustrations of the Family of Psittacidae, or Parrots' (folio, London 1832); Page, Charles N., 'Parrots and Other Talking Birds: their Foods, Care and Training' (Des Moines 1906).

MACAW TREE (*Acrocomia sclerocarpa*), a palm of the same family as the cocoanut. It is a native of the West Indies and of the warm parts of America. It grows from 20 to 30 feet high with pinnated leaves from 10 to 15 feet long. The fruit yields oil of a yellowish hue, sweetish taste and with an odor like violets. This oil is about the consistency of butter. In the native regions of the tree the inhabitants use this oil as an emollient for affections of the joints. It is extensively imported and is used in the manufacture of toilet soaps as palm oil. The leaves yield a fine, soft fibre. In Guiana the tree is called *Macoya,* in Brazil it is called *Macahuba,* in Jamaica *Grugru.* In southern California this palm is cultivated as an ornamental tree.

MACAYO, mä-sī-ō, Brazil. See MACEIO.

MACBETH, or MACBETHAD, Mac-Finlegh, king of Scotland, who reigned from 1040 to 1057. The facts of his life, so far as known, are these. During the reign of Duncan he was «mormaer» of Moray by inheritance, and by his marriage with Gruoch, granddaughter of Kenneth IV. Duncan, in his attempt to subdue the independent chiefs of the north, was defeated in a battle with the Earl of Orkney and Shetland at Burghead, near Elgin in 1040; but was murdered at Pitgaveny, nine miles from the battlefield, by Macbeth, his general. By this means Macbeth became king, and, according to accounts, his reign was fairly successful. He was finally defeated in battle and slain by Malcolm Ceannmor, son of the murdered Duncan, at Lumphanan, Aberdeen (1057). The legends which gradually gathered round the name of Macbeth were collected by John of Fordun and Hector Boece, reproduced by Holinshed in his 'Chronicle' (1577) and made use of by Shakespeare for his great tragedy. These writers appear to have overlooked the excellent qualities of Macbeth as king, and regarded him with horror as a usurper. Consult Robertson, 'Scotland under her Early Kings' (1862); Skene, 'Celtic Scotland' (1876–80), and Rhys, E., 'Celtic Britain' (3d ed., London 1904).

MACBETH. This play was not published until 1623, though it was probably written several years before Shakespeare's death. A reference to it in 1610 by Dr. Simon Forman, the probable reference to the accession of James the First (1603) that brought about the union of two crowns, and the proportion of rhyme, blank verse and prose, point to 1605–06 as the probable date. Because of its late publication the text is one of the most corrupt of Shakespeare's plays. It may have been taken down from the play as acted, or it may be a transcript of the author's manuscript which was in great part not copied from the original but written to dictation. Act 1, scene 2, and part of scene 3 may be an interpolation, but the Porter Scene, which was long considered to be the work of a collaborator, is now justified by reason of its dramatic contrast with the preceding scene and by the amazing felicity of such lines as, «go the primrose way to the everlasting bonfire.» With the exception of a few lines and scenes Macbeth is an example of amazing concentration — it has neither underplot, nor, with the exception of the Porter Scene, such comic scenes as are found in nearly all of the other tragedies of Shakespeare. It is shorter by some thousand lines than any other tragedy and moves along with the swiftness of a tempest. The 20 years of history become nine days of dramatic time, and so swift is the passage of time that it seems but a few hours.

Shakespeare was indebted for the main events of the play to Holinshed's 'Chronicles of Scotland.' The character and the story of Macbeth, partly historical and partly legendary, were drawn largely from this source, but the witches were the creation of Shakespeare's genius from the shadowy creatures of a crude folklore. There is just enough of the popular conception of supernatural creatures of evil to satisfy the demands of the age in which he lived, but he informed this popular and somewhat vulgar superstition with a moral significance suited to all ages alike. These invisible, unearthly creatures do not create the evil in Macbeth's mind; they only serve to bring into life-like reality the evil that is already there. They are an embodiment of the same forces as the thunder, lightning, rain — nature «red in tooth and claw» — that constitute the background for the evil forces that are at play in this drama. While the minor characters of the play, and especially Banquo, are adequately presented, the interest centres in Macbeth and Lady Macbeth, who while engaged in the same evil deeds yet reveal differences of temperament and character that afford the most significant dramatic contrasts. Lady Macbeth before the murder of Duncan displays firm, sharp, wiry, matter-of-fact intellect and energy of will; she becomes for the time being possessed by one thought, one ambition. She has no imagination to represent

for her the inevitable consequences of the murder. As soon, however, as the deed is done, her womanly nature asserts itself; her amazing self-control gives way, and remorse wells up in her conscience-tortured heart. She had denied the quality of her sex, only to find that the woman was stronger than the queen or the wife. Macbeth, on the other hand, is possessed from the beginning by a vivid imagination that visualizes the deed itself and falters at its contemplation. Deeper and deeper he plunges into guilt until a sort of world-weariness and sick despair settle upon his brooding spirit. In words as eloquent as Shakespeare ever wrote he pronounces a requiem upon his wife and summarizes his pessimistic indictment of old age and of life; life is to him but "a tale told by an idiot, full of sound and fury, signifying nothing." He dies with the harness on his back, the intrepid soldier that he has always been, but with a sigh that pierces to the depths.

EDWIN MIMS.

McBRIDE, măk-brīd, **Sir Richard,** Canadian statesman: b. New Westminster, British Columbia, 15 Dec. 1870, where his father held office; d. England, 1917. He was educated at Dalhousie University, Halifax, Nova Scotia, graduating in 1890, called to the bar in 1892, he practised his profession in Victoria. Entering politics he was elected in 1898 a Conservative of the provincial legislature. In 1900–01 he was Minister of Mines in the Provincial Ministry; in 1902–03 a leader of the Conservative opposition; in 1903 Premier and Minister of Mines; in 1906 a delegate to the Interprovincial Conference at Ottawa; and in 1907 a delegate to the Colonial Conference at London (England). In 1912 he was knighted. Consult Gregg, T. A., 'Richard McBride,' with portrait, *Canadian Magazine* (July 1904).

MACBRIDE, Thomas Huston, American educator and botanist: b. Rogersville, Tenn., 31 July 1848. After graduation at Monmouth College in 1869 he taught mathematics and modern languages at Lenox College from 1870 till 1878, in which year he became assistant professor of natural sciences. In 1884 he was made professor of botany and held this post until 1914 when he became president. From 1916 he was president emeritus. His specialty was fungi. Dr. Macbride had many degrees: Monmouth gave him A.M. in 1873; the University of Bonn the same in 1891; Lenox gave him Ph.D. in 1895; Monmouth that of LL.D. in 1914, and Coe the same in 1915. He was a member of many scientific societies, of the American Forestry Association, Iowa Park and Forestry Association and of the Society of Botanists of the Central States. He was also a Fellow of the Botanical Society of America. He published many of his lectures and addresses, contributed to the *Popular Science Monthly, Science,* etc., and was the author of a textbook on 'Botany' (1895) and 'North American Slime Moulds' (1899). He died 27 March 1934.

McBURNEY, măk-bèr'nĭ, **Charles,** American surgeon: b. Roxbury, Mass., 17 Feb. 1845; d. 1913. He was graduated at Harvard in 1866; and from the Columbia Medical School in 1870, and thereafter practised his profession in New York. He was professor of surgery in the College of Physicians and Surgeons, New York, and was visiting and consulting surgeon at Saint Luke's, the Presbyterian, Roosevelt, New York Orthopedic and other hospitals. He became widely known as a very skilful operative surgeon, and was Fellow or member of many medical societies of this country and Europe. He discovered "McBurney's point," which is pathognomonic of appendicitis. He was a world-wide authority on appendicitis. When President McKinley was shot, Dr. McBurney was summoned to Buffalo as consulting surgeon. He was a great teacher as well as a great surgeon.

McBURNEY, Robert Raikes, American religious worker: b. Castleblaney, Ireland, 31 March 1837; d. Clifton Springs, N. Y., 27 Dec. 1898. He came to the United States in 1854, and from 1862 was the general secretary of the New York Young Men's Christian Association. He was devoted to his work, and with the progress of years came to be recognized as the leading Y. M. C. A. secretary in the world.

McCABE, ma-kāb', **Charles Cardwell,** American Methodist bishop: b. Athens, Ohio, 11 Oct. 1836; d. New York, 19 Dec. 1906. He was educated at Ohio Wesleyan University. In 1860 he entered the Methodist Episcopal ministry, and in 1862 was appointed chaplain of the 122d Ohio Infantry. At the battle of Winchester he was captured, and held in Libby prison for four months, and soon after his release entered the service of the United States Christian Commission and succeeded in raising a large amount of money for its work. Later he became financial agent for Wesleyan University; and in 1884 was made secretary of the Methodist Episcopal Missionary Society. He was remarkably successful in raising large amounts of money for missionary purposes. He became a bishop of his Church in 1896, and in December 1902 was elected chancellor of the American University at Washington, D. C.

McCABE, James Dabney, American author: b. Richmond, Va., 30 July 1842; d. Germantown, Pa., 27 Jan. 1883. He was the son of James Dabney McCabe (1808–75), a Protestant Episcopal clergyman and writer, and was educated at the Virginia Military Institute. He began to write very early. At the beginning of the Civil War he published a pamphlet entitled 'Fanaticism and its Results, by A. Southerner' (Richmond 1860) and throughout the war he employed his pen effectively in the cause of the Confederates. Three martial plays were performed in Richmond in 1862–63 and his war-story, 'The Aide-de-Camp,' was issued in 1863. In 1863 he published a Christmas compilation called 'The Bohemian' and in 1863–64 edited *The Magnolia Weekly.* His war-poems were very popular, particularly 'The Sword of Harry Lee.' He wrote several biographies, including 'Life of Gen. Thomas J. Jackson' (Richmond 1863); 'Memoir of Gen. Albert S. Johnston' (1866); and 'Life and Campaigns of Gen. Robert E. Lee' (New York 1867). His other works are 'Planting the Wilderness' (Boston 1869); 'History of the Late War between Germany and France' (1871); 'Lights and Shadows of New York Life' (New York 1872); 'History of the Grange Monument,' published under the name of Edward Winslow Martin (Chicago 1874); 'Paris by Sunlight and Gaslight' (Philadelphia 1875); 'Centennial History of the United

States' (Philadelphia 1875); 'Pathways of the Holy Land' (1877); 'History of the Turko-Russian War' (1879); 'Our Young Folks Abroad' (Philadelphia 1881), and 'Our Young Folks in Africa' (1882). Besides these he was the author of several hundreds of short stories, essays and translations, and made a compilation of the romance and humor of the war called 'The Grayjackets' (1867).

McCABE, Joseph, British rationalist: b. England, 1867. He was educated at Saint Francis's, Manchester, at Saint Anthony's, Forest Gate and at the University of Louvain. In 1883 he became a Franciscan, was ordained a priest in 1890 and in 1895 became rector of Buckingham College. In 1896 he left the Roman Catholic Church and became a lecturer and writer on rationalistic subjects. His books include 'Twelve Years in a Monastery' (London 1897); 'Modern Rationalism' (1897); 'Abelard' (1901); 'Saint Augustine and his Age' (1902); 'Talleyrand' (1906); 'The Martyrdom of Ferrer' (1909); 'The Decay of the Church of Rome' (1909); 'The Evolution of Mind' (1910); 'The Empresses of Rome' (1911); 'The Story of Evolution' (1912); 'Goethe' (1912); 'The Empresses of Constantinople' (1913); 'A Candid History of the Jesuits' (1913); 'The Sources of the Morality of the Gospels' (1914); George 'Bernard Shaw' (1914); 'The Soul of Europe' (1915); 'The Kaiser' (1915); 'Crises in the History of the Papacy' (1916); 'The Romance of the Romanoffs' (1917); 'The Popes and Their Church' (1918); 'A, B, C of Evolution' (1921); 'Ice Ages' (1922); 'A Century of Stupendous Progress' (1925); 'Lourdes' (1925); '40 Big Blue Books' (1927); 'The Story of the Catholic Church' (1929). Chesterton devotes a chapter to him in 'Heretics' (1909).

MACCABEES, a famous family which battled for liberty in the 2d century B.C., when the Jews were persecuted by the Syrians under Antiochus IV, Epiphanes. Originally applied to Judas, the third son of the aged priest Mattathias, who began the revolt, the name was widened to include the family of Judas and his followers, in due course to be applied to all wrestlers for freedom in the Greek period of Jewish history. The word's origin has received various fanciful explanations, but the most probable etymology is from the Aramaic *maqquaba* (Judges iv, 21 and elsewhere) meaning «Hammer.»

The story of the Maccabean struggle belongs to the history of heroism in all ages. When Antiochus of Syria (175–164 B.C.) strove to impose Hellenism in its crassest form upon the Jews under his sway and Jerusalem was overrun, while pagan rites were ordered to be substituted for Jewish, a sacrifice to Zeus being offered (168) on the Temple altar, an aged priest at Modin, Mattathias, spurned the mandate, killed the royal messenger, and destroyed the altar. Then escaping with his five sons to the mountains, he raised the standard of revolt. Two years later he died, and Judas, the third son, was acclaimed leader. His skill and genius, joined to a religious fervor that was the secret of his strength, cleared away every obstacle, as he defeated in rapid succession the three Syrian generals, Apollonius, Seron and Gorgias, and later the regent, Lysias. In 165 he reconsecrated the Temple amid the exultation of the people — the festival of Hannukkah, in memory of this restoration is still observed by the Jews of every land. In 162 Lysias granted religious freedom but Judas resolved to fight on until political liberty was also attained. A year later he defeated Nicanor at Adasa, but shortly afterward he fell at Elasa, while resisting Bacchides with greatly superior forces.

The command was now assumed by his brother Jonathan, who was astute enough to secure the favor of the Syrian ruler and was made high priest (153). For a time he fought for Antiochus VI, who owed his crown to Tryphon, and succeeded so well as to awaken Tryphon's jealousy. He fell into his power at Ptolemais and was finally put to death (143). Simon, the last surviving son of Mattathias, became leader of the Jewish people. By his ability and force of character, he outwitted Tryphon and secured the independence of Judæa. In 141 he was appointed by the people hereditary leader and high priest. With him began properly the Hasmonean dynasty — the name being traced to an ancestor of the house Asamonaios (Josephus, Antiq. xii, 6); according to Wellhausen (*Phar. und Sadd.* x, Note 94) he was the grandfather of Mattathias. The first year of his reign marked the beginning of a new era (Seleucid year 170 = 143–142 B.C.). The country enjoyed much prosperity, its resources were greatly developed and the outlook was distinctly more favorable than at any previous period since the Exile. With a change of rulers in Syria, Antiochus (VII) Sidetes becoming king, Simon and two of his sons were murdered by his son-in-law who wished to curry favor with the new monarch. But the third son, John Hyrcan, escaped and succeeded to the throne, reigning 30 years with much ability. Partisan strife, however, disturbed the kingdom's peace and weakened its strength, with the constant clashing of Pharisee and Sadducee.

On the death of John Hyrcan (105), his son Aristobulus reigned for a year when his brother Alexander Jannæus became ruler (104–78), a man of considerable energy, in his persistent conflicts to extend and defend his realm. His sympathies were with the Sadducees, and once when officiating as high priest, some of the Pharisees in their anger threw at him and the attending Sadducees citrons which had been supplied for the Feast of Tabernacles. As punishment, he attacked them with his troops, killing 6,000. On his death his widow, Salome Alexandra, ruled (78–69), reversing his policy and making the Pharisees her favorites, the land enjoying peace and prosperous growth. Her eldest son, Hyrcan II, who lacked capacity, was made high priest. The younger, Aristobulus, stronger and abler, coveted the succession and organized an army to conquer Jerusalem, when Alexandra died and Hyrcan was willing to retire in his brother's favor.

At this moment a new factor appeared in the person of Antipater of Idumæa who sought to further his own designs. An appeal to Rome was made. Pompey resolved to settle the matter in his own fashion, at some slight which Aristobulus offered, entered Jerusalem and made Hyrcan II high priest and ethnarch, while his brother was carried a captive to Rome. And now the Roman yoke became firmly fastened. Antipater was made procurator in 47, with his

sons Phasæl and Herod governors of Jerusalem and Galilee. In 41 they became tetrarchs of Judæa. In 40, Antigonus, the sole surviving son of Aristobulus, was appointed king by the Parthians, in the swift changes of the day. But Herod who had escaped from prison, while his brother had committed suicide, was given the throne by the Romans (37 B.C.). In the same year Antigonus was put to death by Mark Antony and the Maccabean-Hasmonean dynasty ended.

ABRAM S. ISAACS.

MACCABEES, Book of the, a name given to several Apocryphal books of the Old Testament. Of the four or five thus termed, two were declared canonical by the Council of Trent (1546), are contained in the Vulgate, and among the Apocrypha of the English Bible. The three other books may be summarized: Book III is found in the Septuagint but not in the Vulgate, Book IV is included in some manuscripts of the Septuagint and of Josephus. Book V is merely a Syriac reproduction of the sixth book of Josephus' 'Jewish War' and is of no historical value.

First Book was the record of 40 years from the accession of Antiochus (175 B.C.) to the death of Simon (135 B.C.), and is composed after the model of the Old Testament historical style, terse, simple, and at times poetic and impassioned. The narrative is written with due proportion and in sympathetic tone. All events are dated in terms of the Seleucid era. It is generally admitted that the original was in a Semitic language, most probably Hebrew, to which both Origen and Jerome bear testimony. However, it is not impossible that they were acquainted with an Aramaic version or paraphrase. The Greek translation of the Hebrew was made at an early date and has alone survived. It bears all the marks of a literal translation, preserving the Semitic and at times the Hebrew idiom. The author, to judge from the book itself, was a pious and patriotic Jew: a Palestinian, to infer from his evident familiarity with the Holy Land and his want of knowledge as to the foreign lands mentioned. An admirer of the Maccabees and their military skill, he shows the influences of his day by omitting the words «God» and «Lord» as in the book of Esther, substituting «He» and «Heaven.» Owing to his omission of the disloyal priests, Jason and Menalaus, in striking contrast to the attitude of the Second Book, Geiger claims a Sadducee as its author, a view held by later authorities, even if Geiger's views as to its being a partisan document are not upheld. Opinions differ as to its precise date — Schürer tracing it to the first or second decade of the 1st century B.C., while Torrey dates it early, in the reign of Simon, a little after 135 B.C. The book is one of the most vivid and valuable sources extant for Jewish history.

Second Book, has a peculiar opening — two letters written by Jews of Palestine to brethren in Egypt, held by some to be spurious. The work itself, an abridgment of five books written by Jason of Cyrene, covers Jewish history from a period a year earlier (176 B.C.) than its predecessor to the death of Nicanor (161 B.C.). It is of special interest as picturing the situations in Palestine before the revolt of Mattathias and furnishing other data that are lacking in the First Book. The author, probably a Hellenistic Jew, writes largely from the religious point of view, is a Pharisee, with a direct partisan tendency. Greek was the original language. Its exact or approximate date cannot be fixed. Among its characteristics are allusions to angels and spirits, to resurrection and immortality — that the book concludes with the victory of Judas over Nicanor, indicates its aim — to arouse the Jew to observe the two Maccabean feasts, that of Dedication and of Nicanor. The incident of the mother and her seven sons, and other stories of martyrdom have given the book a value and power of its own, which appealed with special force to the Christians of the first four centuries, as Bevan states in his 'House of Seleucus' (1902, II 175).

Third Book describes the escape of the Jews from martyrdom in Alexandria in the reign of Ptolemy IV, Philopator (222–204 B.C.). It has no relation to the Maccabees, but doubtless its title was given later when all who suffered for the olden faith were called by that name. It was written by an Alexandrian Jew to give courage and endurance to his brethren in Egypt. In view of the fact that early Jewish settlements in the Fajum have been discovered. Both I. Abrahams and A. Büchler claim the book has distinct reference to a persecution in the Fajum — a theory that is disputed.

Fourth Book has been aptly described by Freudenthal (Breslau 1869) as a homily delivered probably on the Feast of Dedication to a Greek-speaking Jewish community. It is sermon not history, to prove how the passions can be controlled by the reason, by which term he means reason enlightened by religion and the Mosaic Law. This thesis is illustrated by many examples, notably from the Maccabean struggle. A Hellenist to a certain extent, he was nevertheless an earnest, loyal Jew, eloquent and convincing. His precise date is unknown. He supplied the model for similar homilies by Christian writers in the early centuries, with their thrilling martyrdoms. In the Church the book was attributed to Josephus and added to his writings, with whose style and language it is wholly incompatible.

Without historical value is the so-called *Fifth Book* which Cotton gives in his 'Five Books of the Maccabees' (1832), and known also as the Arabic 'Book of Maccabees' which claims to be the history of the Jews from 186 B.C. to the end of Herod's reign, but which in reality is nothing but a compilation from First and Second Books of Maccabees and Josephus. The manuscript of a 'Fifth Book' which Sixtus Senensis (1566) states that he saw in Lyons and which was subsequently lost by fire, is characterized by Schürer as a «reproduction of Josephus, the style being changed for a purpose.»

Bibliography.— Abrahams, I., 'J. Q. R.' (1896–97, IX, 39); Büchler, A., 'Tobiaden and

Oniaden' (Vienna 1899); Fairweather and Black, 'First Book of Macc. in Cambridge Bible Texts'; Grimm in 'Handbuch zu den Apokryphen'; Kacutzsch, 'Apokryphen'; Schürer, 'History of the Jewish People.'

ABRAM S. ISAACS.

MACCABEES, Knights of the Modern. See MACCABEES, THE.

MACCABEES, The Ladies of the, a fraternal beneficiary association, founded in 1886, formerly the Ladies of the Modern Maccabees. Until 1914 it formed a species of auxiliary organization to the Knights of the Maccabees and the latter exercised over it a kind of guardianship. It has about 50,000 members and since its institution has distributed about $7,000,000 in benefits and insurance.

MACCABEES, Ladies of the Modern. See LADIES OF THE MACCABEES.

MACCABEES, The, a fraternal beneficiary association having its general offices, at the present time, in the Maccabees Building, a 15-story structure on Woodward Avenue at the Art Center in the city of Detroit, Michigan. The former title of The Maccabees was the «Knights of the Maccabees of the World,» which was changed in 1914 to the simple title «The Maccabees.»

The society was organized in the city of London, Ontario, Canada, on 20 Aug. 1878, by W. D. McLaughlan and a few other interested men. The association grew rapidly, and its subordinate lodges sprang up all over the Canadian provinces and in the states of New York and Michigan. In 1914 it united with the Knights of the Modern Maccabees, which was the original organization. In 1926 the Ladies of the Modern Maccabees also united with the association, and in 1924 the society broadened its sphere of operation by the organization of a Ladies and Junior Department, so that it has now become a family protective institution.

The association derives its name from the ancient Maccabees, a chivalrous and religious people whose history is given in the writings of the Old Testament. The leading character in the history of the ancient Maccabees was Judas Maccabeus, considered one of the most valiant soldiers and one of the greatest military leaders of all time. During the wars in which the Maccabees were engaged and in which he was their leader, he required that a portion of the fruits of all their victories should be set aside for the benefit of the widows, the orphans, the disabled, and the dependents of those who had fallen in battle. It was this particular practice and characteristic that probably suggested to Mr. McLaughlan and his co-workers the name for the new society, for this practice characterizes The Maccabees of the present day.

The organization takes applicants from the day of birth up to their 60th anniversary, and it affords all kinds and character of legal reserve life insurance, hospitalization protection, old-age homes, visiting nurse service, and general relief service to its members under all the adversities of life. The main purpose of the association is to provide social and fraternal intercourse for its members, and benefits in the way of life insurance to the families of its deceased members.

The association has, during its entire history, paid in death benefits more than $230,000,000, and it has paid in old-age benefits and general relief benefits under its certificates in excess of $30,000,000. It has a large sick and accident department. The present assets of the association are in excess of $56,000,000, and it possesses a membership of 250,000. It works under the lodge system and ritualistic ceremonies, and its form of government is thoroughly democratic, every member having a voice in the conduct of its affairs, in the making of its laws, the election of its officers, and the fixing of their compensation through representatives chosen by the direct voice of the members. The general meeting of the law-making body (The Supreme Tent as it is called), is held once quadrennially. In the interim between the meetings of its governing body, its affairs are administered by a board of nine trustees, consisting of the Supreme Commander and eight others elected by the Supreme Tent.

One of the safeguards of the organization is its laws, providing that all investments must be made in municipal, state, provincial, and governmental bonds, or real estate including homes and only such real estate as has an earning capacity. The loans do not exceed 50 per cent of the appraised value of such property.

E. W. THOMPSON,
Supreme Commander.

MACCABEES, The Woman's Benefit Association of the, an adequate rate fraternal order for women with headquarters at Port Huron, Mich. Organized in 1892, as the Ladies of the Maccabees of the World, reorganized under its present name in 1915 and established in the United States and Canada, the order has 3,000 local bodies with 192,000 members and a reserve fund of $12,000,000; provides whole life, term and disability protection; 20-year plans; junior protection for children of members; sick, last illness and burial; and maternity benefits. It maintains a free hospital service in every state for needy sick.

McCALL, Edward Everett, American jurist: b. Albany, N. Y., 6 Jan. 1863; d. New York City, 12 March 1924. He was educated at the Albany High School and the New York University, was admitted to the bar in 1884 and practised in New York from 1884 till 1902. From that year until 1913 he was justice of the Supreme Court of New York (1st district) and Democratic candidate for mayor of New York in 1913, but was defeated by the late John Purroy Mitchel (q.v.).

McCALL, mą-kâl', **George Archibald,** American soldier: b. Philadelphia, 16 March 1802; d. 25 Feb. 1868. He was graduated at West Point in 1822; in 1836 reached the rank of captain, and that of colonel in 1850. Having served against the Seminoles in Florida, he won distinction in the Mexican War; in 1850 he became inspector-general, resigning from the army three years later. In 1861 he was given command of the Pennsylvania Reserves, with the rank of brigadier-general of volunteers, and participated in the work of the Army of the Potomac, particularly in the Peninsular campaign of 1862, in which he was engaged with his troops at Mechanicsville, Gaines' Mill and Frazier's Farm (qq.v.). At Frazier's Farm, 30 June, he was taken prisoner and was confined for several weeks in Libby prison. In August he was exchanged, but impaired health pre-

vented him from returning to the army, and in 1863 he resigned. He wrote *Letters From the Frontier* (1868).

McCALL, John Augustin, American insurance official: b. Albany, N.Y., 2 March 1849; d. Lakewood, N.J., 18 Feb. 1906. He was educated in his native city and served for several years as clerk in the Connecticut Mutual Life Insurance Company. In 1877 he entered the New York State insurance department in which he served as clerk, deputy superintendent and superintendent. In 1887 he was made comptroller of the Equitable Life Assurance Company and in 1892 became president of the New York Life Insurance Company. In 1905 the Armstrong insurance investigation led to his resignation in 1906 and he died two months after resigning.

McCALL, Samuel Walker, American public official: b. East Providence, Pa., 28 Feb. 1851; d. Winchester, Mass., 4 Nov. 1923. In 1874 he was graduated at Dartmouth College, studied law and was admitted to the bar in 1876 and practiced in Boston. He was editor-in-chief of the Boston *Daily Advertiser* in 1888–89 and served as delegate at the Republican National Conventions of 1888, 1900, and 1916. He was member of the Massachusetts House of Representatives in 1888, 1889, and 1892 and was a member of Congress from 1893 to 1913 from the 8th Massachusetts District. He was an unsuccessful candidate for the governorship of Massachusetts in 1914 but was successful the following year, being elected governor for 1916. He was re-elected for the two successive terms of 1917 and 1918. He published *Life of Thaddeus Stevens* (1899); *Dartmouth Centennial Address on Daniel Webster* (1902); *The Business of Congress* (1911); *Life of Thomas B. Reed* (1914); *The Liberty of Citizenship* (1915), and magazine articles.

MacCALLUM, William George, American pathologist: b. Dunnville, Ontario, 18 April 1874. He was graduated from the University of Toronto in 1894 and in 1897 was graduated from the medical school of Johns Hopkins University. In 1900–08 he was associate professor of pathology, and in 1908–09 professor of pathological physiology at Johns Hopkins University. In the latter year he became professor of pathology at Columbia University, where he remained until 1917 when he returned to Johns Hopkins University as professor of pathology and bacteriology. He was a fellow of the American Association for the Advancement of Science; a member of the Association of American Physicians; the National Academy of Sciences, and an honorary member of the Society Medicorum Sverana of Stockholm, Sweden. He wrote *Text-Book of Pathology* (1916), and was a frequent contributor to medical journals on pathological subjects. Died Baltimore, Md., 3 Feb. 1944.

MacCAMERON, mă-kăm'ĕr-ŏn, **Robert Lee,** American painter: b. Chicago, 1866; d. New York, 29 Dec. 1912. After studying in the public schools he began to make sketches for the newspapers in Chicago, and soon removed to New York, where he illustrated for newspapers and studied under William M. Chase. He then went to Paris and studied at the Beaux Arts under Gérôme and Collin. He became a successful portrait painter and for several years before his death kept studios in London, Paris, and New York. For his *Mi-Carême* he received honorable mention in the Paris Salon, and in 1912 he was made a chevalier of the Legion of Honor. He was a member of several foreign and American art societies. Among his best portraits are President Taft, President McKinley, Archbishop Ryan, Justices of the Supreme Court, Harlan and Brewer, Nellie Melba, and Auguste Rodin (Metropolitan Museum, New York). MacCameron also achieved reputation for his *cafés* and scenes in theaters. *A Group of Friends,* also called *Wormwood,* painted in 1908, is in the Corcoran Gallery, Washington; the *Daughter's Return,* painted in 1909, is in the Metropolitan Museum, New York. *Les Habitués* (*The Old Customers*) hangs in the Wilstach Gallery, Philadelphia. He also painted a religious picture, *The Last Supper,* in 1909. His last work was *The People of the Abyss* (1912). Consult *Harper's Weekly* (February 1913).

McCAMMON, Joseph Kay, American lawyer: b. Philadelphia, 13 Oct. 1845; d. 2 Jan. 1907. He graduated at Princeton in 1865; studied law; became register in bankruptcy in 1870; was special counsel of the United States in Washington, 1871; president of the board for investigation of the Indian service, 1877; assistant attorney general of the United States, 1880–85, and in 1881 was appointed United States commissioner of railroads. Under Presidents Garfield and Arthur he conducted treaties with various Indian tribes. Among his writings are a *Report on Indian Service* (1878); *Report of Councils with Bannock and Shoshone Indians* (1881); *Report of Councils with Flathead and Other Indians* (1882); *Arguments in Cases Affecting Pacific and Other Railroads.*

McCARREN, mă'kär'ĕn, **Patrick Henry,** American politician: b. East Cambridge, Mass., in 1849; d. Brooklyn, 22 Oct. 1909. In 1851 he removed to Williamsburg (Brooklyn, N.Y.) and was apprenticed to a cooper, but soon left trade and entered local politics. Before he was 21 he had been defeated for the leadership of his district. In 1881 he was elected to the New York Assembly and was re-elected in 1883 and 1887. In 1889 he was elected to the state Senate and was continuously a member of that body until his death. In 1893 he became virtually the leader of the Brooklyn Democrats. He broke with Charles F. Murphy, the leader of Tammany Hall, and from that time a bitter fight was kept up between these two politicians for the control of the Brooklyn Democrats. In 1904 one of the bitterest chapters in the history of New York politics occurred. McCarren also opposed W. J. Bryan and Charles E. Hughes. McCarren was a man of keen intellect and an aggressive fighter. He was identified with the Standard Oil Company and the American Sugar Company.

McCARTER, Margaret Hill, authoress; b. Charlottesville, Ind., 2 May 1860; d. 31 Aug. 1938. She taught in elementary schools in Indiana in 1876; graduated A.B. at the State Normal School, Terre Haute, Ind., in 1884; was principal of the High School, Rensselaer, Ind., 1884–87; held other educational positions to 1894, and was a lecturer of the State Board of

Education. She married, 5 June 1890, William Arthur McCarter, D.D.S., of Topeka, Kan. She became widely known by her fiction which is as popular in her State as that of William Allen White of Emporia. Her publications include 'The Overflowing Waters' (1903); 'The Cottonwood's Story' (1903); 'Cuddy's Baby' (1907); 'The Old Quirra' (1908); 'Cuddy and Other Stories' (1908); 'The Price of the Prairies' (1910); 'The Peace of the Solomon Valley' (1911); 'Vanguards of the Plains' (1917); 'The Reclaimers' (1918); 'Paying Mother' (1920); 'Widening Waters' (1924); 'The Candle in the Window' (1925).

McCARTHY, D'Alton, Canadian politician: b. near Dublin, Ireland, in 1836; d. Canada, 11 May 1898. He was the son of an Irish barrister who found a home for his family on the shores of Kempfendfeldt Bay, Ontario, after a six weeks' voyage in a sailing vessel. Educated at the Barrie Grammar School, he studied law and was called to the bar in 1858. In 1872 he was made queen's counsel, and attained high rank both in jury cases and appeal cases. In 1876 he was elected to the House of Commons as a Conservative and held this seat until his death, which was occasioned by a railway accident. He seceded from the Conservative party and aided the Liberals in opposing special legislation in the interest of Roman Catholic education. He was for a time president of the Canadian branch of the Imperial Federation League and a member of the Council of the British Empire League. Consult 'The Late D'Alton McCarthy, Q.C., M.P., an Appreciation,' by Amicus, *Canadian Magazine* (May 1903).

MacCARTHY, Hamilton Thomas, Canadian sculptor: b. London, England, 1847. He studied under his father and in Europe, and in 1885 removed to Canada. He lived in Toronto until 1898, when he took up his residence in Ottawa. He was distinguished for his capacity for expressing contemporary thought. The Royal Canadian Academy elected him a member in 1890 and councillor in 1906. Among his works are 'Burns and Highland Mary' (1877); the statue of Sir John H. Macdonald in Toronto; the bronze monuments for the South African War in Halifax, Ottawa, Charlottetown, Quebec and Brantford. D. 24 Oct. 1939.

McCARTHY, mą-kar'thi, Justin, Irish author and politician: b. Cork, Ireland, 22 Nov. 1830; d. 24 April 1912. He became connected with the Liverpool press in 1853 and in 1864 was made editor-in-chief of the Morning *Star*. He sat in Parliament as a Home Ruler from 1879–1900 and was chairman of the Irish Parliamentary party 1890–96. His stay in the United States extended from 1868 to 1870, during which period he was some time connected editorially with the New York *Independent*. His main work is 'History of our Own Times' (1879–80), which, rejected by one publishing house, made a fortune for the firm that produced it as well as for the author. He also wrote 'History of the Four Georges' (1889), and his novels include 'Lady Judith' (1871); 'A Fair Saxon' (1873); 'Dear Lady Disdain' (1875); 'The Right Honorable' (1886, with Mrs. Campbell-Praed); 'The Story of Gladstone's Life' (1898); 'Modern England' (1898); 'Reminiscences' (1899); 'The Reign of Queen Anne' (1902), and 'The Story of an Irishman' (1904).

McCARTHY, Justin Huntly, Irish journalist and author: b. 1860. He was graduated at University College and from 1884–92 was a member of Parliament. He was a prolific and versatile author, following in the footsteps of his father, Justin McCarthy (q.v.). Among his works are 'Outline of Irish History' (1883); 'Serapion, and Other Poems' (1883); 'England Under Gladstone' (1884); 'Camiola, a Girl with a Fortune' (1885); 'History of the French Revolution' (1897); 'Short History of the United States'; 'The Dryad' (1905). He also wrote plays, such as 'The Candidate'; 'The White Carnation'; 'If I Were King,' and 'Stand and Deliver.' D. 21 March 1936.

McCAUL, mą-kâl', John, Canadian scholar: b. Dublin, Ireland, 1807; d. 1880. He was appointed president of Toronto University in 1848 and was prominent for many years in educational matters in Canada. He edited Horace, Longinus, Lucian and Thucydides as college textbooks, and among his valuable archæological works are 'Britanno-Roman Inscriptions' (1863), and 'Christian Epitaphs of the First Six Centuries.'

MacCAULEY, mą kâl'ĭ, Clay, American Unitarian clergyman and author: b. Chambersburg, Pa., 8 May 1843. He was graduated at Princeton in 1864 and at the Theological Seminary of the Northwest, Chicago, in 1867, and read philosophy and divinity at Heidelberg, 1873. In the Civil War, 1862–63, he was a lieutenant in the 126th Pennsylvania regiment, and served on the staff of Gen. S. D. Sturgis, and in 1864–65 was a member of the Christian Commission in the United States army. In 1880–81 he was a collaborator of the Bureau of Ethnology among Indians east of the Mississippi. Entering the Unitarian ministry he was pastor of the First Church, Waltham, Mass., 1869–72, and of All Souls Church, Washington, D. C., 1876–81. From 1890 to 1900 and again after 1909 he served as director of the Japan mission of the Unitarian Association, and from 1891 to 1899 was president of the College for Advanced Learning at Tokio and professor there of philosophic and historic theology. He lectured on Japan in 1904–09. He wrote 'Christianity in History' (1891); 'The Religious Problem of Japan—How to Solve It' (1894); 'Introductory Course in Japanese' (1896; 1905); 'Japanese Literature' (1899); 'A Day in the Very Noble City, Manila' (1899); and published 'Single Songs of a Hundred Poets' (1899) and other translations from the Japanese; 'Florida Seminoles' (1884); 'Present Religious Condition of Japan' (1902); 'Unitarian Mission to Japan' (1909); 'A Daughter of the Samurai' (1910); 'Thought and Fact for To-day,' also in Japanese (1911); 'The Memorial Most Worthy of Our Patriot Dead' (1911); 'The English Language in the New Georgean Era' (1911); 'Charles Dickens: An Appreciation' (1912); 'The Faith of the Incarnation' (1913); 'Memories and Memorials' (1914); 'The American-Japanese Problem as a Race Question' (1915), and contributions to periodicals in Japan and the United States. He died 15 Nov. 1925.

McCAUSLAND'S RAID, an incursion of the Confederate general McCausland into Maryland and Pennsylvania, the chief incident of which was the burning of Chambersburg, Pa. General Early having defeated General Crook in the battle of Kernstown (q.v.), 24 July 1864, and driven him and Averell across the Potomac at Williamsport, ordered General McCausland with his brigade and that of Bradley T. Johnson, with four guns, in all about 2,500 men, across the Potomac to raid Pennsylvania and then move to Cumberland, Md., to destroy the machinery of the Cumberland coal-pits and the repair shops, stations and bridges of the Baltimore and Ohio Railroad. Early says he wished to open the eyes of the people of the North to the enormities of its armies, by an example in the way of retaliation, and that Chambersburg, Pa., was selected as the town on which retaliation should be made. The sum of $100,000 in gold, or $500,000 in currency was to be demanded of it, in default of which McCausland was ordered to burn the town. Under cover of demonstrations at Williamsport and other points along the Potomac, McCausland crossed the river at McCoy's Ferry, near Clear Spring, above Williamsport, on the 29th, and made straight for Chambersburg, about 25 miles northeast. He met with but little opposition and, on the morning of the 30th, rode into the fated town and demanded the sum fixed by Early. It could not immediately be raised; he knew that General Averell was close upon him, and setting fire to the place, laying a greater part of it in ashes, he hastily marched westward to McConnellsburg and encamped. Averell, who was in Hagerstown when he heard that McCausland had crossed the Potomac, started in pursuit with about 2,600 cavalry, went through the burning town and, a few miles from McConnellsburg, struck McCausland's rear, diverting him from his intended march on Bedford and forcing him back to the Potomac at Hancock, which was reached by noon of the 31st. Here McCausland formed for battle, but upon Averell's appearance and prompt attack he withdrew westward by the National road to Cumberland, where, 1 August, he found General Kelley to oppose him, whom he attacked in the afternoon, and skirmished until night, when he retreated toward Old Town, on the Potomac, leaving 30 of his killed and wounded on the field. At Old Town he forced a crossing at daylight 2 August, capturing or dispersing a regiment of new troops from Ohio, and then moved south into the valley of the south branch of the Potomac, by way of Springfield and Romney. From Romney, 4 August, he moved on New Creek and attacked the garrison, but after a stubborn fight was repulsed, leaving 25 dead on the field, the Union loss being 36 killed and wounded. McCausland then withdrew to near Moorefield, where the south fork joins the south branch of the Potomac, and considering himself safe from pursuit went into camp. Averell, who had remained at Hancock when McCausland drew off toward Cumberland, crossed the Potomac on the 4th, and, after a forced march through Bath, Springfield and Romney, before sunrise of the 7th surprised McCausland in his camp and routed him, capturing his four guns, nearly all his wagons, several hundred horses, three battle-flags, many small arms and 420 prisoners, including 38 officers. McCausland's loss in killed and wounded was about 100. Averell's loss was 41 killed and wounded. McCausland's shattered command fled to the mountains and made its way in squads to the Shenandoah Valley, finally assembling at Mount Jackson. "This affair," says Early, "had a very damaging effect upon my cavalry for the rest of the campaign." Consult 'Official Records' (Vols. XXXVII, XLIII); Pond, 'The Shenandoah Valley in 1864'; Early, 'The Last Year of the War for Independence.'

MacCHESNEY, mąk-chĕ'nē, **Clara T.,** American artist: b. Brownsville, Cal., 1861; d. 6 Aug. 1928. She studied at the San Francisco Art School, at the Gotham Art School, New York, and at the Colarossi School in Paris. Her genre work received favorable recognition. At the World's Columbian Exposition in 1893 she was awarded two medals and she received the Dodge Prize, New York, in 1894. Later she also received three medals from the Colarossi School, a gold medal from the Philadelphia Art Club and the second Hallgarten prize from the National Academy of Design, New York. At the Paris Exposition of 1900 she exhibited 'Pomegranates' and 'The Old Blind Fiddler.'

MacCHESNEY, Nathan William, American lawyer, publicist and writer: b. Chicago, Ill., 2 June 1878. He studied at Chicago University, and graduated from the Law School of the University of Michigan in 1902. He practiced in Chicago, and was a member of many important legal, civic and political boards and organizations. From 1911–17 he served as Judge Advocate General of Illinois, and during the World War was employed in many important legal capacities. From 1924 he was consul-general for Siam. His writings include: 'The Military Policy of the United States'; 'Principles of Military Law'; 'Principles of Real Estate Law'; 'Challenge to American Ideals.'

MACCHIAVELLI, Niccolo. See MACHIAVELLI, NICCOLO.

McCHORD, mă-kôrd, **Charles Caldwell,** American lawyer: b. Springfield, Ky., 3 Dec. 1859. He was educated at Centre College (now Central University), Danville, Ky., and was admitted to the bar in 1882, engaging in practice at Louisville, Ky. He was a member of the law firm, McChord, Hines and Norman, until 1911. He was prosecuting attorney of Washington County, Ky., in 1886–92, and was chairman of the Kentucky Railroad Commission in 1892–95 and in 1899–1907. He served in the Kentucky senate in 1895–99 and introduced the railroad rate bill enacted by the legislature. He was president of the National Association of Railroad Commissioners in 1906–07, and in 1910–26 was a member of the Interstate Commerce Commission, resigning in 1926 to resume his law practice.

McCLAIN, mą-klān, **Emlin,** American jurist: b. Salem, Ohio, 26 Nov. 1861; d. 25 May 1915. He was graduated at the State University of Iowa in 1871, later studying law there, and until 1881 he practised law in Des Moines. He was appointed professor of law at the University of Iowa in 1881 and was subsequently vice-chancellor and chancellor there. He served as judge of the Supreme Court of Iowa in 1901–12. and was its chief justice in 1906–12.

From 1913 until his death he was professor of law at the Leland Stanford, Jr., University. He was a contributor to the 'American Encyclopedia of Law and Procedure,' wrote extensively for the law magazines and was author of 'McClain's Annotated Statutes of Iowa' (1880); 'A Treatise on Criminal Law as Now Administered in the United States' (1897); 'Constitutional Law in the United States' (1905; 2d ed., 1910), etc.

McCLELLAN, mą-klĕl'ąn, **George Brinton,** American soldier: b. Philadelphia, 3 Dec. 1826; d. Orange, N. J., 29 Oct. 1885. He was educated at the University of Pennsylvania and at West Point where he was graduated in 1846. He was brevetted second lieutenant of engineers and immediately ordered to Mexico, where as lieutenant of a company of sappers, miners and pontoniers he rendered valuable service. He was at the siege of Vera Cruz, at Cerro Gordo and in the attack on the City of Mexico; at Contreras and Churubusco he won the brevet of first lieutenant and was brevetted captain for gallantry at Chapultepec. After the war he was ordered to West Point as captain of field labors and instructor in bayonet exercise. In 1851 he was ordered to Fort Delaware to superintend its construction. The next year he accompanied Capt. Randolph B. Marcy (later his father-in-law) on an expedition to explore the Red River, and in September 1852 was ordered as senior engineer to Texas, to survey the rivers and harbors of that State. In 1853 he was detailed for the examination of the western part of the proposed route for a Pacific railroad; and explored the Yakima Pass and various portions of the Cascade Range, and the most direct route to Puget Sound, his report forming the first volume of the 'Pacific Railroad Surveys' published by the government. He was soon afterward detailed to investigate the railroad system of the United States, with a view to obtain all the necessary data on construction, equipment and management for the successful operation of the Pacific railroad. Of the result of his proceedings he presented a full report in November 1854. In March 1854 he was promoted to captain in the 1st Cavalry. In the spring of 1855 he was sent to Europe to study the organization of European armies and observe the war in the Crimea. He wrote one volume of the report of the commission, which was republished in Philadelphia under the title of 'The Armies of Europe' (1861). He resigned his commission in January 1857, and was for three years vice-president and engineer of the Illinois Central Railroad, at the end of which time he became general superintendent of the Ohio and Mississippi Railroad, and two months later president of the eastern division of the same road. He held this office when the Civil War broke out in 1861. He then received a commission as major-general from the governor of Ohio and proceeded to organize the volunteers of the State; the States of Ohio, Illinois, Indiana, the western part of Pennsylvania and western part of Virginia were united to form the Department of the Ohio under his command. About 1 June his army began to cross the Ohio River into Virginia; on the 18th McClellan himself left Cincinnati to take the field, and by the middle of July the whole northwestern part of the State had been cleared of Confederate troops and the Wheeling legislature left free to organize a loyal government.

On 22 July, McClellan was summoned to Washington to take command of the Army of the Potomac, and commissioned as major-general of the United States army. On his arrival at Washington he found everything in disorder and the troops badly demoralized in consequence of the defeat at the first battle of Bull Run, and devoting himself to the organizing and disciplining of his army, he soon brought order out of chaos and had his troops well equipped and in excellent condition. On the retirement of General Scott from active service, McClellan was appointed general-in-chief of the armies of the United States. Plans were then taken under discussion for an attack upon Richmond, and here difference of opinion arose between the President and the Secretary of War and McClellan; the plan finally accepted made the base of supplies on Chesapeake Bay, with line of march upon Richmond from the Peninsula. The army did not move until March 1862, and in the meantime discontent had arisen at Washington on account of the delay. On 10 March the army advanced toward Manassas, but as the Confederates had evacuated that place and had fallen back upon Richmond, the real campaign was begun by transporting the troops to Fortress Monroe. On 11 March, some two weeks before leaving Washington, McClellan was deprived of the chief command, leaving him the command of only the Army of the Potomac; McDowell's corps and other reinforcements on which he had relied were also removed from his army for the defense of Washington. He besieged Yorktown for a month, though opposed by a much inferior Confederate force, whose numbers he greatly overestimated; when Yorktown was evacuated 4 May, he advanced toward Richmond, defeating the Confederates at Williamsburg and Hanover Court House. After reaching the Chickahominy, he found his lines too extended to protect from attack and advance upon Richmond, and decided to retreat to the James River; then followed the Seven Days' Battles which ended when the Federal forces reached Hampton's Ferry. From here McClellan had planned a new advance, but dissatisfaction against him was so strong that he was relieved of his command and ordered to evacuate the Peninsula. (See PENINSULAR CAMPAIGN). He was then put in command of the fortifications of Washington, till after the second battle of Bull Run, when he succeeded General Pope, again taking command of the Army of the Potomac. On Lee's invasion of Maryland, McClellan marched to attack him and fought the battle of Antietam (q.v.), forcing the Confederates to retreat from their position and following them as far as the Potomac. He did not, however, cross the Potomac in pursuit, as he was awaiting supplies; this failure to follow up his victory caused him to be deprived of his command and he was ordered to Trenton, N. J. He took no further part in the war.

In 1864 he was Democratic nominee for President of the United States, and was defeated, the electoral vote stood 212 for Lincoln against 21 for McClellan, but McClellan's popular vote was 1,800,000. He remained abroad from 1864–68, and on his return had charge of the construction of the Stevens' floating battery,

which, however was not completed on account of financial difficulties. In 1870 he was appointed chief engineer of the department of docks for New York City, in 1877 he was elected governor of New Jersey, and during his administration reduced and finally abolished the state tax, improved the system of public education and built up an effective militia; he declined a renomination. As a general, McClellan won the confidence and aroused the enthusiasm of his soldiers to an unusual degree; he excelled as an organizer of armies and had a thorough knowledge of the science of tactics, as shown in his plans of campaign, but in actual campaigning lacked aggressiveness and the power to act quickly and take advantage of his enemy's mistakes. He wrote besides the reports mentioned 'Manual of Bayonet Exercise' (1852) and 'Report on the Organization and Campaigns of the Army of the Potomac' (1864). Consult 'McClellan's Own Story,' edited by W. C. Preine (New York 1887); Michie, P. S., 'General McClellan' (in 'Great Commander' series ib. 1901); Rhodes, J. F., 'The First Six Weeks of McClellan's Peninsular Campaign' (Boston 1896); Ropes, J. C., 'Story of the Civil War' (Vol. II, New York 1895); Webb, A. S., 'Peninsula: McClellan's Campaign of 1862' (ib. 1881), and Bradford, Gamaliel, 'Union Portraits' (in *Atlantic Monthly* Vol. CXIV, Boston 1914).

McCLELLAN, George Brinton, American publicist and public official: b. Dresden, Germany (where his parents were on a visit), 23 Nov. 1865; d. Washington, D. C., 30 Nov. 1940. He was the son of Gen. George B. McClellan (q.v.), and was graduated from Princeton, A.B. in 1886; A.M. in 1889. Taking up journalism, he was a reporter on the staffs of several New York City dailies, and from 1889–92 was treasurer of the Brooklyn Bridge, then a toll structure. In the meantime, he studied law and was admitted to the bar in 1892. In 1893 Richard Croker, then boss of Tammany Hall, picked the youthful «silk-stocking» as window dressing for his municipal ticket and made him president of the New York City Board of Aldermen. In 1894 he was elected to Congress and served as a member thereof continuously until 1903, when Charles F. Murphy, then the Tammany boss, capitalized the McClellan brains and respectability to defeat Seth Low for a second term as mayor of Greater New York. Two years later Murphy again lined up his forces behind Mr. McClellan as the only means of keeping William Randolph Hearst out of the City Hall. But there was trouble brewing. Mr. McClellan had fought vice and gambling, and otherwise had given offense to Murphy and his following. In January 1906 he committed political suicide by asserting: «As a Democrat and as mayor of this town, I am unalterably opposed to Charles F. Murphy and everything he stands for.» He retired from politics in 1909 at the end of his second term, but he left behind a record for efficiency and honesty that forms one of the few bright pages in New York officialdom of that era. As mayor he initiated many outstanding municipal projects including the Catskill water supply, the Queensboro and Manhattan bridges, and the Municipal Building. Mr. McClellan was made honorary chancellor of Union University in 1906, and was Stafford Little lecturer on public affairs at Princeton, 1908–10: university lecturer on public affairs, 1911–12; professor of economic history at Princeton 1912–31; emeritus thereafter. During the World War he served overseas as lieutenant colonel. He was a member of numerous societies and published 'The Oligarchy of Venice' (1904); 'The Heel of War' (1915); 'Venice and Bonaparte' (1931); 'Modern Italy' (1933); also numerous magazine articles. He received the honorary degree of LL.D. from Princeton and Fordham universities in 1905 and from Union University in 1906. In 1889 he married Miss Georgianna L. Heckscher, daughter of John G. Heckscher and niece of August Heckscher. Mr. McClellan traveled extensively, and after leaving Princeton lived in Washington. His collection of Meissen porcelain is famous.

McCLERNAND, John Alexander, American lawyer: b. Breckinridge County, Ky., 30 May 1812; d. Springfield, Ill., 20 Sept. 1900. He was admitted to the Kentucky bar in 1832, but in the same year volunteered for military service against the Sac and Fox Indians. Five years later he was elected to the Illinois legislature, and subsequently sat for two terms in Congress. During the Civil War he served with distinction at the battle of Fort Donelson, was brigadier general of volunteers, and was promoted major general. He led a division at the battle of Shiloh, relieved Sherman before Vicksburg in 1863 and was in command of the 13th Army Corps until 1864, when he resigned. In 1870 he was appointed circuit judge for the Sangamon, Ill., district. He presided at the National Democratic Convention in Saint Louis, 1876, and was appointed by President Cleveland member of the Utah Commission.

MACCLESFIELD, măk'k'lz-fēld, England, market town and municipal borough in Cheshire, 166 miles northwest of London, on the river Bollin and on the London, Midland and Scottish and the London North Eastern railways. In the Domesday Survey it is recorded as part of the estate of the Earl of Chester and is reputed to have become a free borough in the beginning of the 13th century. The first recorded charter, however, dates from 1261. The church of Saint Michael was founded in 1278 and was partially rebuilt and considerably enlarged in 1740. A commercial school was erected in 1840 from the funds of the free grammar school founded in 1502. There are slate and stone quarries in the vicinity and brewing is carried on; but the chief manufactures of the town are in silk and cotton textiles. The first silk mill was set up in 1755, while the manufacture of cotton was begun in 1785. The town has modern water and gas works, an insane asylum, public library, parks, baths and markets. Pop. about 34,797.

McCLINTOCK, Emory, American actuary: b. Carlisle, Pa., 19 Sept. 1840; d. 10 July 1916. He was graduated from Columbia University in 1859, and afterward took special studies in chemistry. He was tutor in mathematics at Columbia 1859–60. He was consular agent at Bradford, England, 1863–66, actuary of the Asbury Life Insurance Company, New York, 1867–77, and of the Northwestern Mutual Life Insurance Company, Milwaukee, 1871–89. From 1889 to 1911 he was actuary of the Mutual Life Insurance Company, New York, of which he was vice-president in 1905–

1911, trustee after 1905 and consulting actuary after 1911.

McCLINTOCK, mâ-klĭn'tŭk, Sir **Francis Leopold,** English admiral: b. Dundalk, Ireland, 1819; d. Nov. 17, 1907. He entered the British Navy in 1831 and was commissioned lieutenant in 1845. He sailed on four Arctic voyages, being sent out in 1848 to search for Sir John Franklin, and again in 1850 and 1852, without discovering any traces of the explorer. In 1857 he renewed the search as commander of the *Fox* and brought back documentary and other evidence of Franklin's death. For his services as an Arctic explorer he was knighted in 1860, made a vice admiral (1877), and admiral (1884). He wrote *Voyage of the Fox* (1859).

M'CLINTOCK, John, American Methodist Episcopal clergyman and educator: b. Philadelphia, Pa., Oct. 27, 1814; d. Madison, N. Y., March 4, 1870. He was graduated at the University of Pennsylvania in 1835. He entered the ministry of the Methodist Episcopal Church and from 1836 to 1851 was professor of mathematics and classical languages at Dickinson College, Carlisle, Pa. From 1848 to 1856 he edited the *Methodist Quarterly Review.* He was delegate to several conferences abroad and in 1857 became pastor of St. Paul's Church, New York. Three years later he was appointed preacher of the American Chapel in Paris. He advocated the Union cause in the Civil War, and after his return to America in 1864 was again pastor of St. Paul's, New York, but failing health compelled his resignation and he retired. In 1866 he became chairman of the Central Centenary Committee of the Methodist Episcopal Church. For the last three years of his life he was president of the Drew Theological Seminary. He was joint editor and compiler with James Strong of the *Cyclopaedia of Biblical, Theological and Ecclesiastical Literature.* Among his other works are *The Temporal Power of the Pope* (1855); a translation of J. A. W. Neander's *Life of Jesus Christ* (1848); *Sketches of Eminent Methodist Ministers* (1854); a translation of L. F. Bungener's *History of the Council of Trent* (1855); *Living Words,* sermons (1871) and *Lectures . . . on Theological Encyclopaedia and Methodology* (1873).

McCLOSKEY, mâ-klŏs'kĭ, **John,** American Roman Catholic prelate: b. Brooklyn, N. Y., March 10, 1810; d. New York, Oct. 10, 1885. His secondary and collegiate studies were made at Mount St. Mary's College, Emmitsburg, Md., and his postgraduate studies in France and Rome. At 24 he was ordained priest and on returning to America was assigned to St. Joseph's Church, New York City. When St. John's College, at Fordham, was opened in 1841, he was made its first president, but in the next year he returned to parish work. In 1844 he was appointed coadjutor to Bishop John Hughes of the diocese of New York, and consecrated titular bishop of Axiern; and three years later was appointed bishop of Albany, a diocese just created from a part of the diocese of New York. For 17 years he worked for the upbuilding of the Albany diocese and the good of his people. He built the Cathedral of the Immaculate Conception at Albany, St. Joseph's Theological Seminary at Troy, established several new parishes and founded educational and charitable institutions, including hospitals, orphanages, homes for the aged and reformatories. He succeeded Archbishop Hughes in the archiepiscopal see of New York, May 6, 1864. He was made a cardinal in 1875, under the title of Santa Maria supra Minervam. He was in attendance at the Vatican Council (q.v.) and a member of the committee on discipline. He was summoned to Rome in February 1878 to attend the conclave for the election of a pope but was too late to cast a vote, Leo XIII having been elected a few hours before his arrival. Cardinal McCloskey was noted for his gentleness, firmness, profound scholarship and great executive ability.

McCLOY, John Jay, United States government official: b. Philadelphia, Pa., March 31, 1895. After attending Amherst College (A.B. 1916), he went on to Harvard Law School to receive his bachelor of laws degree in 1912 and to be admitted to the New York bar in the same year. He had temporarily interrupted his studies to serve overseas during World War I in the 77th and 160th Field Artillery units and with occupation forces in Germany. From 1921 until the end of 1924 he was associated with the New York City law firm of Cadwalader, Wickersham and Taft, and from 1925 to 1940, with the firm of Cravath, de Gersdorff, Swain and Wood.

In October 1940 he entered the government service under appointment by Secretary of War Henry Stimson as the latter's special consultant. The following April, McCloy was appointed assistant secretary of war, serving until November 1945, in which capacity he attended the San Francisco Conference on International Organization and helped formulate plans for the war crimes trials. Later, in Washington, he assisted in framing policies for the administration of liberated and occupied enemy territories. On Feb. 28, 1947, after a brief return to private law practice, he assumed the presidency of the International Bank for Reconstruction and Development. Subsequently he enunciated as world bank policy the necessity of taking "calculated risks" if the bank were to perform effectively. In mid-1949 McCloy was sent to western Germany as the first civilian United States high commissioner, as chief Economic Cooperation Administration representative, and as the American member of the three-power council exercising Allied authority. In early 1951 he was strongly urging the western German government to accept the Schuman plan for the pooling of western European coal and steel resources.

McCLUNG, mâ-klŭng', **Clarence Erwin,** American zoologist: b. Clayton, Calif., April 5, 1870; d. Swarthmore, Pa., Jan. 17, 1946. He was graduated at the University of Kansas in 1892, later studying at Columbia University and the University of Chicago. A member of the faculty of the School of Medicine at the University of Kansas in 1897–1913, he then became professor of zoology and director of the zoological laboratory at the University of Pennsylvania. He was internationally known for his extensive studies on chromosomes and headed scientific expeditions to Oregon, Washington, and western Kansas. He wrote articles on the Cretaceous fish of Kansas, and was managing editor of the *Journal of Morphology.*

McCLURE, mą'kloor', **Alexander Kelly,** American journalist: b. Sherman's Valley, Perry County, Pa., 9 Jan. 1828; d. 1909. He was reared on a farm, educated at home and apprenticed to a tanner in 1842, soon after began to write for the Perry *Freeman* and edited and published the *Juniata Sentinel* at Mifflin, Pa., in the Whig interest, 1846–50. He then published (1850–56) the Chambersburg *Repository,* which he made influential in the cause of anti-slavery. He was State superintendent of printing in 1855; a member of the State convention of 1855 which met at Pittsburgh to organize the Republican party; in 1856 was admitted to the bar and was a delegate to the first Republican National Convention in Philadelphia. In 1857–58 he sat in the legislature as a Republican and was State senator in 1859. As leader of the Pennsylvania delegation in the Republican National Convention of 1860 he aided in the nomination of Abraham Lincoln. In 1862–64 he again published the Chambersburg *Repository,* and in the latter year served as assistant adjutant-general in charge of the draft in Pennsylvania. Two years later he was again a member of the legislature, and in 1868–73 practised law in Philadelphia. He was chairman of the State delegation to the Liberal Republican Convention in 1872, and of the Liberal Republican State Committee, and in that year entered the State senate. In a close election in 1873 he was defeated as an independent candidate for mayor of Philadelphia. In 1875 he established the Philadelphia *Times,* of which he was editor-in-chief till 1901. He published 'Three Thousand Miles Through the Rocky Mountains'; 'Our Presidents and How We Make Them' (1901); 'Recollections of Half a Century' (1902); 'Old Time Notes of Pennsylvania' (2 vols., 1906), etc.

McCLURE, James Gore King, American Presbyterian clergyman: b. Albany, N. Y., 24 Nov. 1848. He was graduated at Yale in 1870, at the Princeton Theological Seminary in 1873 and ordained as a Presbyterian minister in 1874. He was settled (1874–79) at New Scotland, N. Y., and at Lake Forest, Ill., 1881–1905. From 1897 to 1901 he was president of Lake Forest University. In 1905–28 he was president of McCormick (now Presbyterian) Theological Seminary, Chicago. He has written 'The Man Who Wanted to Help' (1897); 'The Great Appeal' (1898); 'Environment' (1899); 'For Hearts that Hope' (1900); 'A Mighty Means of Usefulness' (1901); 'Living for the Best' (1903); 'The Growing Pastor' (1904); 'Loyalty, the Soul of Religion' (1905); 'Supreme Things' (1907), etc.

McCLURE, Sir Robert John Le Mesurier, English vice-admiral: b. Wexford, Ireland, 28 Jan. 1807; d. London, 17 Oct. 1873. He began his naval career in 1824, and in 1836 under Sir John Ross made his first voyage to the Arctic regions. Again he joined an expedition sent to discover the Northwest Passage in 1848, that of Sir James Clark Ross. Two years later he was placed in command of a Franklin search expedition, discovered Prince of Wales Strait which connects the Atlantic and Pacific and thus accomplished one object of the expedition, the discovery of the Northwest Passage. He was forced, however, to abandon his ship, and completed the Northwest Passage by land. On his return he was knighted. From his journals was published 'The Discovery of the Northwest Passage' (by Capt. Sherard Osborne, 1856).

McCLURE, Samuel Sidney, American editor and publisher: b. Frocess, County Antrim, Ireland, 17 Feb. 1857. He was graduated at Knox College, Galesburg, Ill., in 1882. In 1882–83 he was editor and manager of the *Wheelman* for the Pope Manufacturing Company, and in the following year was connected with the De Vinne Press, New York. In 1884 he established a newspaper syndicate which has grown to great proportions and assumed distinctive importance in the publishing world. In 1893 he founded *McClure's Magazine,* which through his able administration soon stood in the front rank of American periodicals. In 1899 he established the publishing house of McClure, Phillips and Company, New York, and was its president until the business was acquired by Doubleday, Page and Company. The magazine was taken over by the McClure Publications, Incorporated. Since 1893 Mr. McClure has been president of the S. S. McClure Company and since 1894 he has been a trustee of Knox College. Consult Mr. McClure's very interesting 'My Autobiography' (New York 1914).

McCLURG, mą-kloorg', **Alexander Caldwell,** American publisher: b. Philadelphia, 1834; d. Saint Augustine, Fla., 15 April 1901. He was graduated at Miami University, Oxford, Ohio, in 1853, engaged in business with S. C. Griggs and Company, publishers, in Chicago and in 1862 entered the Union army. He was captain in the 88th Illinois regiment of infantry, rose to the rank of colonel, was made brevet brigadier-general, and in the Atlanta campaign and during Sherman's great march served as chief of staff to the 14th corps. Returning from the war, he was admitted to partnership in the publishing house above mentioned, and some years later established the firm of Jansen, McClurg and Company, afterward A. C. McClurg and Company. The business of the house prospered, and in 1899 the company was reorganized, the co-operative principle adopted and the employees, among whom the stock was largely distributed, were granted easy terms for increasing their investments.

McCLYMONT, măk-klī'mŏnt, **James Alexander,** Scottish theologian: b. Girvan, Ayrshire, 26 May 1848. He was educated at the universities of Edinburgh and Tübingen, entered the ministry and in 1874–1913 he was in charge of Holburn Church, Aberdeen, when he retired. He was a member of the general committee of the Church of Scotland, and was a chaplain in the territorial force, retired with the rank of colonel. He collaborated in translating Beck's 'Pastoral Theology of the New Testament' and was author of 'The New Testament and its Writers' (1892; 2d ed., 1893); 'The Church of Scotland' (1893); 'New Testament Criticism' (1913), etc. He died 19 Sept. 1927.

MacCOLL, mą-kŏl', **Evan,** Canadian poet: b. Kenmore, Argyleshire, Scotland, 21 Sept. 1808; d. Toronto, 1898. He emigrated to Canada in his 42d year and became known as the poet of the Scottish colony at Kingston. He wrote with fluency in Gaelic and his 'Clàreach nam Beann' created much enthusiasm among

his compatriots. He is also author of many English poems, such as *My Rowan Tree; The Mountain Minstrel* (1887).

McCOLLUM, mă-kŏl′ŭm, **Elmer Verner,** American physiological chemist: b. near Fort Scott, Kansas, March 3, 1879. Graduating from the University of Kansas and Yale University, he taught at the University of Wisconsin from 1907 to 1917, afterwards accepting a professorship in biochemistry at the School of Hygiene and Public Health, Johns Hopkins University, a position he held until 1944 when he was made professor emeritus.

McCollum has specialized in the study of vitamins and the relation of diet to growth. Among his important discoveries were the "fat-soluble" vitamin A in 1913, later, vitamin B in milk sugar, and in 1922 the importance of vitamin D in the treatment of rickets. He was a member of the International Committee on Vitamin Standards, League of Nations, 1931; after 1939 the chairman of the Nutrition section, Pan-American Sanitary Bureau; and after 1942 a member of the Food and Nutrition Board, National Research Council. In 1943 the United States Army called him as a consultant to its Industrial Hygiene Division. McCollum has written extensively in the fields of chemistry and nutrition.

McCOMB, mă-kōm′, **John,** American engineer and architect: b. New York, Oct. 17, 1763; d. there, May 25, 1853. He became prominent for his designs for both public and private buildings in New York, Philadelphia and the Eastern States. He designed the front of the old government house in New York in 1790, Saint John's Church, and was supervising architect of the city of New York at the time of the erection of the city hall. The Montauk (1795), Eaton's Neck (1798), and Cape Henry (1791) lighthouses were also his designs.

McCOMB, city, Mississippi, in Pike County, 60 miles east-southeast of Natchez on U.S. Highway 51 and the Illinois Central Railroad. Located in a timber and agricultural region producing cotton, vegetables, and dairy products, McComb is a trading and shipping center, with lumber mills and railroad shops. Manufactures include cotton textiles, clothing, and cottonseed products. It was founded about 1857 by Col. H. S. McComb, the president of the New Orleans, Jackson, and Northern Railroad, which was built in that year. After the establishment of railroad shops here, McComb grew rapidly and soon became important for its textile industries. The city has a mayor-council form of government. Pop. (1950) 10,401.

MacCONMIDHE, mă-kŏn′mĭ-dē, **Giolla-Brighde** or **Gillabrighde,** Irish historian and poet: b. about 1180; d. around 1260. He was descended from the hereditary poets of the O'Neills, and it is recorded that Brian O'Neill, chief of the Cinel Eoghain, on one occasion paid him 20 horned cows for a poem and on another, 20 cows besides gold and clothing. He traveled in many parts of the country, and at the Battle of Down in 1260, he was with O'Neill when that chief was killed by the Lord Justice Stephen Longespée. His 280-word lament on the defeat and death of Brian is his greatest work. He also wrote religious verse and a poem on King Cathal Croibhdhearg O'Conor (d. 1224). See also GAELIC LITERATURE—*Bardic Poetry.*

McCONNELL, mă-kŏn″l, **Francis John,** American Methodist Episcopal bishop: b. Trinway, Ohio, Aug. 18, 1871. He was educated at the Ohio Wesleyan University and entered the ministry in 1894. He held pastorates in Massachusetts and in 1909 became president of De Pauw University, a post in which he served until 1912 when he was elected bishop. He is the author of several books on religious subjects.

McCONNELLSVILLE, mă-kŏn″lz-vĭl, town, Ohio, seat of Morgan County, 27 miles southeast of Zanesville on the navigable Muskingum River. Altitude 710 feet. It is served by state highways and the Baltimore and Ohio Railroad at Malta, across the river. Located in a farming region, it has a few industries, including the manufacture of meat products, lumber, and cigars. There are also gas and oil wells in the vicinity. It was laid out in 1817 by Gen. Robert McConnell. After 1827 keel boats traded between McConnellsville, Zanesville, and Pittsburgh and by 1850 there was a flourishing river trade connecting with Mississippi ports. With the development of overland travel, however, river traffic declined. Pop. (1950) 1,941.

McCOOK, mă-kŏŏk′, **Alexander McDowell,** American soldier: b. Columbiana County, Ohio, April 22, 1831; d. Dayton, Ohio, June 12, 1903. He was graduated at West Point in 1853, and with the commission of second lieutenant of the 3d Infantry was ordered to New Mexico. In 1861 he gained his captaincy and saw much service during the Civil War. He commanded the Ohio volunteers at Bull Run and rapidly gained promotion, being appointed major general of volunteers in 1862.

McCook's brilliant military reputation was made at the battles of Shiloh, Murfreesboro, Chickamauga, and others, and in 1865 he was brevetted brigadier general in the regular army. He was subsequently placed in command of the military school at Fort Leavenworth, was commissioned major general in 1894 and retired the following year. He represented the United States at the coronation of the czar in 1896 and in 1898–1899 was a member of a commission appointed by President McKinley to investigate the work of the War Department during the War with Spain.

General McCook came of a fighting family. He was the son of Daniel McCook who was killed by Morgan's guerillas in 1863. Seven of the general's brothers took part in the War for the Union, three of whom, like their father, were killed. Four of the eight McCook brothers attained the rank of general.

McCOOK, Anson George, American soldier and politician: b. Steubenville, Ohio, Oct. 10, 1835; d. New York, Dec. 30, 1917. At the outbreak of the Civil War he entered the Federal army as captain of an Ohio company recruited by himself, became colonel of 194th Ohio Infantry and at end of the war was brevetted brigadier general. He was United States assessor of internal revenue at Steubenville, Ohio, and removed to New York in 1873. In 1876 he was elected as a Republican to the

House of Representatives from the 8th Congressional District, New York, and was re-elected in 1878 and 1880. From 1884 to 1893 he served as secretary of the United States Senate, and from 1895 to 1898 as chamberlain of New York City.

His brother, EDWARD MOODY MCCOOK (b. Steubenville, Ohio, June 15, 1833; d. Chicago, Ill., Sept. 9, 1909), was also an army officer. He went to Colorado in 1849, practiced law, and in 1859 served as a member of the legislature of Kansas Territory. At the outbreak of the Civil War he joined the Kansas Legion in Washington and then became a cavalry officer. He fought with distinction in the campaigns of 1862 and 1863 and rose to rank of lieutenant colonel. In 1864 he was appointed brigadier general of volunteers and commanded the cavalry of the Army of the Cumberland. In the following year he was breveted brigadier general of the United States Army and major general of volunteers, and served briefly as military governor of Florida. He resigned his commission in 1866 and was appointed United States minister to Hawaii, where he remained until 1869, when he became governor of the Territory of Colorado, serving except for a short period (1873–1874) until 1875.

A second brother, HENRY CHRISTOPHER MCCOOK (b. New Lisbon, Ohio, July 3, 1837; d. Oct. 31, 1911), was a clergyman and naturalist. He was graduated from Jefferson (now Washington and Jefferson) College in 1859, studied at Western Theological Seminary (1860–1863), and was ordained a minister of the Presbyterian Church in 1861. He served as first lieutenant and then as chaplain in the 41st Illinois Volunteers in 1861–1862. In 1863–1864 he was pastor of a church in Clinton, Ill., and from 1864 to 1869 did home mission work in St. Louis. From 1870 to 1902 he was pastor of the Tabernacle Presbyterian Church in Philadelphia. He began to study spiders in 1873, and he wrote a number of papers on spiders and ants. He served as vice president of the Academy of Natural Sciences and as president of the American Entomological Society and the American Presbyterian Historical Association. His published works include "Mound-Making Ants of the Alleghanies, Their Architecture and Habits," *Transactions of the American Entomological Society,* November 1877; *The Natural History of the Agricultural Ant of Texas* (1879); *The Honey Ants of the Garden of the Gods and the Occident Ants of the American Plains* (1882); *Tenants of an Old Farm: Leaves from the Note Book of a Naturalist* (1885); *American Spiders and Their Spinning Work* (3 vols., 1889–1893); and *Ant Communities and How They are Governed, a Study in Natural Civics* (1909).

A third brother, JOHN JAMES MCCOOK (b. New Lisbon, Ohio, Feb. 2, 1843; d. Hartford, Conn., Jan. 9, 1927), was a clergyman and educator. He attended Jefferson (now Washington and Jefferson) College from 1858 to 1860, studied law, and then served in West Virginia in the early part of the Civil War. He was graduated from Trinity College in 1863 and from Berkeley Divinity School in 1866, and in the following year was ordained a priest of the Protestant Episcopal Church. From 1868 until his death he served as rector of St. John's Church, East Hartford, Conn. In 1883 he became instructor of Latin at Trinity College, and in 1886 professor of modern languages there, a position he retained until 1923. He was interested in welfare work and prison reform, and in 1895 was named chairmen of the first commission of the Connecticut Reformatory.

McCOOK, city, Nebraska, seat of Red Willow County, situated at an altitude of 2,510 feet, on the Republican River, 65 miles south of North Platte. It is served by the Chicago, Burlington & Quincy Railroad and by Mid West Airlines. The city is the trading center of a rich agricultural region and serves as a railroad division point. The railroad repair shops are the chief industrial enterprise, but the packing and shipping of food products are also important in the city's economy. McCook was the home of George W. Norris (q.v.). It is the seat of McCook Junior College and has a public library, a municipal auditorium, and two municipal airports. Founded as Fairview in 1881, the city was renamed in the following year for Gen. Alexander McDowell McCook (q.v.). It was incorporated as a town in 1883, and as a city in 1933. Government is of the city manager type. Pop. (1950) 7,768.

McCORMACK, John, Irish American tenor: b. Athlone, Ireland, June 14, 1884; d. Booterstown, County Dublin, Sept. 16, 1945. He was educated at Summer Hill College, County Sligo, and in 1902 won the gold medal for singing at the National Irish Festival. In the following year he became a member of the choir of Dublin Cathedral and studied with its organist, Vincent O'Brien, and later in Milan. He made his operatic debut at Covent Garden, London, on Oct. 15, 1907, as Turiddu in *Cavalleria Rusticana.* He sang in Naples in 1909, and on November 10 of that year made his New York debut with the Manhattan Opera Company in *La Traviata.* Subsequently he sang with the Metropolitan, Chicago Grand, and Monte Carlo opera companies. His best roles were Rodolpho in *La Bohème, Faust,* Pinkerton in *Madame Butterfly,* and Don Ottavio in *Don Giovanni.* In 1913 he turned to the concert stage, where he achieved great popularity, especially for his singing of Irish songs. In 1919 he became a United States citizen. He was made a papal count in 1928. His retirement was marked by a farewell tour in 1938.

McCORMICK, Cyrus Hall, American inventor and manufacturer: b. Rockbridge County, Va., Feb. 15, 1809; d. Chicago, Ill., May 13, 1884. In 1831 he invented a successful reaping machine. He patented it in 1834 and later improved the basic design. He moved to Cincinnati in 1845, and two years later to Chicago, where he began to manufacture the machine on a large scale. McCormick successfully fought patent infringements, and his pioneer work in the use of modern business methods helped to bring him great wealth. In 1879 he formed the McCormick Harvesting Machine Company and served as its president until 1884, when he was succeeded by his son and namesake, who, in 1902, became first president of the International Harvester Company.

McCORMICK, Joseph Medill, American journalist and legislator: b. Chicago, Ill., May 16, 1877; d. Washington, D.C., Feb. 25, 1925. The son of Robert Sanderson McCormick and the grandson of Joseph Medill (qq.v.), he was graduated from Yale University in 1900 and joined the staff of the Chicago *Daily Tribune,* whose publisher he later became. He supported Theodore Roosevelt's candidacy for the presidency at the

Convention of 1912. He was vice-chairman of the Progressive National Committee, 1912–14. He was twice elected to the General Assembly of Illinois, and in 1916 was elected to the National House of Representatives. He was elected to the United States Senate in 1918, but was defeated for renomination in 1924. He died at Washington, D. C., 25 Feb. 1925.

McCORMICK, Leander James, American inventor: b. in Virginia, 1819; d. Chicago, 20 Feb. 1900. In early life he worked with his father in manufacturing reaping-machines; removed to Chicago in 1848, and entered into partnership with his brother, Cyrus Hall McCormick (q.v.), and superintended the manufacturing department of their reaping-machine plant until 1879, when the firm was incorporated as the McCormick Harvesting-Machine Company. Ten years later he retired from active business. Many of the improvements in the famous McCormick reaping-machine were made by him. In 1871 he gave an observatory with a powerful telescope to the University of Virginia.

McCORMICK, Robert Sanderson, American diplomat, father of Joseph Medill McCormick and Robert Rutherford McCormick: b. Rockbridge County, Va., 26 July 1849; d. Chicago, 16 April 1919. He was educated at the University of Virginia and entered the diplomatic service as secretary of the American legation at London in 1889–92. He was appointed first Ambassador to Austria-Hungary in July 1902; was Ambassador to Russia from December 1902 to 1905; and Ambassador to France in 1905–07. He was decorated with the Order of the Rising Sun, Japan, 1907. During the Russo-Japanese War Mr. McCormick represented the interests of Japan in Russia.

McCORMICK OBSERVATORY. See LEANDER McCORMICK OBSERVATORY.

McCORMICK THEOLOGICAL SEMINARY, in Chicago, Ill.; opened in 1830 under the auspices of the Presbyterians, as a department of Hanover Academy, at Hanover, Ind. Ten years after its opening the school was removed to New Albany, Ind. Cyrus H. McCormick (q.v.) offered the institution a liberal endowment, which generous gift caused the removal of the school to Chicago, in 1859. It was at first known as the Presbyterian Theological Seminary of the Northwest. In 1886 it was named in honor of its liberal benefactor. It is now called the Presbyterian Theological Seminary. No fees are charged, and some of its income is used in assisting needy students. Recently there were connected with the seminary 15 professors and instructors and 174 students. The library contained about 55,000 volumes. The total income on productive funds and from other sources, but excluding benefactions, was about $125,000. Its buildings and grounds were valued at nearly $1,450,000 and its endowment funds at about $112,375,000.

McCOSH, mą-kŏsh′, **James,** Scotch-American author and educator: b. Carskeoch, Ayrshire, 1 April 1811; d. Princeton, N. J., 16 Nov. 1894. He was educated at the University of Glasgow, which he entered at 13, and at the University of Edinburgh, where he went in 1829. He became a minister of the Church of Scotland; was settled at Arbroath in 1835, and at Brechin in 1839; but at the disruption of the Scottish Church joined the Free Church, whose organization he was active in promoting. In 1850 he published 'The Method of the Divine Government, Physical and Moral,' in which he applied the philosophy of Sir William Hamilton to questions of theology with such skill as to elicit from him the highest commendation. This work at once gave McCosh wide fame as a philosophical thinker, and in 1851 he was appointed professor of logic and metaphysics in Queen's College, Belfast, where he remained 18 years, not only discharging his professional duties, but also entering earnestly into work of religious and social improvement, through which his spirit of benevolence and his enlightened zeal for general education accomplished lasting results. In 1868 he was elected president of the College of New Jersey (now Princeton University), having previously visited this country and become impressed with its educational promise. This promise was especially bright when he assumed the presidency of Princeton, but the conditions of transition in the sphere of higher education were such as to demand consummate powers of leadership. Such powers McCosh, although a foreigner, brought to his work with most satisfying success. During the 20 years of his administration at Princeton he saw the number of students and professors more than doubled and prosperity increased in all departments. His resignation in 1888 was due to the advance of years, and he was able to continue in the chair of philosophy beyond that period. As a philosopher he maintained the principles of the Scottish metaphysicians against all empirical methods, but went beyond his predecessors in the direction of intuitionalism, although he once declared that this "rose out of rationalism as frogs rise out of the melted ice," and few orthodox theologians were abreast of him in welcoming the evolutionary features of the new biology. His writings on theology, philosophy and psychology are very numerous and include 'Typical Forms and Special Ends in Creation,' in collaboration with Dickie (1856); 'The Intuitions of the Mind Inductively Investigated' (1860); 'The Supernatural in Relation to the Natural' (1862); 'An Examination of Mill's Philosophy' (1866); 'Laws of Discursive Thought' (1869); 'Christianity and Positivism' (1871); 'The Scottish Philosophy, Biographical and Critical' (1874); 'The Development of Hypothesis' (1876); 'The Emotions' (1880); 'Psychology of the Cognitive Powers' (1886); 'Psychology of the Motive Powers' (1887); 'Realistic Philosophy Defended' (1877), and 'Our Moral Nature' (1892). Consult Dulles, J. H., 'A McCosh Bibliography' (Princeton 1895), and Sloane, W. M., 'The Life of James McCosh' (New York 1896).

McCOY, Isaac, American missionary and Indian agent: b. near Uniontown, Pa., 13 June 1784; d. Louisville, Ky., 21 June 1846. His early life was spent in Kentucky. Reared on the frontier, his educational advantages were very limited, but he was of a studious disposition. He was married at the age of 20 and was ordained to the ministry of the Baptist Church at 24, settling in Indiana about the same time. After serving eight years as pastor of a church, he entered the mission field among the Miami

Indians, in the valley of the Wabash River, in 1817. He subsequently labored among the people of the Pottawatomie and Ottawa tribes in Michigan. During the course of his work among the Indians he became impressed with expediency of removing the Indians from the contaminating influences of the white settlements. In June 1824 he submitted the matter to the consideration of the Baptist Mission Board at Washington, D. C., and was authorized to present the matter to the attention of the President of the United States. He failed to secure an audience with President Monroe, but he was successful in interviewing the Secretary of War, John C. Calhoun, under the jurisdiction of whose department was included all matters pertaining to the administration of Indian affairs. Secretary Calhoun approved of the scheme thus proposed for the establishment of an Indian Territory west of the Mississippi and became its champion. Although several tribes had removed to the West prior to that time, the government had no settled policy in regard to the matter until after Secretary Calhoun took it up officially after the suggestion was made by Mr. McCoy. In 1827 he again visited Washington, where he interviewed President John Quincy Adams and Secretary Barbour of the War Department. In 1828, Mr. McCoy and Capt. George Kennerly of Saint Louis were appointed by the Secretary of War as commissioners to conduct delegations representing the Choctaw, Creek, Pottawatomie and Ottawa tribes on an inspection of the region to be included in the proposed Indian Territory, in the performance of which duty they made two tours of the wilderness region west of Missouri and Arkansas during the late summer and autumn of 1828. During the ensuing 10 years Mr. McCoy was almost constantly in the Indian Territory (i.e., the present States of Kansas, Nebraska and Oklahoma), selecting and surveying locations for immigrant Indian tribes for the government, and, at the same time, aiding in the location and establishment of missions and schools among them. He published a brief annual pamphlet entitled *The Annual Register of Indian Affairs within the Indian (or Western) Territory,* during the years 1835 to 1838 inclusive. Previous to that he had published a pamphlet, 'The Practicability of Indian Reform.' He was also the author of 'A History of Baptist Indian Missions.' His last years were spent at Louisville, Ky., where he had charge of the work of the American Indian Mission Association.

McCOY, Joseph G., American pioneer in the overland cattle trade: b. Springfield, Ill., 20 Dec. 1837; d. Kansas City, Mo., 19 Oct. 1915. Reared on a farm, he made a specialty of feeding cattle for the beef market. At the conclusion of the Civil War the scarcity and high price of beef and the seeming impossibility of transporting the cheap cattle from the overstocked ranges of Texas to the Northern markets, because of the introduction of splenitic fever which was certain to follow among native herds, appealed to the typically American genius of McCoy for achieving that which had been reputed to be impossible. He finally proposed the establishment of a shipping point on one of the new railways, which were then being built westward across the great plains, to which the beef stock of Texas might be slowly driven northward during the grazing season, keeping well to the westward of the frontier settlements, and shipped thence by rail to the market at Chicago for immediate slaughter. This proposal, though simple, was so novel that railway managers at first refused to consider it seriously. McCoy finally induced one of the railway companies to back him in the enterprise and he arranged to build shipping pens at Abiliene, Kan. As the result of a diligent advertising campaign a few Texas ranchmen were persuaded to undertake to drive herds across the Indian Territory to the designated shipping point on the Kansas Pacific Railway, during the season of 1867. Thirty-five thousand head of beef cattle were thus marketed that season. The next year the number thus driven overland to the shipping point was increased to 75,000 head; in 1869, this number was doubled, and in 1870 the number was doubled again. When the overland cattle trade was well established the railway company soon ceased to pay the stipulated royalties to McCoy, but he continued his active interest in the live-stock business until old age forced his retirement. He published 'Historic Sketches of the Cattle Trade in the West and Southwest' (1874). He was a pioneer settler at El Reno, Okla., in 1889, and was nominated as the candidate for Territorial delegate to Congress by the convention of the Democratic party in 1890.

McCRACKAN, ma-krăk'an, William Denison, American author and lecturer: b. Munich, Germany, 12 Feb. 1864; d. New York City, 12 June 1923. He received his earliest education at the Latin Gymnasium, Stuttgart, Germany, Saint Paul's School, Concord, N. H., and was afterward graduated at Trinity College, Hartford, Conn., in 1885. He wrote 'The Rise of the Swiss Republic' (1892); 'Romance and Teutonic Switzerland' (1894); 'Swiss Solutions of American Problems'; 'Little Idyls of the Big World' (1895); 'The Huntington Letters' (1897); 'Fair Land Tyrol' (1905); 'The Italian Lakes' (1907); 'Christian Science: Its Discovery and Development' (1912). From 1901–04 he was a member of the Christian Science Committee on Publication.

MacCRACKEN, Henry Mitchell, American Presbyterian clergyman and educator: b. Oxford, Ohio, 28 Sept. 1840; d. Orlando, Fla., 24 Dec. 1918. He was graduated at Miami University in 1857; for four years was a teacher and school superintendent; studied at the United Presbyterian Theological Seminary, Xenia, Ohio, and at the Princeton Theological Seminary, and later at Tübingen and Berlin universities. He was minister of the Westminster Church, Columbus, Ohio, 1863–67, and of the First Presbyterian Church at Toledo, Ohio, 1869–81. In 1867 he was deputy to the General Assembly of the Free Church of Scotland, and to that of the Presbyterian Church of Ireland in 1884. From 1880 to 1884 he was chancellor of the Western University, Pittsburgh, Pa., and in the latter year became vice-chancellor and professor of philosophy in the University of the City of New York, of which he was made chancellor in 1891. Since then the name of the institution has been changed to New York University, and the seat of the University College and School of Applied Science has been re-

moved to University Heights, New York City. Under his administration the Hall of Fame for Great Americans (q.v.) was added to the university, its growth and prosperity greatly increased and the extension of its work and influence has given it a leading position in the field of American education. During Dr. MacCracken's active connection with the institution it grew from a college with 91 students to a university with 4,113 students, and the property increased in value from $547,000 to $5,211,000. He resigned the chancellorship 28 Sept. 1910. Besides numerous papers on subjects of education, religion and philosophy, he published 'Tercentenary of Presbyterianism' (1870); 'Popular Sermons' (1875); 'Leaders of the Church Universal' (1879); 'John Calvin' (1888); 'Cities and Universities' (1882); 'The Scotch-Irish in America' (1884); 'A Metropolitan University' (1892); 'Educational Progress in the United States' (1893); 'Lives of Church Leaders: or Heroes of the Cross' (1900); 'The Three Essentials' (1901); 'The Hall of Fame' (1901); 'Urgent Eastern Questions' (1912).

MacCRACKEN, Henry Noble, American educator: b. Toledo, Ohio, 19 Nov. 1880. He is the son of Henry Mitchell MacCracken (q.v.) and was educated at New York and Harvard universities. He was instructor in English at the Syrian Protestant College in 1900–03; Harvard Fellow in 1907–08; instructor and afterward assistant professor of English at the Sheffield Scientific School at Yale in 1908–13. He was professor of English at Smith College in 1913–15, and in 1915 became president of Vassar College. In 1917–18 he was national director of the junior membership in the American Red Cross. He has written for the magazines on philology; has edited 'The Serpent of Division' (1910); 'The College Chaucer' (1913); 'Shakespeare's Principal Plays' (1914), etc. He is author of 'First Year English' (1902); and part author of 'English Composition in Theory and Practice' (1909).

MacCRACKEN, John Henry, American educator: b. Rochester, Vt., 30 Sept. 1875. He is the son of Henry Mitchell MacCracken (q.v.), and was educated at the New York University, the Union Theological Seminary and the University of Halle. He was associated with New York University as Fellow, instructor and assistant professor of philosophy in 1894–99; was president of Westminster College, Missouri, in 1899–1903; syndic and professor of politics at New York University in 1903–15; and in 1915–26 was president of Lafayette College, Easton, Pa.

McCRADY, mą-krā'dĭ, **Edward,** American soldier and historian: b. Charleston, S. C., 8 April 1833; d. there, 2 Nov. 1903. He was graduated at Charleston College, admitted to the bar in 1855, and joined earnestly in the movement which led to the secession of his State. He took part in the capture of Castle Pinckney, 27 Dec. 1860, and was present at the bombardment of Fort Sumter in the following April. As captain of the first military company raised in South Carolina for the whole war, he entered the Confederate army, 27 June 1861, was made major and then lieutenant-colonel, was badly wounded at the second battle of Bull Run (or Manassas), 30 Aug. 1862, and in January 1863 received an injury in camp from a falling tree, in consequence of which he was transferred from field service to the command of a camp of instruction at Madison, Fla., in 1864. He remained at that post until the end of the war. Later he became major-general of State troops and a member of the South Carolina legislature (1880–90), where he proposed the South Carolina Election and Registration Law. Among his more important writings may be mentioned 'The History of South Carolina Under the Proprietary Government, 1670–1719' (1897); 'The History of South Carolina Under the Royal Government, 1719–1776' (1899); 'The History of South Carolina in the Revolution, 1775–1780' (1901); and 'The History of South Carolina in the Revolution, 1780–83' (1902).

McCRAE, John David, Canadian physician, soldier and poet: b. Guelph, Ontario, 30 Nov. 1872; d. of pneumonia in France, 28 Jan. 1918. The second son of Lieut.-Col. David McCrae (who organized and took over a battery to France), he was educated at the University of Toronto and took his M.D. degree in 1910. He became Governor's Fellow in Pathology at McGill University; afterwards lecturer in pathology and in medicine. After attaining the M.R.C.P. he was appointed assistant physician to the Royal Victoria Hospital, Montreal, and physician to the Alexandra Hospital. With Professor Adami he was co-author of a textbook on pathology and also contributed to the 'System of Medicine' by Osler and McCrae, the latter being his elder brother (see McCRAE, THOMAS). He served as a lieutenant of artillery in the South African War, taking part in several important engagements. At the outbreak of the European War he volunteered for service and crossed the sea in September 1914 with the Canadian Field Artillery. He served in the field till after the second battle of Ypres, when he was placed in charge of medicine and second in command of the hospital unit provided by McGill University. Shortly before his death he had been appointed consultant to the British Armies in the Field, but had not yet entered upon that post. McCrae attained the rank of lieutenant-colonel; besides achieving high military, professional and academic distinction, he had earned a creditable reputation as a poet. He did not write much, yet his verses have obtained a permanent place in modern anthologies. One of his best-known works is the now famous lyric, 'In Flanders' Fields,' written during the battle of Ypres and originally contributed to *Punch*. The style is peculiarly his own:

> In Flanders' Fields the poppies blow
> Between the crosses, row on row,
> That mark our place, and in the sky
> The larks still bravely singing fly,
> Scarce heard amidst the guns below.
> We are the dead. Short days ago
> We lived, felt dawn, saw sunset glow,
> Loved and were loved; and now we lie
> In Flanders' Fields.
>
> Take up our quarrel with the foe,
> To you from failing hands we throw
> The Torch — be yours to hold it high;
> If you break faith with us who die,
> We shall not sleep, though poppies grow
> In Flanders' Fields.

McCRAE, Thomas, American physician: b. Guelph, Ontario, Canada, 16 Dec. 1870. He was educated at the universities of Toronto and Göttingen, and in 1904–12 was associate in medicine at Johns Hopkins Hospital, serving as associate professor of medicine of the university in 1906–12. He was professor of medicine at Jefferson Medical College, Philadelphia, and physician to the Jefferson and Pennsylvania hospitals from 1912. He was associate editor of Osler's 'System of Medicine'; was co-author, with Sir William Osler, of 'Cancer of the Stomach' (1900); and assistant author of Osler's 'Practice of Medicine' (1912; new ed., 1918). Died 30 June 1935.

McCRARY, George Washington, American justice and legislator: b. Evansville, Ind., 29 Aug. 1835; d. Saint Joseph, Mo., 23 June 1890. He went with his family to the Wisconsin Territory, now a part of Iowa, when a year old, studied law in Keokuk, Iowa, and was admitted to the bar in 1856. He was elected to the State legislature in 1857, and in 1861–65 served in the State senate where he was chairman of the committees on military affairs and the judiciary. He was a member of Congress from 1869–77, and was appointed to the committees on naval affairs, revision of laws, elections, railways and canals, and the judiciary. He proposed the formation of a joint committee for the purpose of determining the electoral vote in the Hayes-Tilden Presidential election, and was connected with the preparation and passing of the Electoral Bill. He was Secretary of War under President Hayes in 1877–79, when he was appointed justice of the United States Circuit Court. He resigned in 1884 and removed to Kansas City, Mo., where he acted as general consulting attorney for the Atchison, Topeka and Santa Fé Railroad until his death. He is author of 'American Law of Elections' (1875).

McCREA, Dorothy Frances, Australian poet and story writer. See McCrea, George Gordon.

McCREA, George Gordon, Australian poet: b. Anchorfield, near Edinburgh, Scotland, 29 May 1833. His father went to Australia in 1841 as warden of the Gold Fields of Australia, taking his family with him. Young McCrea was educated privately and entered the Audit Office in 1854. After serving in the office of the chief secretary and the registrar-general, he became senior examiner of patents and deputy registrar-general. He was retired on a pension after 40 years' service. Among his published works are 'Balladeadro and Mamba' (1866–67); 'Karakorok'; 'The Man in the Iron Mask' (1873); 'A Rosebud from the Garden of Taj,' 'Afloat and Ashore' and a vast amount of material the greater part of which still remains unpublished. Among this are two dramas and 'A History of Seychelles' in two volumes. His son, Hugh Raymond McCrea, is an artist and poet well known in Australia; and his daughter, Dorothy Frances, is a clever story writer and a poet of some reputation in Australia. Deceased.

McCREA, Hugh Raymond, Australian artist. See McCrea, George Gordon.

McCREA, mą-krā', **Jane,** American Revolutionary heroine: b. Bedminster (now Lamington), N. J., 1753; d. near Fort Edward, N. Y., 27 July 1777. She was the daughter of a Scotc Presbyterian clergyman, at whose death sh went to live with her brother near Fort Ed ward, N. Y. At the commencement of th Revolution she was betrothed to David Jone an officer of the Crown. When Burgoyne army was advancing from the north she wa visiting a Mrs. MacNeil at Fort Edward. He brother, sharing the general alarm felt throug out the region, sent for his sister, intending t remove to a safer locality. On the mornin fixed upon for her departure, a band of Indian in the employ of Burgoyne suddenly swoope down upon the MacNeil household and the together with Miss McCrea, were mad prisoners. Mrs. MacNeil and her party arrive in safety at Burgoyne's camp, but half an hou later another party of Indians arrived, bearin a number of freshly severed scalps, one o which bore the long glossy hair of Miss Mc Crea, whose body was later found by a roadsid The precise manner of her death never becam known. The Indians claimed that she wa killed by a random shot from an American de tachment, whereupon her captors determine to secure the reward for her scalp. It has bee surmised that a quarrel arose among the Indian as to whose captive she was and that one of the in a frenzy tomahawked her. Other authoritie credit the story that Lieutenant Jones hired th Indians to bring his betrothed to camp when they were to be married and that she was kille in a controversy which arose as to whose cap tive she was. Lieutenant Jones denied this story he lived to an old age, a morose and gloom man. At all events the tragedy caused a gen eral feeling of horror throughout America an England. Burgoyne called a council of h Indian chiefs in order to reprove them, but a his allies would have deserted him the offende was allowed to go unpunished. A blasted pin long marked the spot where tradition relate the beautiful young girl was murdered, and he grave may be seen in a small cemetery near th ruins of Fort Edward. Consult Bascom, R. C 'The Fort Edward Book' (Fort Edward 1903 and Wilson, D., 'The Life of Jane McCrea (New York 1853).

McCREARY, James Bennett, America lawyer: b. Madison County, Ky., 8 July 1838; 8 Oct. 1918. He was graduated at Centre Co lege, Danville, Ky., in 1857, and from the La School of Cumberland University, Tennesse 1859. He entered the Confederate army in 1862 major of cavalry and served until close of wa being then lieutenant-colonel of the 11th Ken tucky Cavalry, C. S. A. He was a member the Kentucky house of representatives in 186 1871 and 1873 (being Speaker 1871–73); gove nor of Kentucky 1875–79, and a member of Co gress in 1885–97. He was a delegate to the I ternational Monetary Conference at Brusse Belgium, in 1891, and in 1903 became Unit States senator. In 1911–15 he was aga governor of Kentucky. He was delegate-a large to the Kansas City National Democrat Convention and to the Baltimore Convention 1912.

McCREERY, James, American merchan b. Ireland; d. Aiken, S. C., 1893. He came the United States when about 20 and engag in the dry goods business in Baltimore, and the beginning of the Civil War removed to Ne

York, where he soon established a business of his own which made him ultimately one of New York's leading merchants. He was a member of many public boards, one of the founders of the silk industry in America and director of numerous commercial enterprises. He was one of the Chamber of Commerce delegation sent to England two years before his death, and was a leading member of various clubs, chiefly of an educational or public character.

McCULLOCH, mą-kŭl'ō, Benjamin, American soldier: b. Rutherford County, Tenn., 11 Nov. 1811; d. 7 March 1862. He became a skilled hunter and boatman and joined other frontiersmen in settling Texas. In 1835 he served in the Texan war for independence, being in the battle of San Jacinto. Later he settled as surveyor at Gonzales and was elected to the Texas Congress in 1839. In the following year he was engaged in fighting the Comanches and operating against Mexican raiders. He also commanded a company of rangers in the Mexican War under Taylor and Scott, did important work as a scout, and was specially distinguished at the battles of Monterey and Buena Vista, and in the siege of the City of Mexico. In 1853 he was appointed United States marshal in Texas. In 1857 he was one of the commissioners appointed to settle the Mormon difficulties in Utah. During the Civil War he served in the Confederate army, was appointed brigadier-general and sent into Missouri, where he was defeated at the battle of Dug Spring, but later united his forces with those of General Price and then defeated the Federals under General Lyon (q.v.) at Wilson's Creek. He commanded a corps at the battle of Pea Ridge, Ark., where he was killed by a sharpshooter while making a reconnaissance. Consult Reid, S. C., 'Scouting Expeditions of McCulloch's Rangers' (Philadelphia 1859).

McCULLOCH, mą-kŭl'ōh, Hugh, American financier: b. Kennebunk, Me., 7 Dec. 1808; d. near Washington, D. C., 24 May 1895. He was educated at Bowdoin College and went in 1833 to Fort Wayne, Ind., where he established a law practice which he continued until 1835 when he entered a branch of the State Bank of Indiana. He was chosen director in 1836 and in 1857 became president of the newly incorporated State Bank of Indiana. He was appointed Comptroller of the Currency in 1863 and in 1865 became Secretary of the Treasury under President Lincoln. Owing to the enormous expenses incurred by the Civil War, the finances of the country were in a critical condition; in six months the large sum due 500,000 soldiers and sailors was paid together with other heavy expenses, and a reduction of the national debt was begun. McCulloch converted more than $1,000,000,000 of short-time obligations into a funded debt, and in less than two years had succeeded in putting the finances of the country on a sound basis. Congress approved his course and his plan for a speedy resumption of specie payment, but he met with opposition in his purpose to retire the legal-tender notes. He occupied the office until 1869 and in 1871 opened a banking business in London where he remained until 1878. He was reappointed to the Secretaryship of the Treasury by President Arthur in 1884 and continued in office until the close of the administration. He wrote 'Men and Measures of Half a Century,' and many of his speeches together with a large share of his correspondence have been published. He was the last living member of Lincoln's distinguished cabinet.

McCULLOCH, John Ramsay, English political economist: b. Whithorn, Wigtownshire, 1 March 1789; d. London, England, 11 Nov. 1864. He was educated at Edinburgh; became editor of *The Scotsman,* an Edinburgh newspaper, 1818–20, and from 1818 wrote many articles for the *Edinburgh Review.* He was professor of political economy in London University, 1828–32, and in 1838 was appointed comptroller of the stationery office. Among his many books may be mentioned 'The Principles of Political Economy' (1825); 'Historical Sketch of the Bank of England' (1831); 'Dictionary of Commerce' (1832); 'Geographical Dictionary' (1841); 'A Treatise on the Principles and Practical Influence of Taxation and the Funding System' (1845); 'The Literature of Political Economy' (1845), etc. He was one of the earliest advocates of free-trade in Great Britain.

MacCULLOUGH, mą-kŭl'ōk, John Edward, American tragedian: b. Coleraine, Ireland, 2 Nov. 1837; d. Philadelphia, 8 Nov. 1885. He came to the United States in 1853, studied for the stage and made his début in Philadelphia, 1857. He played with Edwin Forrest, who left him at his death all his manuscript plays. In 1869 he managed, with Lawrence Barrett, the Bush Street Theatre in San Francisco, Cal. His appearance in England in 1881 was not successful, but his popularity in America remained unbroken. Despite his lack of literary education, a serious handicap, he won high rank in his profession. He played De Mauprat to Edwin Booth's Richelieu, and Richmond to his Richard III. His interpretation of Virginius was unexcelled during his day. Among his leading rôles were Hamlet, Macduff, Richelieu, Spartacus, etc. In 1884, at the height of his brilliant career, he suddenly collapsed, both physically and mentally; he died a year later in an insane asylum in Philadelphia. Consult Clark, 'John McCullough as Man, Actor, and Spirit' (Boston 1905).

McCULLOUGH, John Griffith, American politician: b. Welsh Tract, near Newark, Del., 16 Sept. 1835; d. 29 May 1915. He was graduated from Delaware College in 1855 and from the law department of the University of Pennsylvania in 1858. He removed to California in 1859, engaged in law practice in Mariposa County, was elected to the State legislature in 1861, to the senate in 1862 and in 1863–67 was attorney-general. In 1867–73 he practised law in San Francisco and then removed to Bennington, Vt., where he became director and president of several railway systems and prominently connected with various banking and commercial enterprises. He was elected to the Vermont senate in 1898 and in 1902 was elected governor of the State.

McCUMBER, m'kŭm'bėr, Porter James, American legislator: b. Crete, Will County, Ill., 3 Feb. 1858. He was graduated at the University of Michigan in 1880 and engaged in the practice of law. He was the senior mem-

ber of the law firm of McCumber and Bogart at Wahpeton, N. Dak. (1881–1900). He served in the territorial House of Representatives in 1885–1889; was state's attorney, Richland County, in 1896–1897. He was elected to the United States Senate in 1899 and re-elected four times. He died May 18, 1933.

MacCUNN, mȧ-kŭn′, **Hamish,** Scottish composer: b. Greenock, Scotland, March 22, 1868; d. London, Aug. 2, 1916. Was educated in Greenock and at the Royal College of Music, London, made his début in the musical world in 1887, and in 1888 became a junior professor of harmony in the Royal Academy of Music, which position he resigned in 1894. As a composer he attained high rank; his productions are rich in melody, and his command of the orchestra is remarkable. His work is typically Scottish in character and in choice of subject. Among the more important of his numerous works are overtures, etc., *The Land of the Mountain and the Flood; Chior Mhor; The Dowie Dens o' Yarrow; The Ship o' the Fiend;* dramatic cantatas, *Lord Ullin's Daughter; Bonny Kilmeny; Lay of the Last Minstrel,* and the operas, *Jeannie Deans* and *Diarmid.*

MacCURDY, mȧ-kûr′dĭ, **George Grant,** American anthropologist: b. Warrensburg, Mo., April 17, 1863. He was graduated from the State Normal School, Warrensburg, 1887; from Harvard, 1893, A.M. in 1894, and thereafter studied at Vienna, Paris and Berlin. Since 1898 he has been connected with Yale University, becoming in 1923 research associate, with rank of professor, and curator of anthropological collections. His publications include *Some Phases of Prehistoric Archaeology* (1907); *Antiquity of Man in Europe* (1910); *Human Origins* 2 vols. (1924); *Prehistoric Man* (1928); *The Coming of Man* (1932). Since 1931 he has been professor emeritus.

McCURDY, James Frederick, Canadian Orientalist: b. Chatham, N. B., Feb. 18, 1847; d. April 30, 1935. He was educated at the University of New Brunswick, Princeton Theological Seminary and in Germany. He was assistant professor in Oriental languages at Princeton, 1873–1882; and Stone lecturer there in 1885–1886.. In 1886 he was appointed lecturer in University College of Toronto, and from 1888–1914 was professor of Oriental languages in that college. Among his works are *Aryo-Semitic Speech* (1881); *History, Prophecy and the Monuments* 3 vols. (1894–1901); *Life and Work of D. J. Macdonnell* (1897); an original commentary on Haggai, and various translations for the American edition of *Lange's Commentary.*

McCURDY, Richard Aldrich, American capitalist: b. New York City, Jan. 29, 1835; d. Morristown, N. J., March 6, 1916. He was graduated at Harvard University in 1856, and engaged in the practice of law in New York. He became attorney for the Mutual Life Insurance Company in 1860, vice president in 1865 and was president in 1885–1906. The investigation of his company in 1905 revealed mismanagement and gross extravagance, particularly in the matter of salaries for the officials. He resigned and retired in 1906.

McCUTCHEON, mȧ-kŭch′ŭn, **George Barr,** American novelist: b. near Lafayette, Ind., July 26, 1866; d. 1928. Educated at private schools and at Purdue University. After leaving college, before graduation, he became a reporter on the Lafayette *Morning Journal,* at a salary of $6 a week. Prior to that time he had written a series of dialect letters for the *Sunday Leader,* of Lafayette, under the caption *Waddleton Mail,* published in that paper in 1890. After three years on the *Journal,* he became city editor of the Lafayette *Daily Courier,* servin that capacity until June 1902, when newspaper work was abandoned for novel writing alone. While with the *Courier,* he contributed to that newspaper a serial story entitled *The Wired End,* which has never been published in book form; and also contributed short stories to various magazines during these years. He went to Chicago to reside in 1902, and in July 1910 removed to New York City.

His novels include *Graustark* (1901), dramatised; *Castle Craneycrow* (1902); *Brewster's Millions* (1903), dramatised; *The Sherrods* (1903); *The Day of the Dog* (1904), novelette; *Beverly of Graustark* (1904), dramatised; *The Purple Parasol* (1905), novelette; *Nedra* (1905); *Cowardice Court* (1906), novelette; *Jane Cable* (1906); *The Flyers* (1906), dramatised, novelette; *The Daughter of Anderson Crow* (1907); *The Husbands of Edith* (1908), novelette, dramatized; *The Man from Brodney's* (1908); *Truxton King* (1909), dramatized; *A Fool and His Money* (1913); *Black is White* (1914); *The Prince of Graustark* (1914); *Mr. Bingle* (1915); *The Light That Lies* (1917); *Shot with Crimson* (1918); *Sherry* (1918); *Anderson Crow, Detective* (1920); *Yollopp* (1922); *Oliver October* (1923); *East of the Setting Sun* (1924); *Romeo in Moon Village* (1925).

McCUTCHEON, John Tinney, American cartoonist: b. near South Raub, Ind., May 6, 1870; d. Lake Forest, Ill., June 10, 1949. He was graduated from Purdue University in 1889 and was connected with the leading newspapers of Chicago from 1889, his work as a cartoonist becoming famous in the campaign of 1896. He started around the world on dispatch boat *McCulloch* in January 1898; was on board that vessel, during the war with Spain, in the Battle of Manila Bay 1898. In 1899 he made a tour of special service in India, Burma, Siam, and Cochinchina and later in northern China, Korea, and Japan, returning to the Philippines during the fall campaign there. He followed the various campaigns on the islands until April 1899 when he was sent to the Transvaal. He joined the Boers in the interest of his paper and furnished political cartoons for the Chicago *Record* during the campaign of 1900. In 1909–1910 he visited Africa, the while contributing articles and cartoons for the Chicago *Sunday Tribune.* He went to Mexico as special correspondent in 1914; was with the Belgian and German armies in the autumn of the same year, and in France, Salonika and the Balkans in 1915–1916. He has published *Stories of Filipino Warfare* (1900); *Cartoons by McCutcheon* (1903); *Bird Centre Cartoons* (1904); *The Mysterious Stranger and Other Cartoons* (1905); *Congressman Pumphrey the People's Friend* (1907); *In Africa* (1910); *T. R.* in *Cartoons* (1910); *Dawson '11—Fortune Hunter* (1912); *An Heir at Large.* In 1931 he was

awarded a Pulitzer Prize for the excellence of his cartoons. He was president of the Chicago Zoological Society from 1921; and a fellow of the Royal Geographical Society.

McDANIEL, Henry Dickerson, American state governor: b. Monroe, Ga., Sept. 4, 1836; d. there, July 25, 1926. He graduated from Mercer University, Macon, Ga., 1856, and was admitted to the bar in 1857. He attended as delegate the Georgia Secession Convention in 1861; and served in the Confederate Army until the end of the war, attaining the rank of major in the 11th Georgia Infantry. In 1865 he was a member of the Georgia Constitutional Convention. He served in the state legislature, 1873–1874, and was state senator, 1874–1883; from 1883 to 1886 he was governor of Georgia.

McDANIEL, Walton Brooks, American philologist and educator: b. Cambridge, Mass., March 4, 1871. He graduated from Harvard in 1893. He was assistant in Latin and Greek at Harvard in 1896–1897, instructor there and at Radcliffe College in 1899–1901, and from 1909 was professor of Latin at the University of Pennsylvania. He wrote *Roman Private Life and Its Survivals* (1924); and *Guide for the Study of English Books on Roman Private Life* (1926).

McDIARMID, măk-dĭr'mĭd, **Hugh** (pseudonym of CHRISTOPHER MURRAY GRIEVE), Scottish author and poet: b. Langholm, Dumfriesshire, Aug. 11, 1892. An ardent nationalist, he is known as one of the founders of the Scottish Nationalist Party and the editor of *The Voice of Scotland,* a quarterly magazine. Among his works in prose are *Annals of the Five Senses; Albyn, or the Future of Scotland; Scottish Scene; Scottish Eccentrics; The Scottish Islands;* and an autobiography entitled *Lucky Poet.* His volumes of verse include: *Sangschaw; Penny Wheep; A Drunk Man Looks at the Thistle; Stony Limits; First Hymn to Lenin; Cornish Heroic Song for Valda Trevlyn.*

McDONALD, Andrew Archibald, Canadian statesman: b. Three Rivers, Prince Edward Island, Feb. 14, 1829; d. March 21, 1912. He entered public life in 1853 as a member of the island assembly, serving until 1858, and again in 1863–1874. He was a delegate to the Quebec Conference on the Union of the Provinces in 1864; and in 1873 became provincial postmaster general, also serving as acting post office inspector until 1884. In 1884–1889 he was lieutenant governor of the province, and from 1891 he was a member of the Dominion Senate.

MacDONALD, Arthur, American criminologist and author: b. Caledonia, N.Y., July 4, 1856; d. Washington, D.C., Jan. 17, 1936. He was educated at the University of Rochester and the Princeton and Union theological seminaries, and later studied medicine at Berlin, Leipzig, Paris, Zürich, and Vienna. From 1892 till 1904 he was connected with the United States Bureau of Education as a specialist in possibilities of education for the abnormal and weakling classes. He represented the United States at three international psychological and criminological congresses, and was honorary president of the Congress of Criminal Anthropology, in Europe. He made a special study of American and European prisons and asylums for the insane and for inebriates. His books include: *Abnormal Man* (1893); *Education and Patho-Social Studies* (1896); *Statistics and Crime, Suicide and Insanity* (1903); *Juvenile Crime and Reformation* (1908); *Mentality of Nations and Social Pathology* (1912).

MACDONALD, SIR **Claude Maxwell,** British soldier and diplomat: b. June 12, 1852; d. London, Sept. 10, 1915. In 1872, after attending the Royal Military College, Sandhurst, he was commissioned 2d lieutenant in the 74th Highlanders. He served in the Egyptian campaign in 1882, and took part in the Suakin expedition, in the eastern Sudan, during 1884–1885; in 1887 he was appointed consul general at Zanzibar. Transferred to West Africa a year later, in 1891 he became the first British administrator in the Oil Rivers Protectorate (which later became the colony of Nigeria). In 1896 he was appointed British minister at Peking (Peiping); he organized the defense of the foreign legations in that city, when they were besieged during the Boxer Rebellion (see BOXERS). June–August, 1900. Appointed in October 1900 Great Britain's first ambassador ot Tokyo (previous diplomats holding only the rank of minister), he was responsible in considerable measure for effecting the Anglo-Japanese alliance of 1905.

MACDONALD, Duncan Black, American professor of theology: b. Glasgow, Scotland, April 9, 1863; d. Hartford, Conn., Sept. 6, 1943. After graduating from the University of Glasgow in 1885 he studied at the University of Berlin, and came to the United States in 1892, from which date until 1931 he was professor of Semitic languages at Hartford Theological Seminary. He was Haskell lecturer on comparative religion at the University of Chicago, 1906; special lecturer at Wellesley College, 1907–1909; at the Episcopal Theological School, Cambridge, 1912; Lamson lecturer on Mohammedanism at Hartford Theological Seminary, 1909; head of the Mohammedan department at the Kennedy School of Missions, Hartford, 1911–1925; Haskell lecturer, Oberlin College, 1914; lecturer on the Old Testament, Berkeley Divinity School, 1917–1918. He discovered in the Bodleian Library (q.v.) in 1910 the only known Oriental manuscript of *Ali Baba and the Forty Thieves* which he published in the *Journal* of the Royal Asiatic Society of Great Britain, of which he was a member. His writings include *The Development of Muslim Theology* (1903); *Aspects of Islam* (1911); *Hebrew Literary Genius* (1933); *Hebrew Philosophical Genius* (1935).

MACDONALD, Flora, Scottish Jacobite heroine: b. Milton, South Uist, Hebrides, 1722; d. Kingsburgh, Scotland, March 5, 1790. She lost her parents early, and was brought up by the chief of her clan, Macdonald of Clanranald; later she was adopted by Lady Macdonald of Skye. After the Battle of Culloden, in 1746, her assistance was sought in securing the escape of Prince Charles Edward, who had taken refuge at Benbecula, where Flora MacDonald was then living. The prince was disguised as a woman servant and the party succeeded in reaching Skye in safety. Flora's assistance to the prince became known, however, and she was imprisoned in the Tower of London, but was soon after-

ward permitted to live outside the prison, although under charge of a jailer. The Indemnity Act of 1747 secured her complete liberty. She was married to Allan Macdonald in 1750, and in 1774 they emigrated to America, settling in Fayetteville, N.C. Her husband served in the British Army in the Revolutionary War, and was taken prisoner. Flora returned alone to Scotland in 1779, and was later rejoined by her husband. She was a woman of great beauty and charm of manner, Dr. Samuel Johson among others, being warm in her praises. Five of her sons served in the British Army or Navy. Consult Ewald, A. C., *Life and Times of Prince Charles Edward* (1886); Macgregor, A., *Flora Macdonald and Her Adventures with Prince Charles* (1901).

MACDONALD, George, Scottish poet and novelist: b. Huntly, Aberdeenshire, Dec. 10, 1824; d. Ashtead, Surrey, Sept. 18, 1905. He was educated at Aberdeen University and at King's College, London, and entered the Independent ministry, from which he afterward retired and became a lay member of the Anglican Church. Macdonald's work comprised poetry, novels, and religious and juvenile books, and was marked by deep religious feeling and devotion to lofty ideals of life. His novels dealt chiefly with Scottish character and scenery, in which they held the place of classics. The best known of his many books were *David Elginbrod* (1862); *Alec Forbes of Howglen* (1865); *Annals of a Quiet Neighborhood* (1866); *Robert Falconer,* his best work (1868); *The Miracles of Our Lord* (1870); *Malcolm* (1875); *The Marquis of Lossie* (1877); *Sir Gibbie* (1879); *Castle Warlock* (1882).

MACDONALD, Sir Hector Archibald, British army officer: b. Muir of Allan-Grange, Ross-shire, Scotland, April 13, 1853; d. Paris, France, March 25, 1903. In 1870 he enlisted in the 92d (Gordon) Highlanders, and for nine years served in the ranks. He first saw active service in the Second Afghan War, in 1879, acquitting himself with such distinction that he was given a commission as second lieutenant. During the Anglo-Boer War of 1880–1881 he was captured at Majuba Hill. He was sent to Egypt in 1884 to aid in reorganization of the Egyptian Army, and took part in the operations on the Nile in 1885 and the Suakin campaign in 1888–1891; for his part in the capture of Tokar in 1891 he was awarded the Distinguished Service Order. During the Dongola expedition of 1896 he commanded a brigade of Egyptian troops, and by his adroit handling of his troops at the Battle of Omdurman, in 1898, he turned into victory what might have proved a disaster. He was promoted colonel that same year, and in 1899, with the rank of major general, he commanded troops in the Punjab Province of India. In December 1899, following outbreak of the South African War (q.v.), "Fighting Mac," as he was popularly termed, was given command of the Highland Brigade, for service under Lord Roberts (see Roberts of Kandahar). He captured Koodoesberg early in February 1900, and after Kimberley was relieved, led his Highlanders in a series of engagements which resulted in the surrender at Paardeberg of Gen. Piet Arnoldus Cronjé (q.v.). In 1901 he received a knighthood, and the next year was appointed to command the troops in Ceylon. Recalled to Britain to answer charges against him, he committed suicide in a Paris hotel.

MACDONALD, Sir Hugh John, Canadian statesman, son of Sir John Alexander Macdonald (q.v.): b. Ontario, March 13, 1850; d. March 29, 1929. He was educated at Queen's College and at the University of Toronto, became a barrister in 1872, practicing in Toronto until 1882, when he removed to Winnipeg. In 1891–1893, and again in 1896–1897, he was a member of the Canadian House of Commons; and in 1896 he was minister of the interior. He was premier and attorney general of Manitoba in 1900. After 1911 he was police magistrate of the city of Winnipeg, and he also served as commissioner of railways in Manitoba. He served in the Fenian Raid of 1866 and the Red River Expedition of 1870; and in the Northwest Rebellion he was captain of the 19th Regiment. He was knighted in 1913.

MACDONALD, Jacques Étienne Joseph Alexandre, Duc de Tarente. French military officer: b. Sedan, Nov. 17, 1765; d. Courcelles-le-Roi, Sept. 7, 1840. Of Scottish descent, he was related to Flora Macdonald (q.v.). He served in the French Revolution as colonel, brigadier general and general. In 1798 he was made governor of the Roman states, and of Naples the following year. In 1805 he lost the favor of Napoleon, but four years later was given command of the right wing of the army in Italy; he was made a marshal for his services at Wagram, July 6, 1809. He served in Spain and in the Russian campaign, assisted in covering the retreat from Leipzig, and in 1814 advised Napoleon's abdication. At the Restoration (q.v.) he gave his allegiance to Louis XVIII. Created a peer of France, in 1816 he became major general of the royal bodyguard; he retired in 1830.

McDONALD, James, Canadian statesman and jurist: b. East River, Nova Scotia, July 1, 1828; d. 1912. He was educated at New Glasgow, was admitted to the bar in 1851, and became queen's counsel in 1867. He served in the legislature of Nova Scotia in 1859–1867 and in 1871–1872, when he resigned; and was a member of the Canadian Parliament in 1874–1881. In 1863–1864 he was chief railway commissioner for Nova Scotia, and financial secretary from 1864 until the union with the Dominion of Canada in 1867. He was minister of justice of Nova Scotia in 1878–1881, and chief justice in 1881–1904.

MACDONALD, James Alexander, Canadian journalist: b. East Williams, Middlesex County, Ontario, Jan. 22, 1862; d. Toronto, Ontario, May 13, 1923. Nationally known as "Masdonald of the *Globe*," James Alexander was educated at Knox College, Toronto, and in 1891 was ordained to the ministry of the Presbyterian Church. In 1891–1896 he was pastor of Knox Church, St. Thomas, Ontario. In the latter year he founded a religious paper in Toronto, which he called the *Westminster*. In 1902 he became managing editor of the Toronto *Globe*. In this post he acquired a national reputation and great influence and left his mark on Canadian journalism and on Canadian public life. Ill health forced a partial retirement in 1916. He collected many of his papers and addresses in *Democracy and the Nations* (1915) and *The North American Idea* (1917). He also published a memorial volume on William Caven of Knox College (1908).

McDONALD, James Alexander, Canadian jurist: b. 1858, Huron County, Ontario; d. Victoria, British Columbia, Dec. 20, 1939. Educated at the University of Toronto, he became a barrister in 1890 and king's counsel in 1906. He engaged in practice in Toronto until 1896 when he removed to Rossland, British Columbia, where he practiced until 1909. In that year he became chief justice of the Court of Appeals, British Columbia, and in 1929 he became chief justice of British Columbia. He retired in 1937.

MacDONALD, James Ramsay, British statesman: b. Lossiemouth, Scotland, Oct. 12, 1866. He received an elementary education and became a teacher. In 1884 he came to London where he worked as a clerk for $3.12 per week. In the capital he continued his education by attendance at evening classes. His experiences led him to embrace Socialism and in 1894 he joined the Independent Labor Party. He was elected to the London County Council in which body he developed his abilities as a public speaker. In 1897, Mr. MacDonald visited the United States and Canada and subsequently visited South Africa, New Zealand, Australia and India. He helped found the Labor Party in 1900. Six years later he was elected to Parliament from Leicester. He opposed Great Britain's entry into the World War, was widely denounced therefor, and in the election of 1918 lost his seat. In 1922 he was re-elected and as head of the Labor Party became leader of the opposition. Following the general election of 1923, the Labor Party expressed its willingness to take office and on Jan. 24, 1924 a Labor Government, the first in British history, took the reins of government, with Mr. MacDonald as Prime Minister and Foreign Secretary. He remained in office until his party suffered defeat in the election of October 1924. He and his party were returned to power in May 1929 and Mr. MacDonald again assumed the Premiership. He visited President Hoover the same year. His government was at once faced with the problem of unemployment and managed to weather many storms until the financial crisis in the summer of 1931 forced a policy of retrenchment on the government in which the rank and file of the Labor Party was unwilling to follow its leader. Mr. MacDonald thereupon formed a "National" government in which he included members of all parties. In the elections of October 1931, the Labor Party suffered a serious setback, but MacDonald headed the new coalition government (Nov. 1931), and continued in office until he resigned, June 7 1935, because of ill health. Died at sea, Nov. 9, 1937.

MacDONALD, James Wilson Alexander, American sculptor: b. Steubenville, Ohio, Aug. 25, 1824; d. Aug. 14, 1908. He studied under Waugh in Saint Louis and in New York in 1849. Among his numerous works are statues of *Joan of Arc; Italia; Edward Bates;* etc.

MACDONALD, Sir John Alexander, Canadian statesman: b. Glasgow, Scotland, Jan. 11, 1815; d. Ottawa, Ontario, June 6, 1891. In early youth he emigrated with his father to Canada. At 21 he was a practising barrister at Kingston, Upper Canada, and in 1844 he was elected to the Canadian Parliament for that constituency. He became a cabinet minister in 1847, and, after various vicissitudes of his party, Prime Minister in 1857. Macdonald's most important work is connected with the federation of Canada. The French and the English provinces, previously independent, had been united under one Parliament in 1841, and during the next 25 years each party had both an English and a French leader. Ministries changed rapidly, and in 1864 there was a deadlock. This made necessary some wider union; and in that year a conference of delegates met at Quebec to consider the federation of British North America. Directed largely by Macdonald's tact and resource this conference led to the establishment of the Dominion of Canada in 1867, under the British North America Act, passed by the British Parliament. Macdonald became the first Prime Minister of the Dominion. At first there were only four provinces, but he carried through successfully the negotiations by which the Hudson Bay company ceded its interests in the northwest to Canada; he secured also the entrance of British Columbia on the condition of building rapidly a transcontinental railway. During an election in 1872 Macdonald accepted large sums for party purposes from Sir Hugh Allan, one of the chief projectors of the Pacific railway, and in 1873 owing to this "Pacific Scandal" he was forced to retire from office. In 1878 he again became Prime Minister with a policy of protection and he may be regarded as the father of that system in Canada. He remained Prime Minister until his death in 1891. The confederation of Canada, the acquisition by Canada of the Northwest, the building of the Intercolonial and the Canadian Pacific railways, and the policy of protection were all effected under Macdonald's lead. His brilliant intellect and ready wit made him a really great leader. In 1867 he was created K.C.B., in 1884 G.C.B., and on his death his widow was created Baroness Macdonald in her own right. Consult Pope's *Memoirs of Sir John A. Macdonald* (1894); Parkin, *Sir John A. Macdonald* in *Makers of Canada* (1908).

GEORGE M. WRONG,
Professor Emeritus of History, Univ. of Toronto.

McDONALD, John Bartholomew, American engineer and contractor: b. Ireland, Nov. 7, 1844; d. March 17, 1911. He was brought to the United States in 1847, and received his education in the public schools of New York. Among his successful undertakings may be mentioned the Fourth avenue improvement for sinking the New York Central Railroad tracks in New York City from 42d street to Harlem; West Shore Railroad from Weehawken to Buffalo; Baltimore and Ohio Railroad from Baltimore to Philadelphia; Illinois Central Railroad from Elgin, Ill., to Dolgeville, Wis.; the Georgian Bay branch of the Canadian Pacific Railroad; the Trenton "cut-off" of the Pennsylvania Railroad; the Baltimore Belt Railroad, which carried the great Baltimore and Ohio Railroad under the city of Baltimore, etc. He constructed the Jerome Park reservoir, New York City, one of the largest artificial storage reservoirs in the world. His greatest contract was for the construction, equipment, operation and maintenance of the Rapid Transit Railroad (the "Subway") in New York City.

MACDONALD, John Sandfield, Canadian statesman: b. Saint Raphael's, Canada, Dec. 12,

1812; d. Cornwall, Ontario, June 1, 1872. He was self-educated and admitted to the bar in 1840, practicing successfully in Cornwall. In 1841 he was elected to the Canadian Parliament as member from Cornwall. He was solicitor general in 1849–1851; and was speaker of Parliament in 1852–1854. During the brief Brown-Dorion administration in 1858 he served as attorney general, and was premier from 1862–1864. He was the first premier of the Province of Ontario, 1867–1871.

MACDONALD, Lucy Maud Montgomery, Canadian novelist: b. Clifton, Prince Edward Island, Canada, 1874; d. Toronto, Ontario, April 24, 1942. She was authoress of *Anne of Green Gables* (1908), which was described by Mark Twain as "the sweetest creation of child life ever written"; *Anne of Avonlea* (1909); *Anne of the Island* (1915); *The Watchman* (1916); *The Blue Castle* (1926); and *Jane of Lantern Hill* (1937).

MacDONALD, Malcolm, British statesman: b. Lossiemouth, Scotland, Aug. 17, 1901. He attended Bedales School, Petersfield, England, and afterward was graduated from Queen's College, Oxford. A Laborite, he entered the British House of Commons in 1928 representing the Bassetlaw Division of Nottingham. Two years later he entered the British ministry as parliamentary under secretary of state for Dominion affairs, and in 1935 he became a member of the Cabinet as secretary of state for the colonies—a post which he again held in 1938–1940. Meanwhile, in 1935–1938 he served as secretary of state for Dominion affairs, and again held the post in 1938–1939. He was made a privy councilor in 1935. In 1941 he was chosen to succeed Sir Gerald Campbell as British high commissioner to Canada, a position he held until 1946, when he was appointed governor general of Malaya and British Borneo. He has been commissioner general for the United Kingdom in southeast Asia since 1948.

MacDONALD, William, American journalist and historian: b. Providence, R. I., July 31, 1863; d. New York, New York, Dec. 15, 1938. He was graduated at Harvard in 1892, and was professor of history and economics at Worcester Polytechnic Institute, 1892–1893. He was professor of history and political science at Bowdoin, 1893–1901; was professor of history at Brown University, 1901–1917; on the editorial staff of *The Nation,* 1918–1931; and lectured on American history at Yale, 1924–1926.

He edited *Select Documents Illustrative of the History of the United States* (1898); *Johnston's High School History of the United States* (1901); *Documentary Source Book of American History* (1908); *Parkman's Oregon Trail* (1911). He was author of *Jacksonian Democracy* (1905); *A New Constitution for America* (1923); *The Intellectual Worker and his Work* (1923); *Three Centuries of American Democracy* (1923); and *The Menace of Recovery* (1934).

MacDONALD, Sir William Christopher, Canadian capitalist and philanthropist: b. Glenaladale, Prince Edward Island, Canada, 1831; d. Montreal, June 9, 1917. He early engaged in business in Montreal and achieved a large financial success as importer, merchant, and tobacco manufacturer. He was a director of the Bank of Montreal, chancellor of McGill University to which he contributed large gifts, and governor of Montreal General Hospital. He also served as president of the Legislative Council of Prince Edward Island. He founded the Macdonald Agricultural College, and made large gifts to the normal school at Ste. Anne de Bellevue, Quebec, and to the Ontario Agricultural College. He was knighted in 1898.

McDONALD, borough, Pennsylvania, in Allegheny and Washington counties; on the Mountour and Pennsylvania railroads; 18 miles southwest of Pittsburgh. McDonald is a coal mining and oil field community; a large coal washing plant is located near by. Pop. (1950) 3,543.

MacDONALD, Lake, lake, Australia, in the western part, 540 miles south of Wyndham. It is 12 miles wide and 20 miles long. During most seasons it is dry, but is surrounded with swamps.

MacDONELL, măk-dŏn'ĕl, **Alexander,** Canadian Roman Catholic prelate: b. Inverness, Scotland, July 7, 1762; d. Dumfries, Jan. 14, 1840. He was educated at the Scots College, Spain, entered the priesthood in 1787, and was for several years a missionary. He assisted in the organization of the Glengarry Fencibles and was their chaplain and in 1803 established for its disbanded members a colony in Glengarry County, Ontario, Canada. He also assisted in raising the Canadian regiment of Glengarry Fencibles, which was actively engaged in repelling the American invaders in the War of 1812–1814. In 1819 he was made vicar apostolic of Upper Canada and through his influence 48 parishes were established in Upper Canada. He was the first Roman Catholic bishop in Upper Canada, being consecrated bishop of Kingston, Feb. 14, 1826. He was called to the Legislative Council in 1831. He died in Scotland while on a mission to obtain funds for the founding of Regiopolis College, Kingston, and is buried in his episcopal city.

MacDONELL, măk-dŏn"l, **Arthur Anthony,** English Sanskrit scholar: b. Lochgarry, India, May 1, 1854; d. Dec. 28, 1930. He was educated at Göttingen and at Corpus Christi College, Oxford. He was teacher of German at Oxford, 1880–1899; and professor of Sanskrit in 1888–1899, after which he was Boden professor of Sanskrit there. He made a tour of study and research in India in 1907–1908, and in 1914 received the Campbell Memorial Gold Medal for Oriental Research from the Royal Asiatic Society of Bombay. He was keeper of the Indian Institute; and a fellow of Balliol College and of the Royal Danish Academy.

He was author of *Sanskrit-English Dictionary* (1892); *Vedic Mythology* (1897); *A History of Sanskrit Literature* (1900); *The Brhaddevatā,* translated and critically edited, 2 vols. (1904); *Vedic Grammar* (1910); *A Vedic Grammar for Students* (1916); and *India's Past . . .* (1927).

MacDONNELL, Antony Patrick, Baron MacDonnell of Swinford, British government administrator: b. March 7, 1844; d. London, England, June 9, 1925. He was educated at Queen's College, Galway, and entered the Indian Civil Service in 1865. He was appointed acting chief commissioner of Burma in 1889, chief commis-

sioner of the Central Provinces in 1891, acting lieutenant-governor of Bengal in 1893, and served on the council of the viceroy of India in 1893–95. He was lieutenant-governor of the Northwestern Provinces and chief commissioner of Oudh in 1895–1901, was a member of the Council of India in 1902, and Under Secretary of State in Ireland in 1902–08. He was created a baron in 1908.

McDONNELL, Charles Edward, American Roman Catholic prelate: b. New York, N. Y., 1 Feb. 1854; d. 8 Aug. 1921. He was educated at the De La Salle Institute and Saint Francis Xavier's College in New York and studied theology at the American College, Rome, Italy, where he received the degree of D.D., and was ordained priest by Bishop Chatard 18 May 1878. Returning to America the same year, he was appointed assistant at Saint Mary's Church, New York City, and in 1879 was transferred to Saint Patrick's Cathedral. On the death of Bishop Loughlin, Dr. McDonnell, who, at the time was Archbishop Corrigan's secretary, was named bishop of Brooklyn, being consecrated by Archbishop Corrigan 25 April 1892. At his invitation the Benedictine Fathers came from the Bahama Islands to establish themselves in his diocese, and the Redemptorists also made a foundation in Brooklyn. On the passage of the French law separating Church and State, Dr. McDonnell invited a number of French communities of men and of women to take up their residence in his diocese. He was spiritual adviser of the Catholic Benevolent Legion, and also honorary president of the International Catholic Truth Society.

McDONOGH, măk-dŏn'ō, **John,** American philanthropist: b. Baltimore, Md., 29 Sept. 1779; d. McDonogh, La., 26 Oct. 1850. He was educated at an academy in Baltimore and entered the mercantile business there, removing in 1800 to New Orleans, where he rapidly acquired great wealth. He was deeply interested in the problem of slavery and devised a system through which his slaves were enabled to earn their freedom; he educated those among them who desired it, and sent to Africa shiploads of those who had earned their freedom. He was president of the American Colonization Society and was a generous contributor to its support. The bulk of his fortune of more than $2,000,000 he bequeathed to the cities of New Orleans and Baltimore for the establishment of free schools. The will was adjudged valid after years of litigation and Baltimore established the McDonogh schools while New Orleans invested its portion of the bequest in its public schools.

MACDONOUGH, măk-dŏn'ō, **Thomas,** American naval officer: b. Newcastle County, Del., 23 Dec. 1783; d. at sea, 18 Nov. 1825. He entered the navy as midshipman in 1800 and in 1803 was attached to the frigate *Philadelphia,* one of the squadron employed against Tripoli. On 26 Aug. 1803 the *Philadelphia* captured off the coast of Spain the Moorish frigate *Mesboa* and MacDonough, being left at Gibraltar with the prize, escaped the subsequent capture which befell the officers and crew of the *Philadelphia.* In 1804 he participated in the various attacks made upon Tripoli and under Decatur assisted in the capture and destruction of the *Philadelphia,* 16 Feb. 1804. In 1810 he was furloughed and for a while commanded a vessel in the merchant service. On the outbreak of the War of 1812 he was for a time first lieutenant on the *Constitution,* and commanded for some months at Portland. In 1814 he had command of the squadron on Lake Champlain which gained an important victory at Plattsburg harbor over the British squadron commanded by Commodore George Downie. For his valuable services on this occasion he was promoted to the rank of captain, then the highest in the United States navy, and received from Congress a gold medal and an estate at Cumberland Head, near Plattsburg, from the Vermont legislature. He afterward held various commands, the last of which was on the *Constitution* in 1824, in which he made a cruise to the Mediterranean. Consult Babcock, K. C., 'Rise of American Nationality' (New York 1906).

MACDOUGAL, mak-doo'gal, **Daniel Trembly,** American botanist: b. Liberty, Ind., 16 March 1865. He was graduated at De Pauw University in 1890 and studied in Germany. In 1891–92 he was engaged in explorations in Arizona and Idaho for the United States government, and in 1893–99 was instructor in plant physiology at the University of Minnesota. He was appointed director of the laboratories of the New York Botanical Gardens in 1899, and after 1905 was director of the botanical research department of the Carnegie Institution. He was president of the American Society of Naturalists in 1910. Among his books are 'Nature and Work of Plants' (1900); 'Practical Text-book of Plant Physiology' (1902); 'Elementary Plant Physiology' (1902); 'Influence of Light and Darkness upon Growth and Development' (1903); 'Botanical Features of North American Deserts' (1908); 'The Water-Balance of Succulent Plants' (1910); 'The Condition of Parasitism in Plants' (1910); 'Organic Response' (1911); 'The Salton Sea' (1913); 'Growth in Trees' (1924).

McDOUGALL, Alexander, American soldier: b. Island of Islay, Scotland, 1731; d. New York, 8 June 1786. He emigrated with his father to America in 1755 and later became a merchant in New York. He devoted himself to the cause of the colonies and was imprisoned for a time for writing an address called 'A Son of Liberty to the Betrayed Inhabitants of the Colony.' At the outbreak of the Revolution he enlisted in the American army, serving as colonel, brigadier-general, and in 1777 was promoted major-general. He commanded at Long Island, White Plains and also attained distinction in the action at Germantown. He was elected member of the Continental Congress in 1781 and was for a time Minister of Marine. Re-elected in 1784–85 he served for a time and then resigned, preferring active service in the field. He was elected Minister of Marine and thereby became the first Secretary of the United States Navy. He was a member of the New York State senate at his death.

McDOUGALL, George Millward, Canadian pioneer missionary: b. Kingston, Ontario, 1820; d. Canadian North West, January 1876. He removed to Georgian Bay with his parents when a child, later studied at Victoria College.

and in 1850 entered the Wesleyan Methodist ministry. He was deeply interested in the welfare of the Indians, whose habits and character he knew thoroughly, and spent his life as a missionary among them. His field covered at different times a considerable portion of the Northwest Territory and his experience made him often a valuable aid to the government in dealing with Indian affairs. He made a tour of eastern Canada and visited New York and Great Britain in 1875. His career was suddenly ended by his death on the plains within a short distance of his camp. He is commonly reputed to have perished in a snowstorm; but his son, who was with him on the journey toward camp, ascribes the end to some unknown physical infirmity as the weather was favorable and his father a master woodsman. McDougall is among the most famous of the pioneer missionaries of Canada. Consult McDougall, J., 'George Millward McDougall, Pioneer, Patriot and Missionary' (Toronto 1888).

McDOUGALL, John, Canadian missionary, son of George Millward McDougall (q.v.): b. Owen Sound, Ontario, 27 Dec. 1842. He was educated at Victoria University, entered the Methodist ministry in 1866 and was ordained in 1872. He was reared among the Indians of the Georgian Bay and Lake Superior regions and before entering the ministry he taught school in the North Western Territory. As a clergyman his work was chiefly among the Indians, where his knowledge of their language and customs made his work unusually effective, and he was also able to render important services to the government in connection with Indian affairs. He was peace commissioner after the uprisings of 1869–70 and 1885. He was also closely associated with the treaties made with the Indians in his district. He was chairman of the Saskatchewan district in 1876 and of the Indian district in 1897. Author of 'A Cree Hymn Book' (1888); 'Forest, Lake and Prairie' (1895); 'Saddle, Sled and Snowshoe' (1896); 'In the Days of the Red River Rebellion' (1900); 'On the Western Trail in the Early Seventies' (1902). D. 15 Jan. 1917.

MacDOUGALL, Sir Patrick Leonard, British general and military author: b. Boulogne-sur-Mer, France, 10 Aug. 1819; d. Kingston Hill, Surrey, 28 Nov. 1894. He was educated at the military academies of Edinburgh and Sandhurst and received his commission as second lieutenant in 1836. He served as regimental officer with the Royal Canadian Rifle regiment at Toronto and at Kingston in 1844–54; served as superintendent of studies at Sandhurst the following year, and in 1855 was sent on a special mession to the Crimea. He was again superintendent at Sandhurst in 1856–58. He was appointed adjutant-general of the Canadian militia in 1865, took an active part in the suppression of the Fenian Raid of 1866 and received high commendations for his skilful organizing of the militia. In 1873–78 he was head of the intelligence branch of the War Office. He was again appointed to the command in Canada in 1878, at the time when relations were strained between England and Russia. He volunteered to organize a body of 10,000 trained soldiers for use whenever and wherever they might be needed, and the acceptance of his offer established the precedent of colonial military aid to the empire in time of need. He retired from active service in 1885. Author of 'The Theory of War' (1856); 'Modern Warfare as Influenced by Modern Artillery' (1864) 'The Army and Its Reserves' (1869), etc.

McDOUGALL, William, an Anglo-American psychologist: b. Lancashire, England, 1871. He studied at Owens College, Manchester, and at Oxford, Cambridge and Gottingen universities. In 1914, at the outbreak of the World War, he was reader in mental philosophy and fellow of Corpus Christi College, Oxford. During the war, he was attached to the medical service of the British army, and at its close returned to Oxford. In 1920 he was called to Harvard University to become head of the department of psychology. He remained there until 1927 when he accepted the chair of psychology at Duke University, Durham, N. C. His published works deal chiefly with the problems of national psychology which involve ethical theory, and cannot be discussed in terms of mere science. D. Durham, N. C., 28 Nov. 1938.

MacDOWELL, măk-dow'ĕl, **Edward Alexander,** American composer: b. New York 18 Dec. 1861; d. there, 23 Jan. 1908. MacDowell was Scotch-Irish by birth, if not by training and temperament. It was from his father, a man of pronounced artistic tastes, that the composer inherited or acquired that fine æsthetic sense and that highly sensitive artistic tendency which played so great a part in his life and practically determined the character of his work. MacDowell's musical education was begun at the age of eight, when Juan Buitrago, a friend of the family, gave him his first piano lessons. But not being at all precocious — MacDowell was no musical prodigy — his early progress was neither rapid nor encouraging. It was not until he came to receive instruction from the professional piano teacher, Paul Desvernine, with occasional supplementary lessons from the famous virtuoso, Teresa Carreño, that MacDowell's great musical gifts became manifest. Then, at the age of 15, the lad was taken abroad by his devoted mother for a thorough musical education. Entering the Paris Conservatory, young MacDowell studied for two years under the two eminent music masters Marmontel (piano) and Savard (theory and composition). Going next to Germany, he continued his musical studies at the Stuttgart and Frankfort conservatories, studying piano with Karl Heymann and composition with Joachim Raff, the well-known German composer. MacDowell's unusual talent so impressed both his German teachers that in 1881 they warmly recommended their American pupil for the university chair left vacant by Heymann's own resignation. Nothing but his extreme youthfulness (MacDowell was only 20 at the time) seems to have kept from him this much coveted Frankfort professorship. Failing of this, MacDowell accepted an instructorship at the Darmstadt Conservatory. But his duties as principal piano instructor there were so onerous and his compensation so inadequate that he soon had to resign from this position. Returning to Frankfort, MacDowell devoted himself to composition and private teaching.

It was there, at Frankfort, during his student days, that MacDowell's career as a composer really began. His 'First Modern Suite

for Piano' so impressed the great Liszt, whom MacDowell was induced by Raff to visit at Weimar in 1882, that he had it performed the same year at the Allgemeiner Deutscher Musikverein festival held at Zürich. A year later this suite and its successor, 'The Second Modern Suite,' were published by the famous Leipzig music publishers, Breitkopf and Härtel. Thus encouraged by his early success, and more especially by the sincere praise of Raff, Liszt and others, MacDowell resolved to settle in Germany permanently. And, save for a short visit to America in 1884 (when he married a former pupil of his, Marian Nevins), he did live there uninterruptedly for 12 years. In 1888 MacDowell returned to America and settled in Boston, which marks a turning point in his life. His European recognition, both as pianist and as composer, naturally had paved the way for his American successes. Almost immediately on his arrival MacDowell made his first public appearance in America in the double capacity of pianist and composer, performing one of his own compositions at a Kneisel Quartet concert (19 Nov. 1888). Shortly after he played his 'Second Piano Concerto' under Theodore Thomas at New York, winning such success with this composition and its performance that he soon repeated it with the Boston Symphony Orchestra. Thenceforth MacDowell's rise to fame was phenomenal. His services as pianist were in great demand — far greater than his virtuoso ambitions — while his orchestral compositions were performed almost as soon as they were written. Between 1890, when his symphonic poem, 'Lancelot and Elaine,' was performed by the Boston Symphony Orchestra, and 1896 when the same organization placed both his 'Indian Suite' and his 'Piano Concerto' on the same program — which was a most signal honor for a new composer — MacDowell's name appeared prominently and frequently on American orchestral programs. In 1891–92, too, he gave his first piano recitals which further enhanced his American fame. A couple of years later (14 Dec. 1894) MacDowell achieved unprecedented success by his performance, with the Philharmonic Society at New York, of his own 'Second Concerto for Piano and Orchestra.' By 1896, then, his name and fame as pianist and composer were fully established in America, if not also in Europe.

That year another important turning point in MacDowell's life was reached. Accepting the chair of music in the then newly-created music department at Columbia University, MacDowell plunged into teaching with such zeal and energy — devoting almost all his time and vitality to his arduous task — that eight years of it (1896–1904) was enough to undermine his health beyond repair. In 1905, one year after MacDowell had resigned his Columbia professorship (owing to a disagreement with the faculty as to the proper place of music in the college curriculum), alarming symptoms of a mental disorder appeared, which soon culminated in hopeless insanity. In this sad state MacDowell lingered till 23 Jan. 1908, when he died in New York, in his 47th year.

The list of MacDowell's compositions is a long one. His works extant (the composer himself, in a moment of ruthless self-criticism, destroyed a number of his compositions) include two suites for orchestra (the 'Indian Suites' Nos. 1 and 2), which are his most pretentious and best-known orchestral compositions; two concertos for piano and orchestra, which rank among the best of their kind; four sonatas for piano (the 'Norse,' the 'Keltic,' the 'Eroica' and the 'Tragica'), which alone would have made any composer famous; five symphonic poems ('Hamlet and Ophelia,' 'The Saracens,' 'Lamia,' 'Lovely Alda' and the 'Lancelot and Elaine,' already mentioned), which possess much originality and considerable melodic charm; two most delightful piano suites (the 'Woodland Sketches' and the 'Sea Pieces'), which contain some of MacDowell's most popular and fascinating shorter pieces, and numerous songs of charming simplicity and melodiousness.

As may be inferred from his musical titles, MacDowell is a romantic composer. His music is program music of the poetic, not the descriptive, kind; for MacDowell does not delineate objects, but rather the moods aroused by them. A pupil and disciple of Raff, MacDowell frequently gives his music the woodland flavor. Such titles as 'Forest Idyls,' 'New England Idyls' and 'Woodland Sketches,' among others too numerous to mention, clearly indicate that MacDowell is the Wordsworth of music. His lyrical pieces show the unmistakable influence of Grieg, whose music the American composer greatly admired; while as a romanticist he should be classed with Schumann and Mendelssohn. Consult Gilman, Lawrence, 'Edward MacDowell' (New York 1909), and Page, E. F., 'Edward MacDowell; His Work and Ideals' (ib. 1910).

McDOWELL, Ephraim ("FATHER OF OVARIOTOMY"), American surgeon: b. Rockbridge County, Va., 11 Nov. 1771; d. Danville, Ky., 20 June 1830. He studied medicine at Staunton, Va., and at the University of Edinburgh, then the most famous medical institution in the world. He established himself in practice at Danville, Ky., and became known throughout the Southern and Western States as the best surgeon in his part of the country. In 1809 he performed the hitherto unknown operation of extirpation of the ovary with complete success, and twice repeated the feat before he made an official report of the cases in 1816. His delay in reporting the first case and the seeming impossibility of the performance subjected him to considerable criticism in high quarters both at home and abroad. However, the fact of the success of the operation, several times repeated, is fully substantiated and the method he conceived and carried out has been but little modified, with the exception of asepsis and the use of anæsthetics. In lithotomy he had operated 22 times before 1828 without a fatality. Author of a report of his most famous cases in the *Eclectic Repertory and Analytic Review* (1817). Consult Gross, S. D., 'Origin of Ovariotomy' (1853); Jackson, J. B., 'Biographical Sketch of Ephraim McDowell' (1873); Letcher, J. H., 'Memoir of Ephraim McDowell' (1875).

McDOWELL, Irvin, American soldier: b. near Columbus, Ohio, 15 Oct. 1818; d. San Francisco, Cal., 5 May 1885. He studied at the College de Troyes, France, and was graduated at West Point in 1838. During the Canadian troubles he was stationed on the Niagara

and on the Maine frontiers, and in 1841 served at West Point as assistant instructor in tactics, becoming adjutant in 1845. In 1845 he went to Mexico as aide-de-camp to General Wood and for gallant conduct at Buena Vista in 1847 was promoted brevet captain, shortly afterward attaining the rank of assistant adjutant-general. Subsequently he was stationed at the War Department in Washington and in 1856 was raised to the rank of brevet major. He was on General Wood's staff at the outbreak of the Civil War and assisted in inspecting and organizing the volunteer troops at Washington. In May 1861 he was made brigadier-general of the volunteers and given command of the Army of the Potomac. Constrained by the impatience of the North, McDowell moved in July to meet the enemy and despite his carefully laid plan met a disastrous defeat at Bull Run, 21 July 1861, owing to the imperfect organization of his raw recruits. Shortly after McClellan was given command of the army and McDowell was retained at the head of one of its divisions. In 1862 he was promoted major-general of volunteers and placed in command of the First corps, which became the Army of the Rappahannock, stationed to guard Washington. In August 1862 he received command of the Third corps of the Army of Virginia and fought under General Pope at the battles of Cedar Mountain, Rappahannock Station and the second battle of Bull Run, where he performed especially good service. He was removed from the field in September 1862. Considering this action of the War Department a direct reflection upon his military services, he asked for an investigation, the result of which was favorable to him. From May to July 1863 he was president of a board appointed to investigate alleged cotton frauds, and during the following 10 months presided over the board for retiring disabled officers. In July 1864 he was placed in command of the Department of the Pacific Coast, and in March 1865 was made brevet major-general in recognition of his gallant services at Cedar Mountain. In 1872 he succeeded General Meade as major-general in the regular army and was in command of various military departments until 1882, when he was retired. The last years of his life were spent in California.

McDOWELL, James, American statesman: b. in Rockbridge County, Va., 1796; d. 1851. He was graduated at Princeton in 1817; in 1831 was elected to the Virginia legislature; was governor of that State, 1842–44, and from 1847 to 1851 represented it in Congress. He favored the gradual abolition of slavery, although advocating the claim of State rights. As orator and debater in Congress he bore a prominent part in the proceedings of that body leading up to the Compromise of 1850.

McDOWELL, William Fraser, American M. E. bishop: b. Millersburgh, Ohio, 4 Feb. 1858; d. 26 April 1937. He was educated at the Ohio Wesleyan and Boston universities and was ordained in the Methodist ministry in 1882. He held pastorates at Lodi, Oberlin and Tiffin, Ohio, and in 1890–99 he was chancellor of the University of Denver. He was corresponding secretary of the board of education of the Methodist Church in 1899–1904 and was elected bishop in 1904. He was Cole lecturer at Vanderbilt University in 1910, served as international commissioner of the Y. M. C. A. after 1899 and from 1906 was president of the board of trustees of Northwestern University. He made an official tour of India, China, Japan and the Philippines in 1910–11. Author of 'In the School of Christ' (1910); 'Good Ministers of Jesus' (1917); 'Making a Personal Faith' (1924).

MACDUFF, măk-dŭf', Scottish thane, or Earl of Fife, a half-mythical personage, commemorated in Shakespeare's play, 'Macbeth.' He is said to have been the principal agent in the overthrow of the usurper Macbeth and the restoration of Malcolm Canmore to the throne of Scotland. For this he was granted many privileges, among them that of a place of refuge to which he and his descendants could flee in case of committing unpremeditated murder. This sanctuary, in the form of a cross, stood till 1559, near Newburgh in Fife, in the pass leading to Strathearn. It was then demolished by the Reformers, but its pedestal yet remains.

McDUFFIE, măk-dŭf'i, **George,** American statesman and orator: b. in Columbia (now Warren) County, Ga., 1788; d. in Sumter District, S. C., 11 March 1851. He was graduated at South Carolina College in 1813, admitted to the bar in 1814 and in 1818 elected to the South Carolina legislature. From 1821 to 1834 he was a member of Congress, and from 1834 to 1836 governor of South Carolina. In 1843 he took his seat in the United States Senate, resigning on account of impaired health in 1846. In his political views and in his Congressional career, he was a close follower of J. C. Calhoun (q.v.), being at the outset a liberal constructionist in constitutional questions, but afterward becoming a strong opponent of the tariff and other economic policies of the government, and also a bold advocate of nullification. Although a supporter of Andrew Jackson (q.v.) in 1828, he became bitterly antagonistic to him, not only in respect to the tariff and State rights, but especially so on the question of the United States Bank, which, as chairman of the Committee on Ways and Means, he strongly defended against the hostile policy of the President. In 1832, as a member of the South Carolina Nullification Convention, he drafted the address of South Carolina to the people of the United States. He was one of the ablest orators of his day, and his prominence in public affairs was maintained in spite of an early wound received in a duel, from which he suffered for the remainder of his life.

MACÉ, Jean, zhŏn mä-sā, French educator and writer: b. Paris, France, 22 April 1815; d. there, 13 Dec. 1894. He was educated at the Collège Stanislas, served in the French army, 1842–45, was editor of *La République* in 1848 and as such was a strong supporter of the Revolution of that year. In 1851, on the *coup d'état,* he had to withdraw from Paris, and subsequently taught school in Alsace for 10 years. In 1866 he founded a league of instruction in the Belgian manner. He was decorated with the Legion of Honor in 1880, and elected senator in 1883. He was the author of many popular books for young people, the aim of which was mainly educational, among them his best-known work, 'Contes de petit-chateau' (1862), called in the English translation 'Home Fairy Tales'; 'History of a Mouthful of Bread' (1861);

'Servants of the Stomach' (1866); 'France Before the Franks' (1881).

MACE (Lat. *macir*, Greek *μάκερ*, an East Indian spice), an aromatic spice made from the arillode or false aril which covers the seed of a nutmeg (*Myristica fragrans*). The yellow external covering of the nutmeg (q.v.) being removed, the red, rather fleshy, arillode which partially conceals the nutmeg is encountered. After drying in the sun for several days this becomes more or less translucent and usually orange yellow and waxy. In this form it is largely exported from the Spice Islands, where it is native, and from the West Indies, where it has been introduced into cultivation. The powerful but agreeable nutmeg-like odor and flavor characteristic of it are due to a volatile oil which is obtained by distillation for use in perfumery and culinary articles. A buttery fixed oil obtained by expression is used after the admixture of the volatile oil under the names nutmeg balsam and nutmeg butter. White mace is obtained from *M. otoba* and red mace from *M. tingens;* also a low grade from *M. fatua,* but this is rarely found in the market. Mace is also largely used whole or ground in cookery.

MACE, a weapon of war formerly in use in Europe, chiefly among the cavalry, as late as the 16th century, and still used among savage tribes. It consists merely of a staff about five feet long, with a knob at the end. In England the mace is used as an emblem of the officers of state, before whom it is carried. It is made of the precious metals, or of copper, gilt and ornamented. A mace is also carried by the Sergeant-in-Arms of the House of Representatives and it is placed to the right of the Speaker.

MACEDO, Joaquim Manoel de, hō-ä-kēn' mä'noo-el dā mä-sā'dō, Brazilian poet, novelist and statesman: b. Sao João d'Itaborahi, 24 June 1820; d. Rio de Janeiro, 11 April 1882. He studied medicine, but presently began to write and became professor of national history in the College of Dom Pedro at Rio de Janeiro. He was one of the most prominent of Brazilian authors in the 19th century, and being keenly interested in politics was elected to the Brazilian Chamber in 1854. His works include 'Moreninha,' a novel (1844; 5th ed., revised, 1877); 'O Moço Louro,' a novel of the early stages of the Portuguese conquest (1845); 'O Dous Amores' (1848); 'Vicentina' (1853); 'A Nebulosa,' a poem (1857), his greatest work, consisting of six cantos in unrhymed hendecasyllables; 'Cobé,' a drama; 'Fantasma Branco,' a comedy (1856); 'Nociones de cronografía do Brasil' (1873; translated into French by Halbout), etc.

MACEDO, José Agostinho de Padre, Portuguese poet and author: b. Beja, 1761; d. 1831. He received his education in Latin and rhetoric under the Oratorians at Lisbon and became a member of the Augustinian Order in 1778. Temperamentally unfitted for a monastic life he failed to conform to the discipline of the order and in consequence was imprisoned in one convent or another the greater share of the time. He eventually abandoned the monastery and his subsequent excesses caused him to be unfrocked in 1792. Intercession on the part of influential friends, however, secured for him a papal brief which secularized him but restored his ecclesiastical status. He then entered journalism and his preaching gained for him a foremost position among the orators of his day. In 1802 he was appointed a court preacher. He established and contributed to a large number of journals and was famous for his keen satire and wit, although he also gained the reputation of being the "chief libeller of Portugal." He was a staunch adherent of absolutism and seriously advocated the massacre of all opponents of Miguel. He was censor of books in 1824–29, when he resigned upon being threatened with proceedings by his own political party, his support having become harmful to its interests. He had gained a considerable reputation through his verse, which introduced into Portugal didactic and descriptive poetry, and his 'Meditation' (1813) was a notable production. His ambition then led him to covet the place held by Camoens as Portugal's leading poet, and in 1814 he published 'Oriente', for which he unwisely chose the subject of Camoens' 'Lusiads,' the discovery by Gama of the sea route to India. While the verse itself was not without strength and grace the epic, as a whole, was flat and insipid, and failed utterly to cause its author to outshine Camoens. Macedo then published his 'Censura dos Lusiados,' in which he bitterly attacked Camoens, and brought upon himself Bocage's scathing 'Pena de Talião.' His 'Os Burros' is no less pitiless in its betrayal of his own evil character than shameless in its excoriation of men and women in all grades of society, living or dead. He translated the 'Odes' of Horace and made several attempts at drama but these are not particularly notable. He was at his best in his odes to Wellington and to Alexander, and in the verse in his 'Lyra anacreontica.' There is some doubt concerning 'A Demonstration of the Existence of God' as being from his pen, but it is usually credited to him and shows high ability. He was notorious for his ingratitude, and merciless in his satire, but he died with many friends and a great reputation, although his fame was of brief duration. Consult T. Braga's edition of 'Memorias para la vida intima de José Agostinho de Macedo' (1899); 'Cartas e opusculos' (1900).

MACEDONIA, măs-ē-dō'nĭ-ȧ, a territory in the Balkan Peninsula (q.v.). Never having had a separate existence as a political or administrative unit in modern times, it has no precisely defined boundaries. The territory generally considered to be within Macedonia (approximately 25,000 square miles) is bounded on the east by the Mesta River and the Rhodope Mountains, on the north by the Rila Mountains and the Crna Gora, on the west by the Shar Mountains and the Ohrid-Prespa lake district, and in the south by the Vistritsa (Haliakmon) River and the Aegean Sea. It is a mountainous area except in its southern and eastern sectors, which are the most productive agricultural lands in modern Greece. The strategic significance of Macedonia has been great throughout the course of history, for it is crossed by two major European trade routes which link the Aegean Sea with central Europe and with the Adriatic. These routes meet near the mouth of the Vardar River at the port of Salonika (Thessalonike)

the only large city in Macedonia. It is the natural commercial port for the trade of a large part of the Balkan Peninsula. In the low-lying areas of eastern and southern Macedonia near Salonika the chief crops are cereals and tobacco, of which a considerable surplus is produced for consumption outside Macedonia. In the northern and western parts the climate and the economy are like those of the neighboring areas of the central Balkan Peninsula; crop yields, principally cereals, are low and living standards are near the subsistence level.

In ancient times Macedonia was a monarchy which had its beginnings in the coastal area at the head of the Thermaic Gulf, now the Gulf of Salonika (Thermaikos). King Philip II of Macedonia in the 4th century B.C. extended his kingdom to include all the territory now known as Macedonia, including the Peninsula of Chalcidice (Khalkidike). The district which he conquered from Thrace, lying between the Strymon (Struma) and the Nestos (Mesta) rivers was called *Macedonia adjecta*. Under Philip and his son, Alexander the Great, Macedonia conquered all of Greece and then the greater part of the civilized world. After Alexander's death in 323 B.C., the immense Macedonian Empire was divided; in 197 B.C., after a resounding defeat in battle by the Romans, Macedonia lost even its dominion over Greece and returned to its ancient limits. After further military defeats it became a Roman province in 146 B.C. As such it is mentioned in the New Testament, and Saint Paul's letters to the Thessalonians and Philippians are addressed to Macedonian Christians. In 395 A.D. Rome lost possession of Macedonia and it became a part of the Byzantine Empire, which held it, except for intervals when it fell under the control of the Bulgars and the Serbs, until the conquering Ottoman Turks wrested it from the feeble Byzantine emperors in the 14th and 15th centuries.

The earliest known inhabitants of Macedonia stemmed from two major groups, the Thracians and Illyrians, apparently with a large admixture of Dorians. Migrations during the course of the Middle Ages completely changed the character of the population. By the time of the Turkish conquest the original inhabitants had been pushed out or absorbed by the masses of Slavs who settled in Macedonia. The province had become predominantly Slavic except in the coastal area where Greeks had established themselves. These two groups have remained the basic elements in the population. Minor elements which setttled there at various times and are there today include the Albanians, who filtered into Macedonia from the west; Kutzo-Vlachs, who speak a dialect of Rumanian and are principally a shepherd people; Turks, who formed the privileged class during the period of Ottoman rule and owned much of the land; gypsies; and Spanish-speaking Jews, concentrated in Salonika, whose forbears found refuge in the tolerant Ottoman Empire after their expulsion from Spain. Although the number of nationalities present in Macedonia has added to the complexities of the Macedonian «problem,» the basic factors in it have been the antagonism between Slavs and Greeks and the dispute between Serbs and Bulgarians over the Macedonian Slavs. Until the rise of nationalism in the 19th century these conflicts did not arise in acute form. Then, however, Serbian, Bulgarian, and Greek nationalists began to stake out conflicting claims to Turkish territory. The Macedonian Slavs, claimed as blood brothers by both Serbs and Bulgarians, numbered approximately 1,150,000, about one half the total population of Macedonia. In language they were neither Serbs nor Bulgarians but were closely related to both. By 1870, however, their linguistic and cultural ties were much closer with Bulgaria, which like Macedonia was still under Turkish administration, than with Serbia, which enjoyed political autonomy. In that year the Bulgarians secured the establishment at Constantinople of an autonomous Bulgarian Orthodox Church, or Exarchate, the jurisdiction of which extended to Macedonia. The treaty of San Stefano, which was forced on defeated Turkey by Russia in 1878, provided for the inclusion of Macedonia within the boundaries of an autonomous Bulgarian principality. The Treaty of Berlin in the same year revised that settlement and left Macedonia under direct Turkish rule with a promise of reforms which were to improve the lot of the population. Since that time Bulgaria has regarded Macedonia as lost national territory which must be regained. During the decades following the Treaty of Berlin the Turkish administration in Macedonia went from bad to worse, and the neighboring states (Bulgaria, Serbia, and Greece) engaged in bitter rivalry to win the allegiance of the Macedonian population by propaganda and by more violent methods. In 1893 the Internal Macedonian Revolutionary Organization (I.M.R.O.) was founded at Resan in Macedonia with a program of independence. Shortly afterward a Supreme Macedonian Committee was formed in Bulgaria with a program of liberating Macedonia from the Turks and annexing it to Bulgaria. These organizations hoped that the disorder they were helping to create in Macedonia would provoke Turkish reprisals against the population and thus would force the European powers to intervene. In 1902–03 a widespread insurrection broke out and was brutally crushed by the Turks. Thereupon Russia and Austria, the two great powers most directly interested, drew up a scheme of reforms (1903) which Turkey was forced to accept. It provided for the inspection and supervision of certain aspects of the administration by representatives of the European powers. This scheme never functioned efficiently, partly because the neighboring Balkan States, desirous of a more drastic solution of the problem, did not intend that it should. In 1912 they formed a military alliance and attacked Turkey with the aim of eliminating the Ottoman power from the soil of Europe. In this they were nearly successful; they defeated the Turkish armies, overran Macedonia, Albania, and a part of Thrace, but could not agree over the division of the Macedonian spoils. The Greeks, who had occupied Salonika, and the Serbs, who had taken over most of the remainder of Macedonia, joined to defeat the Bulgarians in the Second Balkan War in 1913 and divided the disputed territory between themselves, leaving only a small corner of it to Bulgaria. This settlement was confirmed by the Treaty of Bucharest (1913). (See BALKAN LEAGUE; BALKAN WARS.) Bulgaria's entry into the First World War in 1915 on the side of the Central Powers was in part motivated by the desire to acquire Macedonia. When the Serbian Army was driven to the Adriatic coast in that

same year, the Bulgarians occupied Serbia's share of Macedonia and held it until the victory of the Allies in 1918. The Salonika front was the scene of the great Allied breakthrough which knocked Bulgaria out of the war and made untenable Germany's entire position in the southeast. The territorial settlement of 1919 restored, with some slight modifications, that of 1913. Yugoslavia and Greece were confirmed in possession of all of Macedonia except the Petrich district which remained in Bulgaria. During the 1920's, as a result of exchanges of populations between Greece and Turkey and between Greece and Bulgaria, Greek Macedonia became over 90 per cent Greek in population. It presented a far less acute problem than Yugoslav Macedonia which contained over 650,000 Slav inhabitants whom Bulgaria claimed as Bulgarians but whom Yugoslavia officially designated as «South Serbians.» Severe treatment of this population by the Yugoslav government, coupled with terroristic outrages and the violation of the frontier on the part of bands organized on Bulgarian soil, made normal relations between the two countries very difficult. In Macedonia itself there were partisans of Bulgaria, of Yugoslavia, and of the idea of an independent Macedonia which had persisted since the early days of revolutionary activity against the Turks. Some of the tension was removed from the Macedonian question after the Bulgarian government broke up the terroristic Macedonian organization in Bulgaria in 1934 and signed a treaty of friendship with Yugoslavia in 1937. However, Bulgaria did not hesitate to occupy Yugoslav Macedonia when Germany crushed the Yugoslav Army in 1941 and to treat it as liberated Bulgarian territory. At the same time Bulgaria occupied the eastern part of Greek Macedonia between the Struma and Mesta rivers and began to resettle Bulgarians there. Having made these territorial gains with German aid, Bulgaria was reluctant to give them up and remained loyal to its alliance with Germany long after German military fortunes began to decline, partly because it saw no chance at all to maintain the new «Greater Bulgaria» in the event of a United Nations victory.

JOHN C. CAMPBELL,
Formerly on the Research Staff of the Council on Foreign Relations.

MACEDONIAN, The. See UNITED STATES AND MACEDONIAN, BATTLE OF.

MACEDONIANS, followers of Macedonius, author of the Macedonia heresy; also called Pneumatomachi, or «Adversaries of the Spirit.» The Macedonians came into existence toward the decline of the Arian controversy, when Macedonius became patriarch of Constantinople (341), and taught that the Holy Ghost was «subordinate to the Father and to the Son, unlike to them in substance, and a creature.» He was a semi-Arian; was deposed by the Arians in 360; and his special tenets condemned at the Council of Constantinople in 381. In that council the clauses defining the nature of the Holy Ghost were added to the Nicene Creed.

MACEIÓ, mä-sā-yō', Brazil, formerly MAÇAYO, city and capital of the state of Alagôas, on the Atlantic Coast, 135 miles southwest of Pernambuco. The city has a cathedral, lyceum, government and other buildings. It has manufactures of machinery and cotton goods, and considerable ship-building is carried on here. Cotton, sugar and rum are the chief items of export. Maceió is the seat of a United States consular agent. Pop. 129,000.

McENTEE, Jervis, American painter: b. Rondout, N.Y., 14 July 1828; d. there 27 Jan. 1891. He made his first contribution to the American Academy of Design in 1853, was elected associate of that institution in 1860 and academician in 1861. He belonged to the «Hudson River School» of artists and his favorite subject was the autumn type of landscape, although his work is by no means confined to one phase or season. Among his paintings are *The Melancholy Days Have Come* (1860); *Sea From Shore* (1873); *Old Mill in Winter* (1874); *Clouds* (1879); *Glimpse of Hunter Mountain* (1886); *A Cliff in the Catskills* (1888). His *Autumn Landscape* hangs in the Metropolitan Museum, New York.

MACEO, mä-sā'ō, **Antonio,** Cuban patriot: b. Santiago de Cuba, 14 July 1848; d. near Mariel, 2 Dec. 1896. He joined the insurgent army as a private in 1868, and his natural military ability and personal magnetism as a leader soon brought him to the front, making him second only to Gomez. Under his skillful leadership Martinez Campos was defeated at Demajayabo and at La Galleta; his campaign in Baracoa in 1878 evidenced masterly generalship, as did also his utter rout of Santacledes at San Ulpiano. Maceo alone of all the Cuban generals refused to sign the Peace of Zanjón and made a tour of the United States and other countries in America seeking support for the cause of Cuban independence. He was the first of the Cuban leaders to land in 1895, and his achievements in the campaign are among the most brilliant feats in the history of Cuba's long struggle for independence. While crossing the trocha between Majana and Mariel, attended only by his staff, he was surrounded by a Spanish force and killed.

MACEO, José, hō-sā, Rafael, Cuban patriot: b. Santiago de Cuba, 1846; d. La Loma del Gato, Cuba, 5 July 1896. He was a brother of Antonio Maceo (q.v.) and took a conspicuous part in the Rebellion of 1868–78. He remained in Santiago de Cuba after the Peace of Zanjón, which he with his brother refused to sign. He lived in Costa Rica from 1885 until the outbreak of the rebellion in Cuba in 1895, when he raised a large force which he commanded with signal success. He was killed in a furious engagement at La Loma del Gato in which the Cubans were finally victorious. For an adequate account of the importance of the Maceo brothers consult General Weyler's *Mi Mando en Cuba, 10 Febrero 1896 a 31 Octubre 1897* (5 vols., Madrid 1910–11).

MACERATA, mä-chā-rä'tä, central Italy, an episcopal city, capital of the province of the same name, picturesquely situated on an eminence, 1,207 feet high, between the Apennines and the sea, 21 miles south of Ancona. It is encircled by walls, pierced by six gates, has a cathedral, provincial palace and theatre on the central public square, town-hall (13th century), a college founded in 1290, museum, etc. Terra cotta, chemicals and matches are among its manufactures. Pop. of commune

(1943) 26,708. The province is watered by the Chienti and Potenza rivers which flow eastward into the Adriatic. The coastline, lying chiefly between the mouths of these two rivers, is about 12 miles long. The province is mountainous in the west; the rest is hilly, except for flat strips along the rivers and the coast. The raising of grains, grapes and livestock are the chief activities. Area 1,071 square miles; pop. (1947 est.) 303,000.

MacEWEN, măk-ū'ĕn, **Walter,** American artist: b. Chicago, Feb. 13, 1860; d. New York, March 20, 1943. He studied under Cormon and Tony Robert-Fleury in Paris, and lived much abroad. His work includes landscapes, portraits, decorative panels and figure subjects, and is marked by excellent sense of line and strong feeling for color. He executed panels for the Liberal Arts Building at the Columbian Exposition, Chicago, and for the Congressional Library, Washington, and many of his paintings have been acquired by public galleries. Among them are *Sunday in Holland* (in the Luxembourg Museum, Paris), *An Ancestor* (Corcoran Gallery, Washington), and *Judgment of Paris* (Art Institute, Chicago).

MACEWEN, măk-ū'ĕn, Sir **William,** Scottish surgeon: b. Rothesay, June 22, 1848; d. Glasgow, March 22, 1924. He was educated at Glasgow University, and became regius professor of surgery there in 1892; president of the British Medical Association in 1922; knighted, 1902. He was noted as a pioneer in the surgery of the brain and spinal cord and in the field of bone grafting. Among his works are *Osteotomy* (1880); *Atlas of Head Sections* (1893); *Pyogenic Diseases of the Brain and Spinal Cord* (1893); and *The Growth of Bone* (1912).

McFARLAND, măk-fär'lănd, **John Horace,** American master printer and horticulturist: b. McAlisterville, Pa., Sept. 24, 1859; d. Harrisburg, Pa., Oct. 2, 1948. He was privately educated, learned the printing business and in 1878 established his own firm, which after several changes was incorporated as the J. Horace McFarland Company in 1891. He was an active member of various leagues for improving and beautifying American cities and towns, and an ardent advocate of national parks and forest conservation. Besides the many periodicals which he printed, illustrated, or wrote for, he was editor of *The American Rose Annual* from 1916 to 1943, and author of *Photographing Flowers and Trees* (1902); *Laying out the Home Grounds* (1915); *My Growing Garden* (1915); *The Rose in America* (1923); and *Roses of the World in Color* (1936).

MACFARREN, Sir **George Alexander,** English composer: b. London, March, 2, 1813; d. there, Oct. 31, 1887. He was educated at the Royal Academy of Music, where in 1837 he became a professor of harmony and composition and in 1875 principal. In the same year he was elected professor of music in Cambridge University. Among his compositions are the operas *The Devil's Opera* (1838), *Robin Hood* (1860), and the oratorios *St. John the Baptist* (1873) and *King David* (1883). He also wrote several treatises, among them *Harmony* (1860) and *Counterpoint* (1879). He was knighted in 1883. In 1860 he became blind, and his wife thereafter wrote his compositions from his dictation.

MAC FLECKNOE, or A SATYR UPON THE TRUE-BLEW-PROTESTANT POET, T. S., a satire by John Dryden (q.v.), published in 1682 to ridicule Thomas Shadwell, who later replaced him as poet laureate (1689). Dryden here introduced the name of Richard Flecknoe (1600–?1678), who by the author is represented as an Irish priest famed for his dull verse, but who is described by Andrew Marvell as "an English priest at Rome." Flecknoe was disliked by Dryden because of the former's abuse of actors and his attacks on their morality or rather absence of it. The name served also as a stalking-horse from behind which Shadwell might be pilloried as the "adopted" son (Gaelic *Mac*) and heir of Flecknoe. The satire served Pope as model for his *Dunciad.* The authorship of *Mac Flecknoe,* long disputed and attributed to Dryden, was called in question in 1918 when there appeared a possibility that it might have been written by John Oldham, Dryden's friend. A manuscript of the latter's poems in the Bodleian Library contains *Mac Flecknoe,* but Dryden claimed authorship of the piece and his friend Oldham never did.

MacGAHAN, mà-găn', **Januarius Aloysius,** American journalist: b. near New Lexington, Ohio, June 12, 1844; d. Istanbul, June 9, 1878. He followed different callings in Western states, then went to Europe and studied law in Brussels. Upon the outbreak of the Franco-Prussian War in 1870 he went to the field as correspondent of the New York *Herald,* and was with Bourbaki's army. He visited Bordeaux and Lyon and his interviews with clerical, monarchical and republican leaders attracted wide attention. He was the only newspaper correspondent in Paris during the whole period of the Commune and narrowly escaped death. In 1873, after heroic exertions, with extreme hardships, he reached the Russian army before Khiva, and sent to the *Herald* reports of the campaign which won for him high admiration both at home and in Europe, his account of the capitulation of the city being regarded as a masterpiece of military journalism. Returning to America, he went to Cuba to report on the *Virginius* affair, then to Spain, upon the Carlist uprising, where he spent 10 months with the army of Don Carlos, was captured by the Republicans, mistaken for a Carlist, condemned to death and saved by the intervention of the United States minister. He then went to England, and in 1875 accompanied the Arctic expedition on the *Pandora.* In 1876 he joined the Turkish Army, in the service of the London *Daily News,* and did memorable work in his description of the Bulgarian atrocities, his accounts standing approved before the world in face of all attempts to discredit them. On behalf of Bulgaria he appealed to Russia, was at the front in the Russo-Turkish War that followed, and was hailed as a chief instrument of Bulgaria's resulting independence. While nursing his friend Lieut. Francis V. Greene he contracted typhus which in a few days caused his death. In 1884 the Ohio legislature secured the removal of his body from its foreign grave to its final resting place at New Lexington. He wrote *Campaigning on the Oxus, and the Fall of Khiva* (1874); *Under the Northern Lights*

(1876), and *Turkish Atrocities in Bulgaria* (1876).

McGEE, mȧ-gē′, **Thomas D'Arcy,** Irish-Canadian journalist and statesman: b. Carlingford, Ireland, April 13, 1825; d. Ottawa, Ontario, April 7, 1868. In 1842 he emigrated to the United States, but having attracted the notice of Daniel O'Connell, he went to London as a correspondent of the *Freeman's Journal* and, later, the *Nation,* an organ of the Young Ireland party. The failure of the revolt of his party caused him to seek refuge in the United States in 1848. McGee then founded and edited the New York *Nation* and, soon after, the *American Celt* at Boston. In 1857, however, having become converted to constitutional methods for the redress of Irish grievances, he went to Montreal where he edited *The New Era,* advocating the creation of a Canadian nation. He entered Parliament in 1857; was president of the council, 1862–1863; and minister of agriculture, 1864–1868; living to see the confederation which his eloquence and persuasiveness had done much to popularize. His opposition to the extremists of the Fenian Brotherhood is believed to have been the cause of his assassination. Among his works are *A History of the Irish Settlers in North America* (1851); *Speeches and Addresses, Chiefly on the Subject of the British American Union* (1865); and *A Popular History of Ireland,* 3 vols. (1862–1869).

McGEE, William John, American scientist: b. near Farley, Iowa, April 17, 1853; d. Washington, D.C., Sept. 4, 1912. He was self-educated, and from 1873 to 1875 surveyed land and practised in the courts. He also improved several agricultural implements, some of which he patented. In 1877–1881 he made geologic and topographic surveys of northeastern Iowa, and for the United States Geological Survey he surveyed and mapped 300,000 square miles in the southeastern part of the country, and performed many other important services in the departments of geology, ethnology and anthropology. From 1893 to 1903 he was ethnologist in charge of the Bureau of American Ethnology. He was president of the American Anthropological Association, chief of the Department of Anthropology and Ethnology of the Louisiana Purchase Exposition and associate editor of the *National Geographic Magazine.* He wrote *Geology of Chesapeake Bay* (1888); *Pleistocene History of Northeastern Iowa* (1891); *The Lafayette Formation* (1891); *Potable Waters of the Eastern United States* (1894); *The Siouan Indians* (1897); *Primitive Trephining in Peru* (1897); *The Seri Indians* (1898); *Primitive Numbers* (1900); *Soil Erosion* (1911); *Wells and Subsoil Water* (1913), and many scientific memoirs.

McGIFFERT, mȧ-gĭf′ẽrt, **Arthur Cushman,** American theologian: b. Sauquoit, N. Y., March 4, 1861; d. Dobbs Ferry, N. Y., Feb. 25, 1933. He was graduated at the Western Reserve College in 1882, and at Union Theological Seminary in 1885, and continued his studies at the universities of Berlin and Marburg, Germany, and in France and Italy. In 1888–1890 he was instructor in church history at Lane Theological Seminary, Cincinnati, and professor there 1890–1893, in 1893–1927 he was professor of church history and in 1917–1926 president of Union Theological Seminary, New York. In 1897 he published *A History of Christianity in the Apostolic Age,* and because of criticism and threatened denominational disturbance, involving his possible trial for heresy, to which this book gave rise, he withdrew from the Presbyterian ministry, and later, while still retaining his professorship, joined the Congregational Church. His other publications include *Dialogue Between a Christian and a Jew* (doctor's thesis, 1888), and a translation of Eusebius' *Church History,* with prolegomena and notes (1890); *The Apostles' Creed* (1902); *Protestant Thought Before Kant* (1911); *Martin Luther, the Man and his Work* (1911); *The Rise of Modern Religious Ideas* (1915); *The God of the Early Christians* (1924); *A History of Christian Thought,* 2 vols. (1931–1932).

McGIFFIN, mȧ-gĭf′ĭn, **Philo Norton,** American naval officer: b. Washington County, Pa., Dec. 13, 1860; d. New York, Feb. 11, 1897. He was graduated in 1882 at the United States Naval Academy and was stationed in China, and at the outbreak of the war between China and France was permitted to resign from the United States Navy to enter the service of China. He established a naval academy at Weihaiwei, of which he had charge. When the Sino-Japanese War broke out he was placed in command of the *Chen Yuen,* and was the first American or European to command a modern warship in action. He was in command at the Battle of Yalu River, Sept. 17, 1894, in which action he was so severely injured that he afterward shot himself at a hospital in New York.

McGILL, mȧ-gĭl′, **James,** Canadian philanthropist: b. Glasgow, Scotland, Oct. 6, 1744; d. Montreal, Dec. 12, 1813. He was educated in Glasgow and in 1770 moved to Canada, where he engaged in the northwest fur trade, afterward becoming a merchant in Montreal. McGill was a member of the Parliament of Lower Canada and held the rank of brigadier general in the War of 1812. He used much of his wealth in philanthropic work and at his death founded McGill University (q.v.) in Montreal.

McGILL UNIVERSITY, Montreal, Canada, founded through a bequest of the Honorable James McGill, a leading merchant and prominent citizen of Montreal who died in 1813 and in his will left money for a university "for the purpose of education and advancement of learning." In 1821 the university was established, by a royal charter granted by the crown of the United Kingdom, and to this day the governor general of Canada is ex officio the visitor of the university.

The McGill campus is situated in the heart of the great Canadian metropolis, with a compact group of buildings housing the various faculties and schools, the stadium, gymnasium-armory-swimming pool, libraries, laboratories and research institutes, and the adjacent Royal Victoria Hospital, one of the teaching hospitals of the university. Its first building was erected on the land given by James McGill which was a farm on the outskirts of the city, but in the intervening century and a half the city grew up around the university property, so that in 1950 the value of the buildings and grounds was close

to $50,000,000. However, Macdonald College, on a separate campus twenty miles from Montreal, houses the faculty of agriculture, the school of household science and the school for teachers, and was provided and generously endowed in 1907 by another leading merchant and philanthropist of Montreal, Sir William Macdonald. This part of the university is a residential college which houses more than 800 students.

The campus in Montreal comprises Douglas Hall and Wilson Hall, men's residences, and the Royal Victoria College for women students. Actually, however, only a small proportion of the students of the university live in residence, the majority finding homes in the city.

Many generous benefactors have made possible the great development of this Canadian university, one of the few privately endowed institutions. Situated in the French Canadian Province of Quebec, it has not received any large measure of financial support from the provincial government.

In recent times, principals of McGill University have included Gen. Sir Arthur Currie, G.C.M.G., K.C.B., who had been the commander of the Canadian Army Corps in Europe in World War I, and who served as principal from 1920 to 1933; Mr. Lewis Williams Douglas, later American Ambassador at London, England, who served from 1937 to 1939, and Dr. F. Cyril James, a native of London, England, who was a professor in the Wharton School of Finance and Commerce at the University of Pennsylvania. Dr. James became principal of McGill University in 1940.

On the battlefields in the two world wars students and staff of the university made a notable contribution. There were 6,500 on active service, 272 were killed or died, 618 received military decorations, and 359 served with the United States Army and 151 in the United States Navy.

The faculties embrace arts and science, law, music, divinity, agriculture, medicine, dentistry, engineering; there are schools of commerce, architecture, physical education, social work, graduate nursing, physiotherapy and the library school. Between 1930 and 1950 the faculty of graduate studies and research saw its enrollment of students increase from 100 to over 700, many coming to this center of higher studies from the United States and other parts of the world. The faculty of medicine is known all over the world and receives over 2,000 applications each year from students who wish to pursue their medical studies at McGill, but the annual admissions are restricted to 100, owing to the shortage of the facilities for clinical teaching. Sir William Osler was for some years a professor at McGill, and the magnificent Osler Library in the Medical Building is presided over by his nephew, Dr. W. W. Francis. The three teaching hospitals of the university comprise the Royal Victoria Hospital, the Montreal General Hospital and the Children's Memorial Hospital.

The Neurological Institute which houses the university department of neurology and neurosurgery was founded in 1933 with financial assistance from the Rockefeller Foundation and has become a recognized world center for the study of brain and diseases of the nervous system. The Allan Memorial Institute of Psychiatry was similarly founded through a generous grant from the Rockefeller Foundation and provides for the study, treatment, and cure of psychiatric ailments. The Pathological Institute houses the departments of pathology and bacteriology. The faculty of engineering, which has sent its graduates into all corners of the earth, has about 1,500 students in the courses leading to degrees in various branches of engineering and in architecture. The Institute for Pulp and Paper Research, which is also on the McGill campus, is a joint undertaking of the federal government, the pulp and paper industry of Canada, and the university.

In many of its scientific departments McGill University is prominent. The laboratories of the departments of chemistry and physics occupy a high place, and played a significant role in wartime problems. Among the discoveries was the production of RDX, an explosive more powerful than TNT. The only cyclotron and radiation laboratory in Canada is at McGill, and a large corps of research workers engage on problems of nuclear physics. The Eaton Electronics Laboratory was opened in October 1950.

Important studies of the medical and biological departments during World War II included blood storage, the treatment of shock, the cure of motion sickness in aviation and, in the agricultural departments, many problems of nutrition, human and animal, are being solved.

The athletics facilities include the Percival Molson Stadium which has been enlarged to accommodate 23,000, and the Sir Arthur Currie Memorial Gymnasium-Armoury and War Memorial Hall and Swimming Pool.

The adult education program of the university embraces accountancy diploma courses, summer schools in French and geography and, for teachers, extension lectures, and a comprehensive program for rural adult education which began with the support of the Carnegie Corporation about 1930 and has become self-supporting.

To accommodate the record enrollment of students after the close of World War II, the university took over two former air force stations, one at Lachine, Que. and one at St. Johns, Que. Dawson College, as it became known, at St. Johns, at the height of its activity housed over 1,800 students and provided there complete courses of instruction and laboratories in the subjects of the first and second years of science, commerce and engineering, the regular university staff making the daily journey from nearby Montreal to give lectures there as well as on the Montreal campus. Owing to the graduations of veterans and the prospect of a return to normal numbers these two residences were closed by the university at the end of the 1949–1950 session.

Before the outbreak of World War II in 1939 McGill University enrolled approximately 3,000 students in the full-time courses leading to degrees and diplomas, but during the postwar era its registration increased to 8,500, half of whom were veterans who had returned from active service to academic studies under the government plan of subsidizing their education. In 1950 the enrollment was approximately 7,500 and there were only about 1,000 veterans left.

MACGILLICUDDY'S REEKS, mă-gĭl'ĭ-kŭd-ĭz rēks, mountain range, Ireland, located in County Kerry, extending for 13½ miles from the Lakes of Killarney on the east to Lough Carra on the west, and covering an area of 28 square miles. It is the loftiest moun-

tain range in Ireland, culminating in Carrantuohill, 3,414 feet high.

McGILLIVRAY, mȧ-gĭl'ĭ-vrā, **Alexander,** chief of the Creek Indians: b. in Alabama about 1759; d. Pensacola, Fla., Feb. 17, 1793. His father was a Scottish merchant of good family and his mother a half-breed. He received a good education at Charleston, S. C.; was placed in a mercantile establishment in Savannah; but soon returned to the Creek country, where he became partner in a large trading house and rose to a high position among the Indians. After the death of his mother, a member of the ruling stock, he became chief of the Creeks, having received a call from a formal council, and styled himself Emperor of the Creek Nation. During the revolution the McGillivrays, father and son, were zealous adherents of the royal cause, the former holding the rank of a colonel in the British service. After the war Alexander McGillivray, in behalf of the Creek confederacy, entered into an alliance with Spain, of which government he was made a commissary, with the rank and pay of colonel. In 1790 he was induced by President Washington to visit New York, where he eventually signed a treaty yielding certain disputed lands lying on the Oconee. He was also persuaded to withdraw from Spanish service and was rewarded with an appointment as agent for the United States, with the rank and pay of brigadier general.

McGILVARY, Evander Bradley, American linguist and philosopher: b. Bangkok, Siam, July 19, 1864, of American parents. He was graduated from Davidson College in 1884 and from Princeton in 1888. From 1891 to 1894 he was translator for the Presbyterian Board of Foreign Missions in Siam, and in 1894 began graduate work at the University of California, where he later became assistant professor. In 1899 he was appointed Sage professor of ethics at Cornell. In 1905 he was appointed professor of philosophy at the University of Wisconsin. He has translated the Gospels of Matthew, Luke and John, and the Acts of the Apostles into the Lao dialect of Siamese.

McGLYNN, mȧ-glĭn', **Edward,** American Roman Catholic clergyman: b. New York, Sept. 27, 1837; d. Newburgh, N. Y., Jan. 7, 1900. He was educated at the College of the Propaganda in Rome, and from 1866 was pastor of Saint Stephen's Church in New York. He favored the education of children by the state rather than in parochial schools and in 1886 warmly supported the candidacy of Henry George for the mayoralty, thereby bringing upon himself the censure of the church for his political activities. He was summoned to Rome to exculpate himself, but refused to go, pleading his ill-health. Persisting in his refusal he was excommunicated in 1887. He was one of the founders of the Anti-Poverty Society and was its president. In 1893, after a hearing before the papal delegate, Monsignor Francesco Satolli, the ban of excommunication was removed, after the signing of a document drawn up by the apostolic delegate to the effect that his economic views were not in conflict with the Catholic faith. He was in charge of Saint Mary's parish in Newburgh at his death.

McGOVERN, mȧ-gŏv'ẽrn, **John,** American author: b. Troy, N. Y., Feb. 18, 1850; d. Dec. 17, 1917. He was connected for 16 years with the Chicago *Tribune,* and after 1880 was engaged in literary work and lecturing chiefly on great writers and historical characters. In the action of S. E. Gross, author of the play *The Merchant Prince of Cornville,* against Edmond Rostand, author of *Cyrano de Bergerac,* he acted as literary expert for the former. The United States Court at Chicago issued a decree in 1902 sustaining the claim of Gross to priority of authorship and forbidding the representation of *Cyrano de Bergerac* in this country. McGovern's numerous writings include *The Empire of Information* (1880); *King Darwin,* a novel (1894); *American Statesmen* (1898); *Famous Women of the World* (1898).

MacGRATH, mȧ-grȧth', **Harold,** American novelist and journalist: b. Sept. 4, 1871; d. Oct. 29, 1932. He was educated in Syracuse and in 1890 launched his career as a reporter on the Syracuse *Herald.* His first novel, *Arms and the Woman,* appeared in 1899 and was quickly followed by many other popular successes. He also contributed the early silent cinema serials *The Perils of Pauline* and *The Million Dollar Mystery.* Later he wrote a column for the Chicago *Evening Mail.* An editor of *The Reader* noted that MacGrath's novels "reflect his own enjoyment and mirror his own optimistic philosophy. . . . ." Among his novels are *The Man on the Box* (1904); *The Princess Elopes* (1905); *Enchantment* (1905); *Half a Rogue* (1906); *The Lure of the Mask* (1908); *The Goose Girl* (1909); *The Drums of Jeopardy* (1920); *The Cellini Plaque* (1925).

McGRATH, James Howard, American public official: b. Woonsocket, R. I., Nov. 28, 1903. He was appointed attorney general of the United States in August 1949. In 1929 he received the degree of bachelor of laws from Boston University. From 1934 to 1940 he served as United States district attorney. He was governor of Rhode Island from 1940 to 1945, and in 1946 he was elected to the United States Senate. He had been active in politics since 1928, when he was vice chairman of the Rhode Island Democratic State Committee. In October, 1947, he became chairman of the Democratic National Committee.

McGRATH, Patrick Thomas, British-American journalist: b. Saint John's, Newfoundland, Dec. 16, 1868; d. June 14, 1929. He was educated at the Christian Brothers' School, Saint John's, and in 1889 became a reporter on the Saint John's *Evening Herald.* He was promoted acting editor in 1893, and in 1894–1907 was editor. He established the *Evening Chronicle,* which in 1912 was united with the *Herald,* and became president of the company. He acted as Newfoundland correspondent of the London *Times* after 1904 and was an extensive contributor to both British and American periodicals. He was president of the Legislative Council of Newfoundland after 1915. He assisted in the preparation of the colony case concerning the French and American fisheries and was the colony's secretary on the occasion of the Dominion's Royal Commission visit to Newfoundland in 1914. He was honorary secretary of the Newfoundland Patriotic Fund, the Newfoundland Regiment Finance Committee and the Newfoundland War Pensions

Board after 1914; and chairman of the High-Cost-of-Living Commission after 1917. Author of 'From Ocean to Ocean' (1911); 'Newfoundland in 1911.'

McGREADY, mą-grā'dĭ, **James,** American Presbyterian clergyman: b. in Pennsylvania about 1760; d. 1817. He studied for the ministry in the school of John McMillan, of Cannonsburg, Pa., and in 1788 was licensed to preach. After some years of work in North Carolina, in 1796 he removed to southwestern Kentucky, and under his direction began the great revival of religion which culminated in 1800 and became memorable in the religious history of the country. He organized and conducted the first camp-meeting, and employed as preachers unordained young men without special theological training, thereby provoking dissension in the Presbyterian Church. Out of this disagreement arose the Cumberland Presbyterian Church (see PRESBYTERIAN CHURCH), organized in 1810. McGready, however, afterward became reconciled to the older Church and resumed his fellowship in it. Two volumes of his sermons were published years after his death, the first at Louisville, Ky., in 1831, the second at Nashville, Tenn., in 1833. Consult Davidson, 'History of the Presbyterian Church in the State of Kentucky' (New York 1847); Edson, 'Early Presbyterianism in Indiana' (1898); Foote, 'Sketches of North Carolina, Historical and Biographical' (New York 1850; 2d series, 1855); Smith, 'History of the Cumberland Presbyterian Church.'

MacGREGOR, măk-grĕg'ẽr, **John** ("Rob Roy"), Scottish traveler, writer and philanthropist: b. Gravesend, 24 Jan. 1825; d. Boscombe, 16 July 1892. He studied at Trinity College, Dublin, and was graduated from Trinity College, Cambridge, in 1847. He was called to the bar in 1851, but after a brief period in which he devoted himself to the law of patents he abandoned the profession and spent his time in travel and in works of philanthropy. He traveled in Europe, Egypt, Palestine, Russia, Algeria and America. He was deeply interested in the history and theory of marine propulsion and was largely instrumental in the introduction of canoeing into British sports. He constructed a canoe which he christened *Rob Roy,* and in which he made extended journeys. His books giving accounts of these expeditions were widely and deservedly popular. He was possessed of ample resources and gave liberally to philanthropic purposes. He sketched cleverly and illustrated his own books, and in early days occasionally contributed sketches to *Punch.* Besides numerous magazine articles he was author of 'Three Days in the East' (1850); 'Our Brothers and Cousins, A Tour in Canada' (1859); 'A Thousand Miles in the Rob Roy Canoe' (1866); 'The Rob Roy on the Baltic' (1867); 'The Rob Roy on the Jordan, Red Sea and Gennesareth' (1869), etc.

McGUFFEY, măk-gŭf'fẽ, **William Holmes,** American educator: b. Washington County, Pa., 23 Sept. 1800; d. Charlottesville, Va., 4 May 1873. He was graduated at Washington College, Pa., in 1826, was appointed professor of ancient languages at Miami University in that year, and in 1832 became professor of moral philosophy there. He was appointed president of Cincinnati College in 1836 and of Ohio University in 1839. He was professor of moral philosophy at Woodward College, Cincinnati, in 1843–45, and thereafter until his death he was professor of moral philosophy and political economy at the University of Virginia. He prepared the series of school reading- and spelling-books known under his name and for many years widely popular in the schools of the United States.

McGUIRE, mă-gwīr', **Hunter Holmes,** American surgeon: b. Winchester, Pa., 11 Oct. 1835; d. near Richmond, Va., 19 Sept. 1900. He was graduated from the Winchester Medical College in 1855, and from the Medical College of Virginia in 1858, studying also in the medical schools of New Orleans and Philadelphia. He was professor of anatomy at the Winchester Medical College in 1856–58 and afterward practised in Philadelphia. He enlisted in the Confederate army at the outbreak of the Civil War, became medical director of the Army of the Shenandoah Valley and later of the Second Army Corps. He was in attendance upon General "Stonewall" Jackson at the time of his death in 1863. In 1865–78 he was professor of surgery at the Virginia Medical College, Richmond. He organized Saint Luke's Home for the Sick in Richmond, with a training school for nurses. He was president of the American Medical Association in 1893.

MACH, mäh, **Ernst,** Austrian physicist and philosopher: b. Turas, Moravia, Austria, 18 Feb. 1838; d. 9 Feb. 1916. After a partly private secondary education he studied at the University of Vienna, taking his doctor's degree in physics in 1860. After spending several years as *privatdocent* he was appointed professor of mathematics at Gratz and in 1867 was called to the chair of physics at the University of Prague. Here he published in 1883 his first important work, 'Die Mechanik in ihrer Entwickelung historisch-kritisch dargestellt,' which has run through seven German and several English editions. Having turned his attention to the relation of physiological and physical processes, he next produced his equally epoch-making 'Analyse der Empfindungen' (1886; 6th ed., 1911). Owing to his increased interest in epistemological and historical problems, Mach gladly accepted in 1895 the offer of a philosophical chair at Vienna, where he read on the history and theory of the inductive sciences. The following year appeared his 'Principien der Wärmelehre,' while his university lectures ultimately took the shape of a substantial volume in 1905 under the caption 'Erkenntnis und Irrtum.' A paralytic stroke suffered in 1898 reduced the remainder of his life to a cripple's martyrdom, though it did not interfere with his mental activity. In spite of his liberal position in politics he was honored with the title of a court chancellor and was made a member of the upper chamber of the Austrian Parliament.

Mach's aim was to liberate science from metaphysical conceptions and thus he became in a sense a precursor of pragmatism. His general trend of thought exerted a profound influence on men like William James, Jacques Loeb, Karl Pearson and Wilhelm Ostwald, and his attempt to substitute the mathematical notion of function in place of the time-honored concept of causality has recently found an ad-

vocate in Bertrand Russell. His definition of science as an economical description rather than an explanation of the universe aroused considerable discussion in philosophical circles. Sympathetic insight, impartiality, a singularly sane judgment and an almost complete freedom from preconceptions render Mach an ideal historian. His principal works are accessible in English translations. For a brief exposition of his philosophy with biographical notes consult Carus, Paul "Professor Mach and his Work," in *The Monist,* January 1911, pp. 18-42.

MÁCHA, mä'kà, **Karl Hynek,** Czech poet: b. Prague, Nov. 10, 1810; d. Leitmeritz, Oct. 5, 1836. His style of poetry is full of sentiment and reflection, a forerunner of the present Czech school of poetry, strongly influenced by Byronic "Weltschmerz," i.e., the spirit bred by the realization of disharmony between ideals and concrete facts of reality. He studied in Vienna and Prague. Extreme poverty caused pulmonary trouble, from which he died after a lingering illness. His chief work, *Maj* (1836), is a lyrical epic. His historic tales, such as *The Gypsies,* etc., are in the style of Walter Scott. His collected works were published in Prague (1862).

MACHAERODUS, mā-kē'rō-dŭs, a genus of huge extinct cats, fossil in the Miocene and subsequent formations, and including the largest of the *Nimravidae.* See SABRE-TOOTHED TIGER.

MACHAERODONTINAE, mą-kē'rō-dŏn-tī'nī, an extinct subfamily of *Felidae,* including the sabre-toothed cats and their allies. This group became separated from the typical cats (*Felinae*) in the Oligocene epoch, and remained a numerous and powerful element of the carnivora of the world until the close of the Pleistocene. The general form and structure were catlike, and produced an equally effective armament, except, perhaps, in speed, for the limbs were shorter and heavier as a rule than in the feline cats of similar size, and the hind foot had five toes, instead of four. Another difference was in the comparative shortness of the tail. Mainly, however, the specialization of this subfamily was in the dentition, which differed from that of the cats in many particulars, and especially in the extraordinary development of the upper canines into huge stabbing-tusks, especially striking in *Smilodon,* one of the most modern and widely distributed American genera.

MACHAR, mą-kär', **Agnes Maule** (FIDELIS), Canadian author: b. Kingston, Ontario, about 1856; d. Jan. 24, 1927. She was educated at Kingston and at an early age her contributions began appearing in the magazines of Canada, England and the United States. She was author of a volume of verse, *Lays of the True North;* two historical works, *Memorials of Rev. Dr. Machar*—the author's father; *The Story of Old Kingston* (1908); *Stories of the British Empire* (1913); and the novels, *Katie Johnston's Cross; Lost and Won; Roland Graeme, Knight* (1892); and *The Heir of Fairmount Grange.*

McHENRY, James, American soldier, secretary of war, and signer of the Constitution: b. Ballymena, County Antrim, Ireland, Nov. 16, 1753; d. Baltimore, Md., May 3, 1816. An Ulsterman, McHenry received a classical education in Dublin, and in 1771 emigrated to Philadelphia, the rest of his family joining him a year later. His father and brother founded an importing business in Baltimore; it prospered and eventually (1790) McHenry inherited it. After attending the academy at Newark, Del., in 1772, he studied medicine under the noted Dr. Benjamin Rush in Philadelphia. At the outbreak of the American Revolution in 1775 he hurried to Cambridge, Mass., and volunteered for military service. In January 1776 he was assigned to the medical staff of the military hospital in Cambridge and on August 10 was appointed surgeon of Col. Robert Magaw's 5th Pennsylvania Battalion. When Fort Washington was taken in November he was among the prisoners. Paroled in January 1777, he was exchanged in March 1778. After brief tenure as "Senior Surgeon of the Flying Hospital, at Valley Forge," on May 15 he was appointed Washington's secretary and never thereafter resumed medical practice. Having won Washington's confidence, he was transferred in August 1780 to Lafayette's staff. Commissioned major, May 30, 1781, McHenry continued in active service until September, when he was elected to the Maryland Senate where he sat for five years. Appointed to Congress in May 1783, he served concurrently until 1786. A delegate to the Constitutional Convention of 1787, he kept a private record of the convention proceedings—one of the important sources for its history. As an ardent Federalist he worked for the adoption of the Constitution and was also a member of Maryland's ratifying convention. After a term in the Assembly, in 1791 he again became a state senator, serving another 5-year term. In January he accepted the post of secretary of war, and when the following year Adams succeeded to the presidency he retained McHenry in his cabinet. But relations between the new president and his war secretary soon became strained. A staunch Federalist, McHenry continued to look to Hamilton for political leadership, and later the president suspected him of intriguing against his re-election. On Adams' demand he resigned his office in May 1800. Thereafter he lived a retired life on his estate at Fayetteville near Baltimore. Fort McHenry, one of Baltimore's defenses, was named for him.

McHENRY, Fort. See FORT MCHENRY.

MACHETE, mä-chā'tā, a large, heavy, sword-like tool, half knife, half cleaver, often two to two and a half feet in length. It is used in Cuba and other countries of tropical America for cutting sugar cane and clearing paths through undergrowth. It is also useful as a weapon, making an excellent cutlass.

MACHIAS, mą-chī'as, Me., town and Washington County seat; altitude 80 feet; on the Machias River, near the sea; 89 miles east of Bangor; on the Maine Central Railroad. There are truck and poultry farms near by, and granite quarries; lumber and shipbuilding are also local industries. A "long lumber" log drive takes place on the river each spring. A state normal school is in Machias, and at East Machias are Washington Academy (1823) and

the summer surveying school of the Massachusetts Institute of Technology. A trading post was established here in 1633 by Englishmen, but they were soon driven out by the French. The first permanent English settlement was made in 1763 and in 1784 the town was incorporated.

In the Revolutionary War Machias participated prominently in the harassing of the British along the coast; in 1775 Machias seamen captured the British armed schooner *Margaretta* and, in reprisal, the town was partly burned by forces from the ship *Ranger*. In 1863, in observance of the town's centennial, an anniversary memorial was published. Pop. (1950) 2,063.

MACHIAVELLI, Niccolò, nē-kō-lō' mä-kē-ä-vĕl'lē or măk-ĭ-a-vel'lĭ, Italian historian and statesman, possibly the greatest prose writer of the Italian Renaissance: b. Florence, May 3, 1469; d. there, June 22, 1527. Of Niccolò's early life and education we know nothing. No trace of him remains previous to his 20th year. But of his times and the scenes amid which he grew up, we know much. It was the calm but demoralizing era of Lorenzo the Magnificent. Machiavelli was a true child of his time. He too was thoroughly imbued with the spirit of the Renaissance; and looked back, fascinated, on the ideals of that ancient world that was being revivified for the men of his day. But philosophy, letters and art were not the only heritage that the bygone age had handed down; politics—the building of states and of empires—this also had engaged the minds of the men of that age, and it was this aspect of their activity that fired the imagination of the young Florentine.

From his writings we know he was widely read in the Latin and Italian classics. But Virgil and Horace appealed to him less than Livy, and Dante the poet was less to him than Dante the politician; for he read his classics, not as others, to drink in their music or be led captive by their beauty, but to derive lessons in statecraft and penetrate into the secrets of the successful empire-builders of the past. It is not known whether he mastered Greek. Like Ariosto, Machiavelli was indebted for his superb literary technique solely to the study of the literature of his own nation.

With the expulsion of the Medici from Florence, Machiavelli, at 30, emerged from obscurity to play a most important role in the Florentine politics of the succeeding decade and a half. In 1498 he was elected secretary to the Ten of War and Peace and from 1498 to 1512 was a zealous, patriotic and indefatigable servant of the republic. His energy was untiring, his activity ceaseless and many-sided. He conducted the voluminous diplomatic correspondence devolving upon his bureau, drew up memorials and plans in affairs of state for the use and guidance of the Ten, undertook the reorganization of the Florentine troops and went himself on a succession of embassies, ranging in importance from those to petty Italian states up to those to the court of France and of the emperor.

He was by nature well adapted to the peculiar needs of the diplomacy of that day; and the training he received in that school must in turn have reacted on him to confirm his native bent and accentuate it until it became the distinguishing characteristic of the man. His first lessons in politics and statecraft were derived from Livy's history of the not overscrupulous Romans; and when he comes to take his lessons at first hand, it is in the midst of the intrigues of republican Florence, or at the court of a Caterina Sforza, or in the camp of a Cesare Borgia. Small wonder that his conception of politics should have omitted to take account of honesty and the moral law; and that he conceived "the idea of giving to politics an assured and scientific basis, treating them as having a proper and distinct value of their own entirely apart from their moral value."

During this period of his political activity we have a large number of state papers and private letters from his pen; and two works of literary cast. These are his *Decennale*, historic narratives, cast into poetic form, of Italian events. The first treats of the decade beginning 1494; and the second, an unfinished fragment, of the decade beginning 1504. They are written in easy *terzine*, and are noteworthy as expressing the sentiment for a united Italy.

When in 1512 the Medici returned to Florence in the train of her invader, Machiavelli was dismissed from his office and banished for a year from the confines of the city. Later, on suspicion of being concerned in a plot against the Medici, he was thrown into prison and tortured. He was afterward included in a general pardon granted by Leo X. But Machiavelli did not return to public life until 1525; and this interval of enforced leisure from affairs of state was the period of his literary activity. A number of comedies, minor poems and short prose compositions did not rise above mediocrity. But in one dramatic effort he rose to the stature of genius. His *Mandragola* achieved a flattering success, both at Rome and in Florence. It has been pronounced the finest comedy of the Italian stage; Macaulay rated it as inferior only to the greatest of Molière's. In its form, its spontaneity, vivacity and wit, it is not surpassed by Shakespeare; but it is a biting satire on religion and morality, with not even a hint of a moral to redeem it.

His lesser prose works are the *Life of Castruccio Castracani* and the *Art of War*, a treatise anticipating much of our modern tactics. A more ambitious undertaking, and his largest work, is the *History of Florence*. At the suggestion of Cardinal Giulio de' Medici, the directors of the studio of Florence commissioned Machiavelli to employ himself in writing a history of Florence, "from whatever period he might think fit to select, and either in the Latin or the Tuscan tongue, according to his taste." He was to receive 100 florins a year for two years to enable him to pursue the work. He chose his native tongue; and revised and polished his work until it became a model of style, and in its best passages justifies his claim to the title of the best and most finished of Italian prose writers.

But though Machiavelli had the historical style, he lacked historical perspective; he arranged his matter not according to objective value, but placed in the boldest relief those events that best lent support to his own theories of politics and statecraft. He makes his facts to be as he wishes them, rather than as he knows them to be. To Machiavelli history was largely to be written as a *Tendenzroman*—manufactured to point a preconceived moral.

Though Machiavelli wrote history, poetry and comedy, it is not by these he is remembered. The works that have made his name a synonym, and given it a place in every tongue, were written almost in the first year of his retirement from political life: 'The Prince' and the 'Discourses on the First Ten Books of Titus Livius.' Each is a treatise on statecraft; together they form a complete and unified treatise, and represent an attempt to formulate inductively a science of politics. The 'Discourses' study republican institutions, 'The Prince' monarchical ones. The first is the more elementary and would come first in logical arrangement. But in the writing of them Machiavelli had in view more than the foundation of a science of politics. He was anxious to win the favor of the Medici; and as these were not so much interested in how republics are best built up, he completed 'The Prince' first, and sent it forth dedicated «to the magnificent Lorenzo, son of Piero de' Medici.» In the 'Discourses,' the author essays «a new science of statesmanship, based on the experience of human events and history.» In that day of worship of the ancient world, Machiavelli endeavors to draw men to a study of its politics as well as its art. In Livy he finds the field for this study.

In his commentary on the course of Romulus in the founding of Rome, we find the keynote of Machiavelli's system of political science. His one aim is the building of a state; his one thought, how best to accomplish his aim. Means are therefore to be selected, and to be judged, solely as regards their effectiveness to the business in hand. Ordinary means are of course to be preferred but extraordinary must be used when needed.

In 'The Prince,' a short treatise of 26 chapters, and making little more than a hundred octavo pages, Machiavelli gives more succinct and emphatic expression to the principles of his new political science. It is the best known of all his works. It is the one always connected with his name, and which has made his name famous. For the model of his prince, Machiavelli took Cesare Borgia and cites him as an example worthy of imitation; and he has shared in the execration that posterity has heaped upon Borgia. The strangest moral contradictions abound throughout 'The Prince,' as they do in all Machiavelli's writings. He is saint or devil according as you select your extracts from his writings.

Shakespeare, reflecting English thought, uses his name as the superlative for craft and murderous treachery. But later years have raised up defenders for him, and his rehabilitation is still going on. He has been lauded as «the noblest and purest of patriots,» and more ardent admirers could «even praise his generosity, nobility, and exquisite delicacy of mind, and go so far as to declare him an incomparable model of public and private virtue.»

His rehabilitation proceeds from two causes. Later research has shown that perhaps he only reflected his time; and his works breathe a passionate longing for that Italian unity which in our day has been realized. He may be worthy canonization as a national saint; but those who are more interested in the integrity of moral standards than in Italian unity will doubtless continue to refuse beatification to one who indeed knew the Roman *virtus*, but was insensible to the nature of virtue as understood by the followers of Christ. And no amount of research into the history of his age can make his principles less vicious in themselves. A better understanding of his day can only lessen the boldness of the relief in which he has heretofore stood out in history. He was probably no worse than many of his fellows. He only gave a scientific formulation to their practices. He dared openly to avow and justify the principles that their actions implied. They paid to virtue the court of hypocrisy, and like the Pharisee of the earlier time, preached righteousness and did evil; but Machiavelli was more daring, and when he served the devil, disdained to go about his business in the livery of heaven. (See PRINCE, THE). Among the editions of the collective works of Machiavelli may be mentioned those of Milan, 1810–11; Florence, 1813; Milan, 1821–22; Florence, 1826, 1843; and Florence (6 vols., 1873–77); Boston English translation (1891). The rendering of the 'Art of War' and 'The Prince' (in the 'Tudor Translations' Vols. XXXIX and XL, London 1905), with Cust's introduction, is an admirable piece of work. Consult Dyer, 'Machiavelli and the Modern State' (Boston 1904); Morley, John, 'Machiavelli' (London 1898); Mourrisson, 'Machiavelli' (Paris 1883); Tommasini, 'La vita e gli scritti di Niccolo Machiavelli' (Turin 1882); Villari, 'Niccolò Machiavelli e i suoi tempi' (Florence 1877–82), and Burd's study (in the 'Cambridge Modern History' Vol. I, Cambridge 1902), with bibliography.

MACHINE COMPOSITION. See COMPOSING MACHINES.

MACHINE DESIGN. See DRAWING, MECHANICAL AND MACHINE DESIGN.

MACHINE ENGRAVING, a mechanical process for engraving on wood, metal or stone. Since 1880 numerous machines have been invented to produce regular tints, geometrical and other designs and patterns, far more rapidly than by hand work. The most complex engraving is now executed wholly by machinery. Engraving by mechanical means is now generally employed in the making of banknotes, diplomas, stock certificates and other papers and documents, where special designs are required. Elaborate gearing systems have been introduced whereby the cutting tools execute a certain number of symmetrical motions and thus produce elaborate geometrical patterns. The first engraving machine was the invention of Wilson Lowry and was employed to engrave the plain background, skies, etc., of a plate. Most modern machines are so fitted that the cutting tool may be moved a certain definite distance after each cut so that the succeeding cut will be a line parallel to and at a regular distance from the last. The cutting tool is also fitted so that the depth and breadth of the cut may be easily regulated. The cutting edge is usually of highly-tempered steel for metal work, except in the case of copper, which is often coated with varnish, next scratched with the design and afterward etched by acid. For stone work, the cutting tool has a diamond-point and weights on the holder regulate the depth of the cut to be made.

MACHINE FORGING. The art of the blacksmith, working by hand at the forge and

anvil, has almost wholly disappeared, and the shaping of wrought iron and steel is now performed by machines. The exact duplication of parts of machinery began in the United States about 1854, and it became necessary to have forgings of uniform size so that they could be properly handled in special fixtures or holders while being machined to exact dimensions.

Drop Forging.— In the first attempt to obtain uniform forgings the smith hammered by hand the rough stock into a rude suggestion of the shape wanted so as to properly distribute the material and then placed it in an impression cut in a block of steel or cast to shape and forced it into the cavity by a series of blows from hand hammer and sledge.

The growing demand for firearms and other accurately made mechanisms developed the necessity for improvements in this line which kept pace with the requirements of the times, until the drop-hammer was produced. These hammers are named invariably by the weight of the hammer-head or ram and they range in sizes from 50 to 5,000 pounds.

Hammers are also constructed to operate by steam power of heavier types. They lift the ram or hammer head and drive it downward by steam power in a manner similar to the regulation steam-hammer. The regular belt-driven drop-hammer, as used in drop-forging, is operated usually by a treadle which the workman trips with his foot. This movement releases a clamp or catch which holds up the hammer-head and allows it to fall or drop. It is raised by the friction of two rolls which revolve rapidly, gripping the surface of a board which is wedged into a slot in the top of the hammer-head or ram. The hammer-head is clamped or latched at the end of the upstroke by an automatic attachment and released at the will of the operator.

The hammer-head or ram is made usually with a dovetail opening at its bottom, into which is placed the upper die. It is held firmly in position by a key driven into place by sledging. The base or anvil of the drop-hammer is made of cast iron or cast steel, and a forged steel seat or holder for the lower die is keyed into the base in a similar manner. This seat or holder is frequently called a "sow" or "shoe," and is adapted merely to save useless wear of the base. It can be renewed at a small cost. A similar dovetail opening is made in this holder into which the lower die is placed. This is keyed into exact position to match the upper die so that when the faces of the dies meet at the end of the down stroke the complete impression is formed.

Drop-hammers are made generally of cast iron, i.e., the base or anvil, the side rails or guides and the lifter frame. The working parts are made from forged steel. Various heights of the fall or drop of the hammer-head can be had by shifting a "latch" or "dog" on the operating rod. From six inches to five feet fall can be obtained if desired. Foundations are best made of solid concrete. In connection with the drop-hammer a press is used to remove by a trimming operation the "flash" or surplus metal which spreads out between the dies after the impression therein is filled. This "flash" is sheared off either hot or cold as the character of the work permits.

Making the Dies.— A model of the part to be forged is made, usually of wood, if it be a form not clearly shown by a drawing. When given this model or a scale drawing and the required weight of the finished forging, the die-sinker has the principal data required by him to make the dies. After selecting the proper size blocks which have been planed smooth and made with dovetails or shanks, the die-sinker determines from his model the best parting line for the forging in much the same way as does the pattern-maker on a pattern for a casting, but the analogy between the two is comparatively slight as the conditions are radically different.

The pattern-maker can use cores and loose pieces to make cavities and overhanging parts, but the die-sinker is practically limited to a die opening in two parts, which must be made to stand the roughest usage. The outline of the piece to be forged is drawn on the surface of the die which has been coppered with a blue vitriol solution, this causing the lines to stand out sharply. The metal is then removed in a manner that is most expedient for that particular example. If the outline be circular the stock is turned out on a lathe. If the shape of the forging be such that other means are required for removing the metal from the die, the profiling machine readily furnishes a way for following the most complicated forms by means of milling cutters of various shapes and sizes. The shaper and milling machines are also impressed into service as well as the planer and drill.

Chipping by hand is commonly done, and in nearly every case a file, riffle, scraper and some emery cloth are required to finish the impression to the required smoothness and regularity.

The forming of an irregular cavity in the face of a high carbon steel die so that when its mating die is matched to it the shape of the space enclosed will not vary from the specified dimensions more than 2-1,000ths of an inch either way is an operation requiring skill and patience.

After the complete impression is made a proof can be taken by filling the cavity with melted lead. A shallow space is cut in the face of each around the impression. This is technically called the flash of the die. As it is practically impossible for the drop-forger to form the bar or billet of steel into just the shape and size required for the forging, this space must be left for the overflow of surplus metal.

If the article to be forged is of a simple form only one pair of forging dies is necessary as the "roughing" or "breakdown" impressions can be cut in the same pair of blocks which contains the finishing impressions. If the piece be more complicated, separate "roughing" or "breakdown" dies are necessary.

Trimming dies, to be used in the press, are necessary to remove the flash. They are made in male and female form; the upper part being the male die and the lower one the female. The male die is made of the outline of the forging through the parting line, and with its face conforming to all the irregularities of the upper part of the forging. The female die is open at the bottom so that the trimmed forging can fall through it into a receptacle under the press. It is also made with its cutting edge conforming to the parting line.

The dies are then heated carefully in furnaces, the heat of which is usually determined by a pyrometer to ensure uniformity of temperature, and are then hardened and tempered. Any warping in hardening which may occur is remedied by grinding the surfaces with an emery wheel. See DIES AND DIE MAKING.

The operation of drop-forging consists of first heating the bar or piece to a proper temperature. The heat depends entirely on the quality of the metal used. It is then placed in the «roughing» or «breakdown» impression and given a number of blows which shape it roughly into form and it is finally placed in the finishing impression and forged to the exact shape. The flash is then trimmed off in the press and the forging is practically complete.

The number of blows required depends entirely on the shape and size of the forging. Some pieces can be made by two or three blows while others may require as many as 100.

If the forgings are made of high carbon steel it is frequently necessary to anneal them so that they can be readily machined, and in many cases pickling in a weak solution of sulphuric acid is resorted to, so as to remove the scale or oxidation which forms on the surface of each forging while cooling.

Drop-forgings can be made from iron, steel, copper, bronze or aluminum, or from any metal which will not disintegrate during heating or while being worked. For instance, brass cannot be forged successfully. They can vary in weight — from a fractional part of an ounce to over 100 pounds each.

Upsetting and Forging Machines.— Toward the close of the 19th century it became recognized that forging could be accomplished by pressure as well as by blows, and this idea was developed into the commercial upsetting and forging machines which now handle the bulk of small parts and a good many large parts of modern machines. Hammer-blows cause jar and vibration which are destructive to the machine itself, and require heavy foundations, heavy bed-plates, etc. The pressure machines do their work with less noise and more scientifically. The very much reduced cost of building automobiles and a great variety of duplicate machines that are turned out in large numbers is due largely to the quick shaping made possible by machine forging. An upsetting and forging machine is made with a very heavy steel bed. The opposed dies for gripping the work are gripped in the machine, and the pressure is applied by a toggle-joint mechanism. In all such machines it is necessary to limit the pressure, else excess would break the machine. This limitation is accomplished in two ways — by placing heavy springs in the machine which give when a certain pressure is attained; and by locking the back of one of the die supports with a bolt of a given strength, arranged between hard square edges which will cut or shear off the bolt when the pressure reaches above a given point.

The method of making a common hexagonal nut in such a forging machine consists in (1) placing the dies in the forging machine; (2) heating a bar of iron between 1,400° and 1,600° F. — the temperature varying with the character of the iron; (3) thrusting the red-hot end of the bar into the lower die in the forging machine, and throwing the lever to cause the machine to squeeze, which upsets the end of the bar and shapes it for a nut; (4) withdrawing the bar quickly and placing in the upper die; (5) repeating the squeeze, which forces the hole through the nut, leaving the removed metal on the bar, and separating the nut. The nut is delivered with a slight fin, which has to be removed, when it is ready to go to the thread-cutter.

The front axle of an automobile may be forged in one of these pressure forging machines in about seven operations. The last squeezing operation delivers the completely formed axle. Any quantity of more or less intricately formed parts are now made of wrought iron and steel in this manner, the heavier operations being done on the steam-hammer, as a rule.

The forging machine is also used for welding or joining separate pieces by pressure. It is just as easy to apply a flux to assist the joining in the forging machine as on the anvil. The Ajax universal forging machine not only compresses the dies, but has an independent vertical press that can be used for any operation within its capacity; also a punching device and a trimmer.

A variety of special forging machines are made for forming common articles, or parts required in large quantity. Many of them are named after the work they accomplish. The hot-pressed centre-feed nut machine is simply a small forging machine designed for making nuts. Bolt-heading machines and bolt and rivet headers are other examples of special forging machines.

Pressed steel is made by great hydraulic presses at the steel works. Pieces requiring but slight shaping are pressed in the cold; more or less complicated forms are heated to a cherry red and then light-pressed. Modern railway steel cars are made in this manner. Armor plates are formed in hydraulic presses under immense pressures which are maintained for a considerable time.

CHARLES H. COCHRANE.

MACHINE GUN. An automatically reloading weapon of small calibre which discharges several bullets per second when pressure is maintained on the trigger; the weapon most destructive of life in modern warfare. There are four general classes of machine guns as to size: submachine guns, and light, heavy, and special machine guns. They may also be classified as gas-operated and recoil-operated, depending upon whether the automatic reloading is accomplished through the action of a part of the escaping gases of each exploding cartridge, or through the action of recoiling parts. Other classifications are based on belt-feeding and magazine-feeding, and air-cooling and water-cooling. Belt-fed guns use cartridges held in the loops of a narrow belt, usually of cloth, which contains several hundred rounds and moves rapidly through the feeding and firing mechanism during firing, until the belt is exhausted and the first cartridge of a new belt must be engaged into the mechanism by hand. Magazine-fed guns use metal cartridge containers (magazines) which are inserted full of cartridges in a receptacle of the gun and remain there till emptied, when, for further firing, the

empty magazine must be removed and a full one inserted. Both belts and magazines can be reloaded and used repeatedly.

Air-cooled guns have projecting, and usually circular, metal fins along the outside of the gun barrel to radiate away the heat generated by firing, and make use of the movement of air over these fins to cool the gun. Water-cooled machine guns have a cylindrical water jacket or tank around the barrel for the same purpose. Air-cooled guns as a rule become hot more readily than water-cooled. With either, it becomes necessary after a few minutes of continuous firing to cease firing and allow the gun to cool off. Otherwise the barrel becomes red hot and its metal softened, so that further firing destroys the accurate rifling within the barrel. Since it may be necessary in combat thus to spoil a barrel, spare barrels are carried for most types of heavy and special machine guns.

Submachine Gun.—This is a magazine-fed weapon of about the weight of a shoulder rifle. It is usually held in both hands and fired from the waist, but can also be fired from the shoulder. The best known type is the Thompson, which uses calibre .45 pistol ammunition in magazines holding 20 or 50 rounds. It is a powerful weapon for fighting at close range, and is used by police and criminals as well as by armies. This weapon is standard equipment in the cavalry of the United States Army, where it is used as a close-in-defense weapon for armored scout cars and combat cars (tanks) and as a weapon for motorcyclists. It is also used in the United States Marine Corps.

Light Machine Guns.—The term «light» simply means that the gun and its mount, usually weighing under 25 pounds, and a few hundred rounds of ammunition can readily be carried in combat by a single soldier, though others must carry enough additional ammunition for the sustained firing of battle. All light machine guns are air-cooled and most of them magazine-fed. This class strictly includes also the «automatic rifle,» a fast-firing shoulder weapon without a mount. The automatic fire of this weapon, however, cannot be held to accurate aim. Consequently, in the United States Army, a folding bipod mount attached near the muzzle and a small, adjustable, single-stand mount attached to the stock have been used to convert the standard Browning automatic rifle, an air-cooled, gas-operated weapon, into a light machine gun. This weapon is still fired from the shoulder like a rifle by the soldier in a prone position, but the additional points of contact with the ground have much increased its accuracy.

Light machine guns, because of possible overheating, are not capable of the high rate and sustained periods of fire of heavy machine guns. The actual rate of automatic fire of most light machine guns is from 250 to 500 rounds per minute. But to avoid overheating and waste of ammunition, they are fired in bursts of four or five rounds, with intervals of several seconds between bursts to observe the effect of the firing and regain accurate aim. Also, time is consumed in exchanging empty magazines for loaded. Hence the maximum practicable rate of fire is seldom over 100 rounds per minute. Most light machine guns can also be limited to single-shot fire by a simple lever adjustment.

In most armies of the world, both light and heavy types of machine guns are of the same calibre as the standard infantry rifle, and thus use the same ammunition. In the United States Army, all machine guns except certain special types are calibre .30.

Light machine guns are used mainly for direct fire against hostile targets visible to the gunner. The method of operation is similar to that of the heavy machine gun in direct fire described below. For tactics of light machine-gun units see INFANTRY.

Heavy Machine Guns.—The weight of a heavy machine gun and its mount and accessories requires its transportation by some other means than carrying by hand, except for short distances in actual battle. Hand-drawn or animal-drawn carts, pack animals, and small motor-truck carriers are all used. The United States Army, between 1930 and 1940, changed from animal to motor transport for heavy machine guns, in all but a few units. European armies, by 1940, were still using animal transport in the main. Tanks and armored cars, and fighting types of airplanes, also are essentially machine-gun carriers of special types. When heavy machine guns must be carried by hand, one member of the gun squad carries the gun, and eight or ten others carry the tripod mount, the extra water containers (for water-cooled guns), the spare barrels and other accessories, and the boxes of ammunition belts or magazines, so that each carries from 25 to 40 pounds.

Heavy machine guns may be either air- or water-cooled and almost all types are recoil-operated. The automatic fire rate of heavy machine guns is from 450 to 600 rounds per minute for those used in ground combat. These are also fired in short bursts, so that the maximum practicable rate of fire is about 250 rounds per minute for ground combat.

Operation of Heavy Machine Guns.—In combat on the ground heavy machine guns are usually fired from a low, sturdy tripod mount to which the gun is firmly clamped. A fixed mount of some kind is necessary. The gunner sits or lies behind the gun to aim and fire it. The tripod has an elevating and depressing mechanism operated by a handwheel for moving the gun up or down, and may also have a traversing mechanism, similarly operated, for moving the gun laterally. Some types require traversing to be done by heavy blows of the hand against the tightly clamped gun to turn the gun and its pintle in the socket of the mount. Most heavy machine guns permit a 360° traverse without moving the tripod, although the gunner can only traverse about 120° without moving around to a new position.

Before firing, the gunner adjusts his aim through sights similar to those of a military rifle. The point of aim may be an actual hostile target, such as troops, in «direct» machine-gun fire; or an established aiming point, such as a mark on a stake, in «indirect» fire conducted at hostile targets not visible to the gunner. Since vibration and smoke make it impossible to look through the sights during firing, the gunner, in direct fire, observes the effect of his fire over the top of the gun and sights, usually by watching the dust or earth raised where the bullets strike the ground. In indirect fire the gunner cannot observe. In both kinds of firing, the gunner pauses briefly after every few bursts to

check his aim through the sights because vibration may settle the mount in the ground. To obviate such settling, bases of wood or concrete, with sandbags or clamps to hold the legs of the tripod solidly in place, are used in machine-gun emplacements of permanent or semipermanent defensive positions.

The fire of heavy machine guns may be directed at a «point» target such as an enemy machine gun or a small group of men, but is mainly used to cover areas of some width and depth. Owing to the vibration of the gun, the discharged bullets do not follow accurately in the same path of trajectory. At a range of half a mile, for example, the bullets strike level ground within a beaten zone which is about 150 feet long and 10 feet wide. Consequently, if a burst or two is fired at one setting of the gun in elevation, and the gun is then alternately fired and traversed through a slight angle in one direction (continually to right or left) a series of adjacent beaten zones of any desired total width up to several hundred feet can be covered by fire. As an example, an area 300 by 300 feet may be assigned to a single gun. By alternately traversing and firing from one side of this area to the other, the gunner covers the full width of the area and about one-half (the nearest half) of its depth, except for the ground sheltered behind rises and depressions which the flat trajectory of the gun cannot reach. The gunner then increases the range by elevating the gun enough for the fire to strike the farthest half of the square area, and alternately fires and traverses in the opposite direction, and thus covers the whole area with fire. By alternately firing bursts and traversing (or elevating or depressing) the gun, the gunner can cover an area of any shape with fire.

For direct fire, heavy machine guns are usually placed in pairs to insure continuous fire in combat because the firing mechanism occasionally jams. Gun squads are thoroughly trained to remedy most stoppages in a few seconds. The two guns of a pair are fired from positions far enough apart to prevent the destruction of both by a single enemy shell but close enough for fire direction under one leader. The two guns of a pair may cover the same area or point target with their fire. But for targets wider than approximately the angle subtended by 100 feet at 1,000 feet, each gunner usually fires on half of the target width. For direct fire on extremely wide targets, four guns may be fired under the direction of a single leader. Guns are used singly only when an extended front must be covered by few guns. Direct machine-gun fire is considered effective at targets up to ranges of about a mile. Beyond that range the effect of the fire cannot be observed, even with field glasses.

Indirect fire, on areas out of sight of the gunners, is effective up to about two miles with accurate, modern, heavy machine guns. For this fire, the guns are usually employed in batteries of four under the direction of one officer. The data from which are found the elevation and directions for pointing the guns to hit the unseen target, are calculated in two ways. Ranges and angles-of-direction may simply be measured on an accurate map or airplane photograph containing the positions of the target and the guns. Or ranges and directions may be measured directly on the ground from some high point from which the guns and the target can both be seen. For the latter method, an optical instrument called a range-finder is used to measure ranges, a magnetic optical instrument such as an aiming-circle, is used to measure vertical angles from the north and horizontal angles. The horizontal angles and ranges from the observation point to the target and to the guns are plotted on a drawing board. A line is drawn from guns to target, the range measured with a scale, and the direction-angle with a protractor. This procedure amounts to a simple survey, and may be expanded to include one or more intermediate observation points between the guns and the point from which the target is visible.

The rapidity of such surveys depends largely upon the accessibility of the observation points. If most of the distance can be traveled in a motor vehicle, a survey from a single observation point can be completed in a few minutes, and the result either signalled or taken back to the guns. To determine the correct angle-of-elevation for the guns to hit the targets requires a simple calculation to allow for the difference in elevation of guns and target, and then a reference to a brief set of firing tables in which range is converted into angular measurement. The guns are then turned and raised to the correct angle. Firing may begin then, or at any time later when the enemy is known or suspected to be occupying the area at which the guns are directed. Surveys are often made, and data calculated and recorded in advance, for a number of possible future targets.

Organization and Tactics of Light and Heavy Machine-Gun Units.—In a broad sense there are no separate tactics for light or heavy machine guns. During the World War of 1914–18, heavy machine-gun units were organized in battalions of three or four companies each manning about 12 guns. The experience of battle proved, however, that three battalions could seldom be used in combat as units, and that even companies had to be split into their separate four-gun platoons for purposes of combat. The battlefield also proved that machine-gun units have no tactical uses distinct from those of the infantry rifle units. And as a result, the tendency in all armies after 1918 was to include heavy machine-gun units in infantry battalions or regiments in the ratio of about one company (12 guns and some 200 men) to three rifle companies (some 600 men), and to include light machine-gun units within the rifle companies and smaller units. Except for the fact that some heavy machine guns were replaced by special antitank machine guns in 1938, this is now true in the United States Army as in other major armies. See INFANTRY.

The part of the machine gun in infantry tactics, both offensive and defensive, is that of a powerful supporting weapon. In an attack, light machine gunners keep close in rear of the leading riflemen and fire to the front through gaps between rifle units, and also across the front of adjacent rifle units which have been held up by hostile fire. Heavy machine guns, from positions farther back, usually on high ground, fire over the heads of the advancing rifle units or along their flanks, as long as it is safe to do so. When the rifle units (including light machine-gun units) have advanced some distance against the enemy, say half a mile, heavy machine guns are rapidly loaded into light cross-country motor

carriers and moved forward to new positions from which they can again support the rifle troops. About half of the heavy machine guns supporting a given number of rifle units are thus moved forward at a time, and the other half are kept in the original firing positions until the others are firing from their new positions. The rear guns then move forward to new positions. This movement forward by bounds from one supporting position to another continues until the leading rifle troops reach and occupy the final objective.

In an attack, the fire of supporting light machine guns and often that of heavy machine guns, is almost always placed on hostile resisting elements, such as groups of riflemen and machine gunners, whose positions are either definitely known or suspected. Whenever possible, fire is delivered at enemy elements whose fire is liable to prevent the continued advance of the rifle units leading the attack. Only when the irregularities of the ground prevent direct fire do heavy machine-gun units employ indirect fire upon areas liable to contain enemy troops but not definitely known to. Thus, in offensive combat, the fire of light and heavy machine guns is never simply an aimless hail of lead striking the general areas that the enemy holds. If there are no known or suspected targets for machine gunners to fire upon, they save their ammunition for a more effective use later on.

If tanks are assisting the leading rifle units in the attack, the work of light and heavy machine guns differs little from that already described. In defensive infantry combat machine guns are the most important weapon. See INFANTRY.

Airplane and Tank Machine Guns.—The heavy machine guns used in the airplanes of an army are usually of the same types used by ground troops except for being air-cooled instead of water-cooled and for having special mounts. Modern fighting planes have as many as eight guns mounted under the wings to fire forward and operated by a single trigger from the cockpit. For air fighting these guns are given a high rate of fire, above 1,200 rounds per minute in some types. For defense against attack by hostile planes, bombardment and other large types of planes have heavy machine guns mounted in cockpits for individual fire upward and downward and to the sides and rear.

Both air- and water-cooled machine guns are used in tanks and armored cars. See TANKS and ARMORED CARS.

Special Types of Machine Guns.—Special machine guns include such weapons as the calibre .50 antitank machine guns used by the infantry and cavalry of the United States Army, and calibre .50 antiaircraft machine guns used by the Coast Artillery Corps. Some fighting aircraft carry such machine guns and they are also mounted in tanks and armored cars. They may be either air- or water-cooled and are recoil-operated and usually belt-fed. They fire bullets several times the weight of those used in rifles and heavy machine guns. Antitank machine guns are mounted on low tripods and antiaircraft machine guns on high ones. Both weigh so much that they are carried by hand only for short distances and are largely transported on motors.

CAPT. JOSEPH I. GREENE, Infantry;
Associate Editor, The Infantry Journal.

MACHINERY-MANUFACTURING INDUSTRY IN AMERICA. Owing to the restrictive measures of Great Britain this industry made a late start in America; but when a beginning was made, the very laws by which the mother-country sought to make the States dependent on her proved more stimulating to the development of our machinery-manufacturing industry than the most rigid system of protective tariff would have been. Great Britain wished to confine manufactures to her shores and compel the American colonists to buy their manufactured articles from English factories. At first the colonists were not allowed either to manufacture or to import machinery. In the year 1774 a statute was enacted by Parliament instituting the restrictive system as to textile machinery. This statute was made more stringent in 1781, and it was not actually repealed till 1845. This act prohibited the exportation of «any machine, engine, tool, press, paper, utensil, or implement whatever, which now is, or may at any time be, used in or proper for the preparing, working, pressing, finishing, or completing of the linen, cotton, wool or silk manufactures of this kingdom, or any other goods wherein wool, silk, or cotton is used, or any part of such machine, etc., or any model or plan of any such machine,» under penalty of forfeiture of the tools or machine, the payment of a fine of £200 and imprisonment for one year. Further, foreigners were prohibited, under a penalty of £500 and imprisonment for 12 months, «from seducing artificers, and others employed in the manufactories, to depart out of this kingdom; and if any artificer has promised or contracted to go into foreign parts to practise or teach his trade, such artificer may be obliged to give security, at the discretion of the court, that he shall not go beyond the seas, and may be committed to prison until he give such security.»

These laws were rigidly enforced; and it was seldom that they were evaded. It was impossible even to smuggle a textile machine into this country; and the models that were surreptitiously imported were imperfect. Tench Coxe, the coadjutor of Alexander Hamilton in the Treasury Department, made arrangements to have models of Arkwright's patents sent to him; but before they could be shipped they were detected and forfeited. In 1786 the General Court of Massachusetts appointed a joint committee to investigate textile machinery; and this led later to the employment of Samuel Slater and to the real beginning of machinery-manufacture in this country. Slater landed at New York 17 Nov. 1789; and in the following January he made arrangements with Messrs. Brown and Almy, of Providence, R. I., to construct for them textile machinery on the English plan. He made most of the machinery with his own hands and set it up at Pawtucket, R. I. This was the first textile mill in this country to use the Arkwright system. It was opened 20 Dec. 1790. It must be remembered that Slater brought with him from England no implements to work with, and no plans or models. He had to depend entirely upon his memory. Alexander Hamilton called him «the father of American manufactures»; but, in the first place, he was the father of American machinery. Up to the time of his coming there were no machines in this country, with the exception of the rude saw-mill, grist-mill and fulling-mill; some rolling and slitting

mills, foot-lathes, and a few home-made carding and spinning appliances. The first carding-machine worked in the United States was constructed at Newburyport, Mass., in 1793, by John and Arthur Scofield. Until then the household looms were the only domestic source of supply of woolen cloth.

At this time the manufacture of metal working machinery was in its infancy. The lathe was known only in its simplest form, i.e., two dead centres supporting the work as it was rotated backward and forward by a band around it, one end attached to a spring-pole above it, the other end to the foot of the operator, who held the turning-tool in his hand. Even after the lathe had been provided with a revolving spindle and centre to support and rotate the work, the tools used for turning both wood and iron were still manipulated by hand. The increasing demand for accurately-cut cylindrical iron pieces, which could not be made by hand, led to the general use of the slide-rest. Formerly used only by the optician and the maker of mathematical instruments, it now became a necessary adjunct of the mechanic's lathe. This gave the lathe practically unlimited capacity to turn out exact cylindrical work; but in order for the slide-rest to do its work, it had to be manipulated by the workman. The next step was naturally the introduction of the slide-lathe, by which the rotation of the work and the advance of the cutting tool are accomplished automatically. Owing to the lack of suitable tools to make the long flat surfaces required in such a machine, the slide-lathe had a curious development. The hammer, file, cold-chisel and straight edge were the only tools at hand. The planing-machine was the development of a demand for greater accuracy in the slide-rest. It marked an era in the life of the machinist as great as that of the slide-rest itself. It is doubtful when the first planing-machine was made in the United States; but we know that there were only four such machines in this country in 1838. With this machine the rough and uneven surfaces of castings could be smoothed and reduced to true planes. Up to this time the drill had been limited to a revolving vertical spindle. The boring-mill or vertical lathe was now possible and took its place in the machine-shop for the execution of a large class of turned work that did not require to be supported on centres, such as wheels to be keyed upon their shafts. In fact, the first development of the planing-machine was the key-seating machine. It was soon recognized that such a machine could be turned to other work, and further changes were made accordingly. It was provided with compound slide-rests, with a revolvable table mounted thereon and in this form it took its place as a standard tool in the machine-shop under the name of the slotting-machine. This planer, with its vertically movable tool, was the progenitor of a machine with similar attachments, but with its tool moving horizontally, upon which work could be conveniently shaped in a great variety of forms; and the shaping-machine, as it was called, soon became one of the standard tools of the machine-shop. Meanwhile, the old vertical spindle drill, with its compound tables, movable vertically and adjustable horizontally, in two directions at right angles with each other, had been supplemented by the horizontal drill, with similar tables, but with its drill-spindle parallel to the tables; and the further requirements in this direction had been supplied by the radial drill, in which the vertical drill-spindle is movable about a vertical axis, to which it is adjustable radially.

However, there were other factors entering into the development of our machinery industry. There were other requirements beside these machine-tools, and which these supplied inadequately. Screw-bolts and nuts were needed for putting the machines together. Originally iron screw-bolts had been made by means of a split die provided with spiral threads, by rotating either the bolt or the die backwards and forwards until the thread was partly cut, while a taper-tap was screwed into the nut first from one side, then the other, until the bolt was found to fit into the nut. These bolts were not interchangeable. This primitive system of bolt-manufacture continued until 1847, when the solid die with sectional threads patented by Philetus W. Gates was generally introduced. This die cut the thread at one pass, then the rotation was reversed to unscrew it from the bolt, which marked the thread and was liable to mutilate the die. No compensation for wear was possible. Nothing approaching perfection was attained until 1857, when William Sellers devised a bolt-machine in which dies to cut the thread at one pass, and adjustable to size, could be opened and closed while running continuously in one direction. Since then ordinary screw-bolts have been made interchangeable. In a few years this machine of Sellers' was introduced into England and also continental Europe. The first turret lathe was built by Stone in 1854. It was provided with automatic mechanism for turning the turret in 1855, and perfected to its present condition in 1858. The gear-cutter was another of the early machine-shop tools. This was simply a revolving milling-cutter, mounted upon a spindle above the dividing-plate. The wheel to be cut was forced against this. The machine was adjusted by hand. Such work was slow and very expensive; and up to 1867 the teeth of nearly all wheels, even for fine machines, were cast. In this year a machine was devised by William Sellers which limited the work of the operative to adjusting the wheel to be cut to the cutter. The machine was otherwise automatic; and it was now possible for one workman to attend to several machines, thereby greatly diminishing the cost of such work. From that time cast wheels have been no longer allowable in first-class machines. Another typical machine-tool that deserves mention is the milling machine. It has received its greatest development in this country. The manufacture of metal-working machinery has become highly specialized, and only the older establishments produce a number of different types of machines. New establishments usually make only one type of machine, or at most one class embracing tools of similar type. Some establishments make only engine-lathes, others only planers, others nothing but milling-machines. The effect of specialization has been to make machine-tools more efficient, and, it may be added, more varied. If, for instance, a new construction is designed, as in the automobile, or airplane, and strangely fashioned parts are required, a machine that will make these parts is always forthcoming.

The development of more accurate machinery, as indicated above, led to the system of interchangeability. In the manufacture of

machinery this is an economic principle of the greatest importance. Under more primitive methods individual parts had to be fitted together with great difficulty and at much expense. Now all these parts are made by machines with such exactness that they are completely interchangeable; and there is no longer any question as to their fitting. This method of manufacture has increased the output of the individual workman and reduced the cost of production tremendously. Though first applied in Europe, it remained for the United States to demonstrate its feasibility and actually put it into successful operation, and it is generally referred to as the American system. For the economical manufacture of any kind of machinery in which many parts are to be interchangeable certain definite conditions must be met; and success economically requires that every part shall be finished without the intervention of a skilled workman. The machine must be so designed that it will not only work automatically but work with a high degree of accuracy. Reference standards must be provided with which to compare the several parts in order to determine the amount of variation permissible between the standard and the product; every part must come from the machine in the final finished form. Such are some of the details that make necessary a careful study of every part in order to design a machine that will perform each operation with the most efficiency.

The principle of interchangeability was first suggested and put into operation in a small way by Le Blanc, in France. Its importance and possibilities were at once recognized by American inventors, and its first application in the United States was in the manufacture of fire-arms in our government arsenals under the direction of Eli Whitney, the inventor of the cotton-gin. Simeon North, a maker of pistols, and a neighbor of Whitney, also adopted the system. By 1818 both of these men were using drilling and filing jigs. The growth of the system was slow, being confined for a time to the principal parts; but even in this undeveloped condition it proved successful economically. In 1822 Calhoun, who was then Secretary of War, remarked to Whitney that his improvements were saving the government $25,000 a year at the two public armories. The drop-hammer and dies were first used by Hall, at Harper's Ferry in 1827. Whitney adopted this machinery and thus was able to cut from red-hot metal all the smaller parts of a gun in a form closely approximating the finished article. These forged parts were then subjected to the more accurate milling-machine, which turned out the parts in uniform condition, no matter how varied their shape may have been when they came from the forging-press. It only remained for the drill to fashion the bearings for the working parts and bore the holes to secure the parts together. This was a comparatively simple matter when once the order of procedure had been determined and the guiding templets or jigs provided. The wooden stocks of the gun were also made by machinery and with sufficient accuracy to make them interchangeable. This was accomplished by means of a turning-lathe designed by Thomas Blanchard and patented by him in 1820. After the stock came from the lathe the groove for the barrel and the cavity for the lock were hollowed out by special machinery. Measured by the standards of to-day all this work was crude; but the gun of that day was itself crude, and these roughly interchangeable parts served their purpose. Machine-tools were then both inaccurate and limited in variety, so that they could not be expected to turn out the various parts with mathematical accuracy. Further, at that time there were no such delicate measuring instruments as we have to-day. The most refined measuring instrument known then was the vernier caliper; and the smallest deviation from the standard that could be detected with this contrivance was, at best, perhaps the thousandth part of an inch. In 1848 the interchangeable system was applied to watch-making at the Waltham factory, and in 1850–51 it was adopted for sewing-machines. The profiling machine was developed between 1848 and 1852 by F. W. Howe and E. K. Root. Since then have come great developments in the quality of machine-tools and in their wonderful adaptability to changing needs. Measuring instruments have now been so highly developed that a variation of the twenty thousandth part of an inch can be detected immediately and with perfect accuracy.

Foreign countries did not remain indifferent to the success of the United States in the employment of the principle of interchangeability of parts. Various commissions were appointed to investigate the system; and, as remarked above, the economic success of the United States in producing interchangeable parts led to the adoption of this method in Europe. In 1854 the Colt factory was established at Hartford, and shortly afterward a British commission bought from them a full outfit of machinery for making the Enfield rifle on the interchangeable system. Between 1870 and 1880 our large machinery manufacturers were kept busy filling foreign orders, especially for gun machinery. Large orders for such machinery were received from the German government; and it was even stipulated in the contract that the manufacturers should send over men to set up the machinery and instruct native workmen how to run it. Other governments began to look to us for their machinery; and thus our system for the manufacture of interchangeable parts was gradually established in England and continental Europe. This principle of interchangeability, first applied to the manufacture of fire-arms, then to pistols, has now been extended to practically every kind of machine. The sewing-machine, the typewriter, the bicycle, the watch, the various kinds of agricultural machinery, the gasoline engine, and notably in the automobile, may be mentioned as types showing the economic value of the principle of interchangeability. All our large machinery manufacturers are represented in foreign countries, and certain types of American typewriters, sewing-machines, cash registers, mowing-machines, reapers, etc., are just as well known there as they are here. American textile machinery and shoe-making machinery play an equally important part.

The giving of detailed information of the entire machinery-manufacturing industry of the United States is well nigh impossible, due to its many ramifications, but the following facts and figures are both interesting and instructive. The machinery manufacturing industry includes many categories, chief of which in value of products is the automotive industry. Following

in order are motor vehicle bodies and parts; electrical machinery; agricultural implements; mechanical refrigerators; machine tools and foundry and machine shop products and forgings. Other classifications, as given in the census of manufactures, are gas machines and gas and water metres; pumps and pumping machinery; sewing machines; textile machinery; typewriters and supplies; washing machines and ironers; locomotives and railway cars; ships, and engines and water wheels. The total value of motor vehicles and of automobile bodies and parts in 1938 was $5,176,235,000. The 1,067 establishments engaged in these industries in that year employed 478,341 workers and paid out $756,080,000 in wages. The number of plants engaged in the making of carriages, wagons and sleighs showed a steady decline during 24 years from 1914 to 1938. In 1914 there were 4,662 establishments. In 1927, the number had declined to 117 and in 1938 the total number of plants was 43 with a total output of products valued at $9,138,453. Heavy transportation machinery such as locomotives and railroad cars also declined materially in number of plants and in value of output, the total value of locomotives being only $72,123,000.

In 1938 the number of establishments producing machinery, exclusive of those making transportation products, was 6,876. These plants employed 816,948 workers who earned $1,180,429,000 in wages and produced output valued at $4,790,151,000. In 1927 the number of establishments was 12,037; the number of workers was 886,427; the wages paid amounted to $1,287,778,000 and the value of the product was $5,368,015,000.

The number of establishments making transportation equipment in 1938 was 1,870. These employed 615,064 workers and the total of wages paid amounted to $957,098,000. The value of the output of the plants was $5,910,699,000. In 1927 the number of plants was 2,537 and in these 494,905 workers were employed and earned wages totaling $803,298,000. The output of finished product was valued at $4,693,972,000. In 1914 there were 7,818 plants; 312,562 employees who earned $230,615,000 and the output totaled $1,137,423,000 in value.

The value of machinery manufactured in 1938, exclusive of transportation equipment, totaled $4,790,151,000. Agricultural implements, including tractors, made in that year were valued at $554,778,000. Electrical machinery was valued at $1,622,098,000. Electrical refrigerators had a value of $363,178,000. Foundry and machine shop products and forgings had a value of $520,138,000. Engines and water wheels produced were valued at $194,695,000; pumps and pumping equipment, $198,721,000; machine tools, $260,242,000; sewing machines, $34,835,000; washing machines, $69,888,000. Aircraft production in 1938 was valued at $106,568,000 against $21,162,000 in 1927.

See HARDWARE INDUSTRY; FARM MACHINERY; and articles on special types of machinery.

MACHPELAH, măk-pē'lą, **Cave of,** Hebron, Palestine; in Old Testament history the burial place of the patriarchs. Upon the traditional site stands a superb mosque which only Mohammedans are permitted to enter, although by a special firman of the sultan the Prince of Wales visited it in 1862, the Marquis of Bute in 1866 and the Crown Prince of Prussia in 1869.

MACHRAY, mą-krā', **Robert,** Canadian Anglican archbishop: b. Aberdeen, Scotland, 17 May 1831; d. Winnipeg, Canada, 9 March 1904. He was graduated at King's College, Aberdeen, in 1851, and from the Sidney Sussex College, Cambridge, in 1855. He was of Presbyterian stock, but joined the Church of England and was ordained deacon in 1855 and priest in 1856. He was appointed vicar of Madingley, near Cambridge, in 1862, and in 1865 he was Ramsden preacher at Cambridge. He was appointed bishop of Rupert's Land, Canada, in 1865, and was consecrated in May of that year. His diocese covered 2,000,000 square miles of territory with headquarters at the then hamlet of Winnipeg, and but 18 clergymen to assist him. He was active in the promotion of education, renewed and reorganized the defunct Saint John's College at Winnipeg, and himself lectured in ecclesiastical history, liturgiology and mathematics. He was one of the founders of Saint John's Ladies' College, and upon the establishment of the University of Manitoba in 1877 he became chancellor, retaining the office until his death. He had meantime organized his diocese with a view to serving the fast-increasing population. He became metropolitan of Canada under the primacy of the archbishop of Canterbury in 1875, and upon the union of the Canadian Anglican churches in 1893, he became archbishop of Rupert's Land and primate of all Canada. Consult Machray, Robert, 'Life of Archbishop Machray' (1909).

MACHUELO, mą-chwā'lō, Spanish name current in the West Indies for the thread herring (q.v.), an inedible, shad-like fish (*Opisthonema oglinum*) of the Atlantic coasts of the United States and the waters of the West Indies.

McILHENNEY, Charles Morgan, American landscape painter: b. Philadelphia, 4 April 1858; d. 1904. Having studied under Frank Briscoe, he continued his training at the Academy of Fine Arts in Philadelphia, and soon began to win recognition in his chosen field. Among his best-known works are 'A Gray Summer Noon' (1884), and 'The Passing Storm' (1887); 'Old Friends' (1891); 'On the Beach' (1891); 'Gray Morning' (1892); 'September in the Marshes' (1893). In 1893 he was awarded medals at the Columbian Exposition and won the first Hallgarten prize.

McILVAINE, măk'īl-vān', **Charles Pettit,** American Protestant Episcopal bishop: b. Burlington, N. J., 18 Jan. 1799; d. Florence, Italy, 13 March 1873. He was graduated at the College of New Jersey (now Princeton University), in 1816; entered the Princeton Theological Seminary in the same year, and was ordained deacon in 1820 and priest in 1821. His first pastoral charge was at Georgetown, D. C., which he left in 1825 to become professor of ethics at the United States Military Academy, West Point. He became rector of Saint Ann's Church, Brooklyn, in 1830, and in 1831 undertook the duties of the professorship of the evidences of religion and sacred antiquities in the New York University. He did not long hold the chair, however, as he was the next year elected bishop of Ohio, to succeed Bishop Chase, who had resigned the see. The question of the legality of such a resignation excited considerable interest in the General Convention of that year, but in the interest of the

diocese both houses agreed in approving Dr. McIlvaine's testimonials, and he was accordingly consecrated in Saint Paul's Chapel, New York. Upon his removal to Ohio he was elected president of Kenyon College, Gambier, founded by Bishop Chase, and held the position until 1840, acting also for some years as president of the theological seminary in the same place. During his long episcopate he came to be recognized as one of the most influential leaders of the Evangelical or Low Church party in America, and his ability and courtesy were cordially recognized by those who differed from him most widely. During the Civil War he was one of the four ambassadors informally appointed by President Lincoln to set before the English people what was considered in the North the real significance of the War. He published various sermons, addresses and more important theological works, mainly directed to defending the positions of his party in the Church.

McILWRAITH, mäk"l-räth, **Jean Newton,** (JEAN FORSYTH), Canadian author, daughter of Thomas McIlwraith (q.v.): b. Hamilton, Ontario, 1871. She was educated at Ladies' College, Hamilton, and studied English literature in the correspondence classes of Queen Margaret College, Glasgow, for 10 years, engaging in editorial work in New York in 1902. She is a frequent contributor to magazines and is author of 'History of Canada' in 'Children's Study Series' (1899); (joint author with William McLennan) 'The Span o' Life' (1899); 'The Curious Career of Roderick Campbell' (1901); 'The Little Admiral' (1924); 'Kinsmen at War' (1927).

McILWRAITH, Thomas, Canadian ornithologist: b. Ayreshire, Scotland, 1824; d. 1903. He was educated in Scotland and emigrated to Hamilton, Ontario, in 1853, where he spent the remainder of his life. He became known through his classification of the birds of Canada and his study of their habits, which subject he pursued as a recreation. He was a member of the conference of American ornithologists held in New York in 1883, out of which came the American Ornithologists' Union. He served for many years as superintendent of the district of Ontario for the Migration Committee of the American Ornithologists' Union. His first report of Canadian birds was published in the *Canada Journal* in 1861, and his 'Birds of Ontario' was published by the Hamilton Association (1886; author's ed., 1887; 2d ed., 1894).

McINTIRE, Samuel, American wood carver and architect: b. Salem, Mass.. Jan. 1757; d. there 6 Feb. 1811. His influence upon architecture is exampled principally in his native town, where houses of his design, construction and ornamentation are preserved and give to one of the streets such distinction that it has been termed the most beautiful of our colonial streets. McIntire had carved figureheads for sailing vessels, which made Salem foremost of seaports in the colonies and known to the Indies and China, and then he began building houses for the great merchant ship owners. They were most substantial structures, the house itself one of a group of buildings, four-square and three stories in height, the whole surrounded by a massive fence. They differed from other homes of this general plan in their details, in their heavily ornamented entrance ways, hallways, staircases and room decorations, wherein the wood carver displayed his art in a manner that remains unsurpassed in this country.

His design entered into the Peirce house of 1779, and in 1780 he began the Derby house near the Derby wharf, and later the Boardman house on the Common, and the Forrester house. Meantime he was called upon to design other buildings such as the Assembly house and the court house in Salem, and in 1792 he submitted a design for the national Capitol. New influences were coming into American architecture in favor of more graceful forms, and McIntire did not hesitate to embody the new style in his plans, following after Bullfinch, and Adam in England, so that many of his later houses show less of massiveness and more of elegance. In the Read house he used carvings such as baskets of fruit and sprays of grapes which typify his methods of decoration. He displayed the new fashion in redesigning one of the Derby houses, the "Mansion," and carved many pieces for it from capitals to beading. As richly decorated was "Oak Hill" at Peabody, the home of a Derby daughter, the carvings here added to by McIntire's son Samuel after his death. Three of the rooms of this house have been transferred to the Boston Museum of Fine Arts and are described in a publication of the Museum. Decorations were also removed which are in the Pennsylvania Museum of Art.

His later houses were all built of brick, and included the Woodbridge and Tucker houses, and many carvings of his are found in other houses, not only as interior woodwork but in pieces of furniture bearing his characteristic ornaments of baskets, rosettes, eagles, the grape and laurel, and others used by him. Eagles he worked in on gateways, homes and large buildings, and some of these may be seen in the Essex Museum of Salem.

After his death it was said of him that all the improvements in Salem for thirty years had been under his eye. His son carried on carving, but died in 1819; and a brother, Joseph, and his son followed the art until the middle of the century. Consult Cousins and Riley, 'The Wood Carver of Salem' (1916); Swan, M. M. 'Samuel McIntire, Carver, etc.' (1934).

McINTOSH, Lachlan, American soldier: b. near Inverness, Scotland, 17 March 1725; d. Savannah, Ga., 20 Feb. 1806. He came with his father to Georgia in 1736, received there an ordinary English education, became a clerk in the mercantile establishment of Henry Laurens at Charleston, S. C., and was later employed as a land surveyor. At the opening of the Revolution he was made colonel of the 1st Georgia battalion, and became a brigadier-general in 1776. In 1777 he fought a duel with Button Gwinnett (q.v.), who was fatally wounded. In 1778 McIntosh was selected by Washington to lead a small force against the Western Indians, whom he subdued. In the siege of Savannah, 1779, he bore an active part. When Charleston surrendered to Sir Henry Clinton 12 May 1780, McIntosh was taken prisoner, and he never resumed his command. He was a member of the Continental Congress in 1784, and the next year as commissioner to the Indians he finished his public services.

MacINTOSH, William, a half-breed Creek chieftain, son of a Scottish trader: b. about 1780; d. 1 May 1825. In 1802 the United States undertook to extinguish the Indian titles to

lands within the borders of Georgia and in 1805 millions of acres of Creek lands were transferred to Georgia. The Creeks becoming alarmed at the prospect of being deprived of all their lands, on the motion of MacIntosh, now a chief, made a law in general council in 1811 forbidding the sale of any of the remaining land under penalty of death. MacIntosh led the Creek allies of the Americans in the War of 1812 with the rank of major and took the chief part in the massacre of 200 hostile Creeks at Atasi on 29 Nov. 1813. He also took part in the battle at Horseshoe Bend, Ala., 27 March 1814. More lands were acquired by treaty in 1818 and in 1821 another treaty was negotiated by the Georgians with MacIntosh, who was in the pay of the whites, and other chiefs controlled by him, while 36 chiefs refused to sign and demanded a general council. In 1824 about 10,000,000 acres still remained in the hands of the Creeks and in that year they re-enacted the law punishing with death any Creek who ceded land. In 1825 the whites, with bribes, induced MacIntosh and the chiefs under his control to sign a treaty ceding the remaining Creek lands. The treaty was approved by President Adams, but the Creeks did not rise in rebellion; they passed formal sentence of death on MacIntosh, which a party of warriors carried out.

MACK, Norman Edward, American politician and newspaper publisher: b. Buffalo, N. Y., 24 July 1858. He received a public school education, engaged in business and in 1879 established the *Buffalo Sunday Times.* In 1883 he began the publication of the *Daily Times,* of which he continued owner and editor. He was a delegate to the Democratic National Conventions from 1892, served as a member of the Democratic National Committee from 1900 and became its chairman in 1908. Died 26 Dec. 1932.

MACK VON LEIBERICH, Karl, Baron, Austrian military officer: b. Nennslingen, Bavaria, 24 Aug. 1752; d. Saint Polten, Austria, 22 Oct. 1828. He entered the army of Austria in 1770, and was in 1797 created field-marshal. After the peace of Campo Formio, he was appointed by the king of Naples to the command of his troops, and took the field against the French and occupied Rome; but a riot in Naples, caused by his having concluded an armistice with the French, forced him to take refuge in the French camp (1798). He was carried prisoner to Paris, but escaped in 1800 and in 1805 was sent to check the French advance alone the line of the Iller. But the enemy shut him up in Ulm, and on 17 October Mack capitulated with his army. He was tried by court-martial, but the sentence of death was commuted by the Austrian emperor to expulsion from the army and 20 years' imprisonment. In 1808 Mack was liberated, and in 1819 fully pardoned.

McKAY, măk-ī', **Alexander Charles,** Canadian educator: b. Beamsville, Ontario, 2 June 1861. He was educated at the universities of Toronto and Cambridge, England. He became professor of mathematics and physics at McMaster University in 1890, later holding the offices of dean of arts and registrar, and in 1905 he was elected chancellor of the university. After 1911 he was the principal of the New Technical School, Toronto. He collaborated in the preparation of mathematical textbooks.

MACKAY, mą-kā' or mą-kī, **Charles,** English poet, journalist and miscellaneous writer: b. Perth, Scotland, 27 March 1814; d. London, 24 Dec. 1889. He was editor of the *Illustrated London News,* 1852–59, lectured in the United States, 1857–58, and was a special correspondent of the London *Times* in New York during the Civil War (1862–65). He was famous for his songs, many of which he set to music of his own. 'Cheer, Boys, Cheer,' is the best known of these.

MACKAY, Clarence Hungerford, American capitalist: b. San Francisco, 17 April 1874; d. New York, 12 Nov. 1938. The son of J. W. Mackay (q.v.), he succeeded on the death of his father to his vast business interests. Much of his boyhood was spent in France, and he was educated in Vaugirard College, afterward studying at Beaumont College, Windsor, England. He was chairman of the Commercial Cable Company, the Postal Telegraph-Cable Company, the Commercial Pacific Cable Company, the Mackay Companies, the Commercial Cable Building Company, the Postal Telegraph Building Company and the Commercial Cable Company of Cuba. He was also a director of the North American Telegraph Company and the Metropolitan Opera Company. He was one of the prime movers to raise funds for the purchase of the log cabin in which Abraham Lincoln was born.

McKAY, Donald, American shipbuilder: b. Nova Scotia, 1810; d. 1880. He went to New York and learned shipbuilding, and began the business at Newburyport, Mass. At East Boston, in 1845, he established a shipyard where he built many large trading ships of the clipper model, in which he made great improvements. The *Great Republic,* which he built in 1853, a ship of 4,500 tonnage, was a larger vessel than had ever before been seen.

MACKAY, George Eric, English poet, son of Charles Mackay (q.v.): b. London, 25 Jan. 1851; d. 2 June 1898. Among his works are 'Songs of Love and Death' (1865); 'Ad Reginam' (1881); the popular 'Love Letters of a Violinist' (1886); 'A Lover's Litanies' (1888); 'Nero and Actæa,' a tragedy (1891); 'My Lady of Dreams' (1895); 'Arrows of Song' (3d ed., 1896); 'A Lover's Missal' (1898).

McKAY, Gordon, American inventor and manufacturer: b. Pittsfield, Mass., 1821; d. Newport, R. I., 19 Oct. 1903. He was the son of a cotton manufacturer, and at 12, on the death of his father, learned civil engineering, at which he worked for some time. Before he was 21 he built a machine-shop in Pittsfield which employed 100 men, and later became treasurer and manager of the Lawrence Machine Company. He was the first successful inventor of machinery for making boots and shoes; he perfected a shoe sewing-machine, invented, but not made practicable, by L. R. Blake, of Abington, Mass.; afterward invented the heeler, lasting-machine, nailing-machine, etc., which came into general use; and by these inventions revolutionized the boot and shoe industry of the world. At the outbreak of the Civil War he offered to make the shoes for the Union army, and within three years had leased his

machines to more than 60 firms, and shortly became a millionaire. In 1878 he formed the McKay Sewing-Machine Association, a strict monopoly which exacted commissions on all shoes made in the United States by the aid of his inventions, and also brought profit through European royalties. In 1893 he placed $4,000,000 in a trust fund for Harvard University. He made many other liberal donations for benevolent and educational objects, and established near Kingston, R. I., the McKay Institute for the manual training of colored youth. By his will the greater part of his estate was left to Harvard.

MacKAY, Jessie, Australian poet and prose writer: b. Cambridge, New Zealand, 15 Dec. 1864. She combined teaching with literary work and has been a voluminous contributor to the Australian press, with the readers of which she is a favorite. Among her published works are 'The Spirit of the Rangatira and Other Ballads' (1810); 'The Sitter on the Rail and Other Poems' (1891); 'The Bride of the Rivers.'

MACKAY, John William, American capitalist: b. Dublin, Ireland, 28 Nov. 1831; d. London, 20 July 1902. His parents brought him to New York in 1840, and he learned shipbuilding. He went to California as a miner in 1851, and afterward to Nevada, where he continued mining with great perseverance in the face of many disappointments. In 1872 he was one of the discoverers of the Bonanza mines of the Comstock Lode (q.v.), in which mines he obtained a two-fifths share and became very wealthy. He and his partners, Fair, Flood and O'Brien, founded the Bank of Nevada, of which Mackay was president for years. His relations with Jay Gould being unfriendly, in a spirit of opposition to him, and to the Western Union Telegraph Company, Mackay in 1884 joined with James Gordon Bennett in forming the Commercial Cable Company and the Postal Telegraph Company. He succeeded in laying two cables, overcoming great obstacles, and afterward won in a long rate-war with the old lines. The Roman Catholic Orphan Asylum at Virginia City, Nev., founded by him, is noteworthy among his many public benefactions.

MACKAYE, mą-kī', **James Steele,** American playwright: b. Buffalo, N. Y., 1844; d. Timpas, Colo., 25 Feb. 1894. In 1868 he went to Paris to study painting; but having there met Delsarte (q.v.) became interested in the latter's theories, and studied dramatic expression. In 1870–71 he gave in New York and Boston lectures on the art of expression. He opened the Saint James Theatre at New York in 1872, and appeared there in 'Monaldi,' adapted by himself from the French. In 1873–75 he was studying the drama in Paris and England, and at the Crystal Palace, London, he played the title-rôle in 'Hamlet.' His adaptation of Blum's 'Rose Michel' in 1872 ran for 122 nights at the Union Square Theatre, New York. He established in New York the Lyceum School of Acting, which later became the American Academy of Dramatic Arts. For several years he was manager of the Madison Square Theatre, and in 1885 built the Lyceum. Among his further plays were 'Won at Last'; 'Through the Dark'; 'Hazel Kirke'; 'A Fool's Errand'; 'In Spite of All'; 'Paul Kauvar.' Consult Mackaye, Percy, 'Steele Mackaye: A Memoir' (New York 1911).

MACKAYE, Percy, American dramatist and poet: b. New York, 16 March 1875. He was graduated from Harvard in 1897 and studied at the University of Leipzig in 1899–1900. He engaged in European travel in 1898–1900, residing in Rome, Switzerland, Leipzig and London. He was an instructor in a private school in New York in 1900–04, after which time he joined the Cornish Colony in New Hampshire and devoted his time entirely to dramatic work. He has lectured on the theatre at Harvard, Yale, Columbia and other American universities, and is a member of the National Institute of Arts and Letters. He is a leading exponent of poetic dramatic art in America and handles both tragedy and comedy with grace and surety of touch. Author of 'The Canterbury Pilgrims,' a comedy, produced by the Coburn Players in the open air at Harvard, Yale and other universities in 1909–13, and given as a civic pageant in honor of President Taft at Gloucester, Mass., 4 Aug. 1909 (1903); 'A Modern Rendering into Prose of Chaucer's Tales' (1904); 'Fenris the Wolf,' a tragedy (1905); 'Jeanne d'Arc,' a tragedy, produced by Julia Marlowe and E. H. Sothern in America and England in 1906–07 (1906); 'Sappho and Phaon,' a tragedy (1907); 'The Scarecrow' (1908); 'Lincoln Centenary Ode' (1909); 'Mater,' an American comedy (1908); 'The Playhouse and the Play,' essays (1909); 'A Garland to Sylvia' (1910); 'Anti-Matrimony,' a satirical comedy produced and acted by Henrietta Crossman (1910); 'The Civic Theatre' (1912); 'Uriel and Other Poems' (1912); 'Beauty and the Beast,' a lyric drama (1912); 'Sanctuary, A Bird Masque,' produced for President Wilson at Meriden Bird Club Sanctuary, New Hampshire (1913); 'The Immigrants,' a lyric drama (1915); 'The Evergreen Masque' (1917); 'This Fine Pretty World'; 'The Sphinx' (1929).

McKEAN, mą-kēn', **Thomas,** American patriot and jurist, signer of the Declaration of Independence: b. New London, Chester County, Pa., 19 March 1734; d. Philadelphia, 24 June 1817. He was privately educated at Newcastle, Del.; having settled there, he studied law and was admitted to the bar in 1755, at once became register of probate and was soon made assistant attorney for Sussex County. With Cæsar Rodney (q.v.), in 1762, he entered upon a revision of Delaware laws up to 1752, and was chosen in the same year to the Delaware assembly, in which his membership continued till 1779. Elected in 1765 to the Stamp Act Congress, he took a strong position in defense of colonial rights and as judge of the Common Pleas in the same year permitted no stamped paper to be used in his court. About 1771 he began to practise law in Philadelphia, although retaining a Delaware residence, and from Delaware, in 1774, he was elected to the Continental Congress, in which he served nine years, including the entire period of the Revolution, and took a prominent part in its proceedings, being president of the Congress in 1781. He was not present at the signing of the Declaration of Independence, which he had advocated, but added his signature some years afterward. The

Articles of Confederation were also signed by him. From September to November 1777, he served as acting president of Delaware, and from 1777 to 1799 as chief justice of Pennsylvania. As a member of the state convention in 1787, he played an active part in securing Pennsylvania's ratification of the Constitution. McKean became a strong supporter of Thomas Jefferson and a leader of the Republican Party of that day. From 1799 to 1808 he served as governor of Pennsylvania. With James Wilson he wrote *Commentaries on the Constitution of the United States of America* (1792).

McKEES ROCKS, borough, Pennsylvania, situated in Allegheny County, on the Ohio River at the mouth of Chartiers Creek, 4 miles northwest of the center of Pittsburgh, of which it is an industrial suburb. It is served by the Pittsburgh & Lake Erie, the Pittsburgh, Chartiers & Youghiogheny, and the Pittsburgh, Allegheny McKees Rocks railroads. There are bituminous coal mines nearby. The borough has railroad shops and industrial establishments producing iron and steel, locomotive parts, chemicals, paint, and enamelware.

McKees Rocks is on the site of a trading post established in 1743, and of a fort built by Christopher Gist (q.v.) in 1753. It was named for Alexander McKee, who acquired the land and settled here about 1764. It was incorporated as a borough in 1892. Government is by mayor and council. Pop. (1950) 16,241.

McKEESPORT, city, Pennsylvania, situated in Allegheny County, at an altitude of 750 feet, at the confluence of the Monongahela and Youghiogheny rivers and on their east banks, 10 miles southeast of Pittsburgh. It is served by the Pennsylvania, the Baltimore & Ohio, the Pittsburgh & Lake Erie, and the McKeesport Connecting railroads. The city is laid out on ground rising fairly steeply from the riverbanks, with the newer residential section on heights overlooking the business and industrial districts. McKeesport is the retail center of a thickly settled area, its neighboring towns including Clairton, East McKeesport, Glassport, Duquesne, Elizabeth, Wilmerding, Port Vue, and East Pittsburgh. The city's industrial history is closely associated with the development of the surrounding bituminous coal and natural gas region. McKeesport is one of the world's largest producers of steel pipe and tubing, and is sometimes called the Tube City. It also has important sheet steel and tin plate industries, and is the home of the first United States producers of stainless steel. Among the other products of the city's industrial establishments are shell and tool steel, steel castings, fabricated steel, structural steel products, chromium sheets, automobile wheels and bodies, tools and dies, cans, candy, meat products, and lumber. The city's public school system includes two high schools, and there is a Carnegie free library.

McKeesport was settled in 1755 by David McKee, a native of Ireland, who purchased a tract of 844 acres and from 1769 operated a ferry for which official authority was granted in 1775. The area was the center of the Whiskey Rebellion (q.v.) in 1794. The town was laid out in 1795 by John McKee, son of the original settler, 200 city lots being platted and sold. Growth was slow until about 1830, when the rich coalfields nearby were opened. Until the 1850's barge building was a thriving industry. The first ironworks was established in 1851, and industrial expansion was steady thereafter. McKeesport was incorporated as a borough in 1842, and chartered as a city in 1890. Government is of the commission type. Pop. (1950) 51,502.

McKEEVER, William Arch, American educator and author: b. Jackson County, Kans., April 12, 1868; d. July 8, 1940. He was graduated from the University of Kansas in 1898, and later studied at the University of Chicago and Harvard University. From 1900 to 1913 he taught philosophy at Kansas State Agricultural College, and from 1913 to 1920 was head of the department of child welfare at the University of Kansas. He then became director of the School of Psychology, Oklahoma City. He was the author of *Psychology and the Higher Life* (1908); *Psychologic Method in Teaching* (1909); *Farm Boys and Girls* (1912); *Training the Boy* (1913); *Training the Girl* (1914); *Outlines of Child Study* (1915); *The Child and the Home* (1923); *The Creative Mind* (1925); *You and Your Life* (1930); and *Living a Century* (1935).

McKELL, Sir William John, Australian statesman: b. Pambula, New South Wales, Sept. 26, 1891. From 1917 to 1947 he was a Labour member of the Legislative Assembly of New South Wales. He served as minister of justice of the state from 1920 to 1922 and again from 1925 to 1927, minister for local government from 1930 to 1931, minister of justice from 1931 to 1932, and prime minister from 1941 to 1947, when he was appointed governor general of Australia. He was knighted in 1951. Field Marshal Sir William Slim succeeded him in the governor generalship early in 1953.

MacKELLAR, Thomas, American printer, type founder, and poet: b. New York City, Aug. 12, 1812; d. Dec. 29, 1899. He went to work as a compositor at the age of 14, and in the following year was employed by the publishing house of John and James Harper, where he learned the printer's trade. Shortly before he was 21, he went to Philadelphia and became a proofreader in the type foundry of Lawrence Johnson and George F. Smith. In 1845 he became a partner in the firm, and in 1860 the head of its successor, MacKellar, Smiths & Jordan, which he developed into the leading type foundry in the United States. From 1855 to 1884 he edited the *Typographic Advertiser*. He was the author of a popular work on typography, *The American Printer* (1866), as well as of a number of volumes of poetry. Among the latter are *Droppings from the Heart* (1844); *Tam's Fortnight Ramble* (1847); *Rhymes Atween-Times* (1873).

McKELWAY, Saint Clair, American journalist: b. Columbia, Mo., March 15, 1845; d. July 16, 1915. In 1853 his family moved to New Jersey, where he was privately educated. He studied law and was admitted to the New York bar in 1866, but never practiced. In that year he joined the staff of the New York *World,* and from 1868 to 1870 was Washington correspondent of that paper and the Brooklyn *Daily Eagle.* He was a member of the editorial staff of the *Eagle* until 1878, when he became editor of the Albany *Argus.* In 1884 he became editor in chief of the *Eagle,*

which under his editorship maintained a high standard of excellence. He was a regent of the University of the State of New York since 1883, becoming vice-chancellor in 1900 and chancellor in 1913, a member of the historical societies of Long Island and Suffolk County, was director of the American Social Science Association and has lectured frequently on educational and political subjects.

McKENDREE, mą-kĕn'drĭ, **William,** American Methodist bishop: b. King William County, Va., 6 July 1757; d. near Nashville, Tenn., 5 March 1835. He served in the Continental army during the American Revolution, entered the Methodist ministry in 1787 and became a presiding elder nine years later. In 1801 he made a missionary tour beyond the Alleghanies and was an important factor in the evangelizing of that region. In 1808 he was elected bishop, being the first American-born person to hold that office in the Methodist Church. McKendree College (q.v.) was named in his honor. Consult 'Life' by Paine (1869).

McKENDREE COLLEGE, in Lebanon, Ill., founded in 1828 under the auspices of the Methodist Episcopal Church and first called Lebanon Seminary. In 1830 the name was changed, in honor of William McKendree, who gave his estate to the college. In 1839 a new charter was obtained whereby the school was granted university privileges. Abraham Lincoln rendered valuable services in securing the new charter. Students are admitted on certificates from approved schools or on examinations. It has classical, scientific, music, pre-law and pre-medical courses. Two main degrees are given: A.B. and B.S. In normal enrolment years it has approximately about 180 men and women in the regular session.

McKENNA, mă-kĕn'ą, **James Andrew Joseph,** Canadian public service commissioner: b. Charlottetown, Prince Edward Island, 1 Jan. 1862. He was educated at Saint Dunstan's College, Charlottetown, was associated for a time with the Prince Edward Island Railway and afterward engaged in journalism. In 1886 he entered the Indian Department of the Dominion Civil Service; and for a brief period was private secretary to Sir John A. Macdonald. With T. G. Rothwell he effected a settlement with British Columbia concerning the administration of the railway belt lands in 1897, and in 1899 he was a royal commissioner for the negotiation of a treaty with the Indians whereby the Peace River and Athabaska Country were surrendered to the Crown. He likewise secured the surrender by the Indians of the country around Buffalo Lake, Churchill River and Reindeer Lake in 1906. He was chairman of the royal commission which was appointed to adjust the claims of the half-breeds of the Northwest, and in 1901 was the sole commissioner. After 1909 he served as inspector of Indian Catholic schools in Manitoba, Keewatin and the Northwest provinces and territories. Author of 'Sir John Thompson' (1895), and 'The Hudson Bay Route' (1907). Died 30 May 1919.

McKENNA, Joseph, American jurist: b. Philadelphia, 10 Aug. 1843. In 1855 he went to California and was graduated from the Benicia Collegiate Institute in 1865, and admitted to the bar the same year. He was district attorney of Solano County in 1866–68, and in the sessions of 1875 and 1876 served as a Republican in the lower house of the California legislature. In 1885–93 he was a California representative in the 49th, 50th, 51st and 52d Congresses, resigning from the House in 1893 to accept the appointment to the office of United States circuit judge in the Ninth Federal judicial district. This post he resigned to become Attorney-General in the cabinet of President McKinley in 1897. On 16 Dec. 1897 he was made an associate justice of the United States Supreme Court; took his seat, 26 Jan. 1898; retired, 5 Jan. 1925. He died 21 Nov. 1926.

McKENNA, Reginald, English statesman: b. London, 6 July 1863. He was educated at King's College, London, and at Trinity Hall, Cambridge, and became a barrister in 1887. He engaged in law practice until his election to Parliament for North Monmouthshire by the Liberal party in 1895. He soon acquired a reputation as one of the hardest workers on the Liberal benches as well as for a sound knowledge of national finance and of parliamentary procedure. In the cabinet of Sir Henry Campbell-Bannerman, formed in 1905, McKenna was appointed Financial Secretary under Chancellor of the Exchequer Asquith. In 1907 he received cabinet place as president of the Board of Education. He instituted medical inspection of the children in the schools, and reorganized the secondary school system. When the Asquith cabinet was organized in 1908 he was appointed First Lord of the Admiralty, and in 1911 he was transferred to the office of Home Secretary, where the problems incident to the crusades of the militant suffragettes caused him considerable difficulty. The so-called "Cat-and-Mouse Act" brought severe criticism from the supporters of the suffrage movement and from the Opposition. He was also prominently connected with the Welsh Church Bill, the Mental Deficiency Act and the affairs of the Administration of Criminal Justice. Upon the formation of the coalition cabinet under Asquith, in May 1915, McKenna became Chancellor of the Exchequer, succeeding Lloyd George, who was appointed to the new post of Minister of Munitions. McKenna introduced the first heavy war-tax measure and elicited high praise upon its brevity and lucidity as well as its careful distribution of the burdens of taxation. When the new coalition cabinet was organized under the premiership of Lloyd George, December 1916, McKenna was succeeded by Bonar Law. In the elections of 1918 he lost his re-election from North Monmouthshire, interrupting a continuous Parliamentary career of 23 years. In 1919 he abandoned politics and devoted the remainder of his life to banking, becoming chairman of the Midland Bank, one of the strongest financial institutions in England. In 1924 he served as a member of the so-called Dawes Plan Commission. He died at London, 6 Sept. 1943.

MACKENSEN, August von, German field-marshal: b. Hausleipnitz, Saxony, 1849. Entering the army in 1869 he served as lieutenant of reserves in the Franco-Prussian War. In 1876 he became adjutant of the first cavalry brigade and two years later was made lieutenant-colonel. He was appointed to the general staff in 1882 and in 1894 became commander of the Life Hussars

Regiment and the following year was made aide-de-camp to the emperor. In 1914 he was made chief-of-staff under von Hindenburg on the Eastern Front and in 1915 he directed the German drive in the Balkans and was made field-marshal. He commanded the German right in the drive on Warsaw and forced the Russian evacuation of that city. In 1916 he subjugated Rumania in conjunction with von Falkenhayn. After the Armistice, he was interned by the French at Neusatz, where, over the protests of the Germans, he was kept until 1919.

MACKENZIE, ma-kĕn'zĭ, Sir **Alexander,** Canadian explorer: b. Stornoway, Scotland, 1763; d. Mulnain, Perth, 12 March 1820. He went to Canada and in 1789 explored the great river named after him from the western end of Great Slave Lake to the Arctic Ocean, made another expedition to the western coast (1792), and was the first white man to cross the Rocky Mountains and reach the Pacific Coast. He returned to Britain in 1801, and was knighted in 1802. He published 'Voyages from Montreal through the Continent of North America to the Frozen and Pacific Oceans in 1789 and 1793' (1801).

MACKENZIE, Alexander, Canadian statesman: b. Logierait, Perthshire, Scotland, 28 Jan. 1822; d. Toronto, Ontario, 17 April 1892. He emigrated to Canada in 1842. For five years he worked at the trade of a stonemason at Kingston, but then removed to Sarnia, where he became a contractor. But his chief interests were political, not commercial. In 1852 he began the publication of the Lambton *Shield,* and soon became conspicuous as one of the Liberal leaders. He entered the Canadian Parliament in 1861, and after the Confederation of Canada, in 1867, sat both in the Ontario legislature at Toronto and in the Dominion Parliament at Ottawa. When Edward Blake (q.v.) became Prime Minister of Ontario in 1871 Mackenzie joined his cabinet and became Provincial Treasurer, but in consequence of the passing of a law forbidding membership of more than one legislature, he elected in 1872 to sit in the Dominion Parliament. In 1873, when the government of Sir John Macdonald was overthrown, Mackenzie, now the leader of the Liberal party, became Prime Minister of Canada and held office for five years. His too great devotion to the details of his office broke down his health. In 1878 his government was defeated by the advocates of protection, and in 1880 he was obliged by ill-health to hand over the leadership of the Liberal party to Mr. Blake.

MACKENZIE, Sir **Alexander Campbell,** Scottish composer: b. Edinburgh, 22 Aug. 1847. He received his musical education at Sondershausen, Germany, and at the Royal Academy of Music, London, where he won the King's Scholarship in 1862. He established himself as a teacher in Edinburgh in 1865 and soon became known as a violinist of merit. He became precentor of Saint George's Church in 1870 and was appointed conductor of the Scottish Vocal Music Association in 1873. He was a member of the orchestra at the Birmingham Festivals in 1864–73. He had composed several notable pieces for the piano at this time, and at the solicitation of friends he abandoned his work as a teacher and settled in Florence where he spent the greater share of his time from 1875 to 1885 engaged in composition. From 1888 he was principal of the Royal Academy of Music. He conducted the Philharmonic concerts in 1892–99, and was knighted in 1894. Author of 'Overture, Cervantes'; the cantatas 'The Bride' (1881) and 'Jason' (1882); the operas 'Colombo' (1883); 'The Troubadour' (1886); the oratorios 'The Rose of Sharon' (1884); 'Bethlehem' (1894); incidental music for several plays among them 'The Little Minister,' 'Coriolanus' and 'Ravenswood,' and many concertos, songs, violin pieces and works for violin and orchestra. Died 28 April 1935.

MACKENZIE, Alexander Slidell (originally Slidell), American naval officer: b. New York, 6 April 1803; d. Tarrytown, N. Y., 13 Sept. 1848. He was a brother of John Slidell (q.v.) and assumed the name "Mackenzie" for an uncle in 1837. He entered the navy in 1815 and became a commander in 1841. While in command of the *Somers* the next year a mutiny among the naval apprentices on board was supposed to have been detected, and three of them, including a son of the Secretary of War, were hung from the yardarm on 1 Dec. 1842. He was a popular writer and among his works are 'A Year in Spain by a Young American' (1829–31; enlarged ed., 1836), which attained great popularity in England and the United States; 'Popular Essays on Naval Subjects' (1833); 'The American in England' (1835); 'Life of John Paul Jones' (1841), etc. Consult 'The Case of the Somers: Defense of A. S. Mackenzie' (New York 1843); Cooper, 'The Cruise of the Somers' (ib. 1844).

MACKENZIE, Arthur Stanley, Canadian educator: b. Pictou, Nova Scotia, 26 Sept. 1865. He was graduated at Dalhousie University in 1885, and in 1885–87 was assistant master at the Yarmouth Academy, Nova Scotia. He was scholar in physics at Johns Hopkins University in 1889–90 and Fellow there in 1890–91. He was connected with the staff of physics at Bryn Mawr College in 1891–1905, was professor of physics at Dalhousie University in 1905–10 and at Stevens Institute of Technology in 1910–11, after which he was president of Dalhousie University. Author of 'The Laws of Gravitation' (1900). Died Halifax, 2 Oct. 1938.

MACKENZIE, Charles Frederick, Anglican bishop: b. Portmore, Peebleshire, Scotland, 10 April 1825; d. Malo, in the Manganja country, Africa, 31 Jan. 1862. He was graduated at Cambridge in 1848, was elected a Fellow there and was ordained a deacon in 1851. He was appointed to a curacy at Haslingfield, Cambridgeshire, in 1851, which office he filled without discontinuing his work as Fellow and tutor at Cambridge. In December 1854 he accompanied Bishop Colenzo to Natal as his archdeacon, and returned to England after a severe illness in 1859. He became the head of the Universities' Mission to Central Africa in 1860 and in 1861 was consecrated bishop of Central Africa. He was assisted by Livingstone in penetrating certain remote districts in his diocese. He died of a fever while on his way to a conference with the explorer. Consult Goodwin, 'Memoir of Bishop Mackenzie' (2d ed., 1865); Livingstone, 'Narrative of an Expedition to the Zambeezi' (pp. 348–364, 400, 410–412, 1865).

MACKENZIE, Compton, English novelist and playwright: b. West Hartlepool, 17 Jan. 1883. He was educated at Saint Paul's School and Magdalen College, Oxford, where he took the second class in modern history in 1904. He was one of the founders of the Oxford *Point of View,* and was its editor from 1902 to 1904. He has since occupied himself in writing novels and plays. He holds a commission as a lieutenant in Royal Marines. His chief publications are 'The Passionate Elopement' (1911); 'Carnival' (1912); 'Guy and Pauline' (1915); 'Poor Relations' (1919); 'The Seven Ages of Woman' (1922); 'The Heavenly Ladder' (1924); 'The Old Men of the Sea' (1924); 'Coral' (1925); 'Fairy Gold' (1926); 'Rogues and Vagabonds' (1926); 'Dreams to Sell' (1930).

MACKENZIE, Sir George, Scottish lawyer: b. Dundee, 1636; d. Westminster, 8 May 1691. He was a grandson of Kenneth, 1st Lord Mackenzie of Kintail, and a nephew of the 1st and 2d Earls of Seaforth. He was educated at the universities of Saint Andrew's and Aberdeen and later studied civil law at the University of Bourges, France. He was called to the bar in Scotland in 1659 and speedily rose to distinction. In 1661 he conducted the defense for the Marquis of Argyll in his trial for high treason, and soon afterward was appointed a justice-depute, or judge of the Criminal Court. In 1669 he sat for Ross-shire and rendered himself conspicuous by his opposition to Lauderdale and by his support of popular measures. He was knighted in 1674 and in 1677 succeeded Sir John Nisbet as King's Advocate. From this time Mackenzie's principles seemed wholly subverted, and in his endeavor to force submission to the king he earned for himself the appellations «Bloody Mackenzie» and «the bloodthirsty advocate.» He opposed the abrogation of the penal laws against Catholics in 1686 and was removed from office until 1688, when for a year he was again King's Advocate, relinquishing the office at the outbreak of the Revolution. He founded the Advocate's Library at Edinburgh in 1689, and in 1690 he retired to Oxford where he was admitted as a student and spent the remainder of his life engaged in literary pursuits. Author of 'A Vindication of the Government of Charles II' (1691); 'The Moral History of Frugality' (1691); 'Methods of Proceeding against Criminals and Fanatical Covenanters' (1691); 'Vindication of the Presbyterians of Scotland from the Malicious Aspersions Cast upon Them' (1692), and many other works of earlier date. His collected works were published (2 vols., Edinburgh 1716–22).

MACKENZIE, George Henry, American chess player: b. near Aberdeen, Scotland, 24 March 1837; d. New York, 13 or 14 April 1891. He was appointed an ensign in the 60th Rifles in 1856, served at the Cape of Good Hope and in India and was promoted lieutenant. He returned to England and in 1861 sold his commission. He came to the United States in 1863, joined the Federal army and rose to the rank of captain. He thereafter devoted himself to chess as a professional, already having won first prize in the London Tournament of 1862, defeating the Prussian champion, Anderson. Settling in New York in 1865 he became a member of its chess club and won first prize in the tournaments of 1865, 1866, 1867, 1868. He won first prize at the Second American Chess Congress in Cleveland in 1871; fourth prize at the International Congress at Paris in 1878, and in 1887 he won the championship of the world at Frankfort. He was found dead in bed.

MACKENZIE, Henry, Scottish novelist and essayist: b. Edinburgh, 25 Aug. 1745; d. there, 14 Jan. 1831. He was a lawyer at Edinburgh, and in 1771 published anonymously 'The Man of Feeling,' which the booksellers had declined as a gratuitous offering, and which gained him a conspicuous place among 18th century writers. Other novels of his are 'Man of the World' (1773), and 'Julia de Roubigné' (1777). He edited *The Mirror,* 1779–80 (the first Scottish paper founded on the plan of *The Spectator*), and *The Lounger,* 1785–87.

MACKENZIE, James Cameron, American educator: b. Aberdeen, Scotland, 15 Aug. 1852. He was graduated at Princeton Theological Seminary in 1882 and was ordained in the Presbyterian ministry in 1885. He founded the Harry Hillman Academy, Wilkes-Barre, Pa., in 1882, and also organized the Lawrenceville (N. J.) School in that year, acting as its head master in 1882–99. In 1899 he reorganized the Jacob Tome Institute, Fort Deposit, Md., and was its director until 1901. In 1901–26 he was director of the Mackenzie School, Monroe, N. Y., and after that engaged in literary work. D. 10 May 1931.

MACKENZIE, John Joseph, Canadian pathologist and bacteriologist: b. Saint Thomas, province of Quebec, 1865; d. 1 Aug. 1922. He was educated at the universities of Toronto, Leipzig and Berlin. He was a Fellow in biology at Toronto and later was bacteriologist to the Ontario Provincial Board of Health. After 1900 he was professor of pathology and bacteriology at the University of Toronto. He contributed to various scientific magazines. He was a Fellow of the Royal Society of Canada, and member of the American Public Health Association, the Society of American Bacteriologists and of the American Association of Pathologists and Bacteriologists. He was secretary of the Canadian Institute. During the European War he was attached to No. 4 Canadian General Hospital. Author of 'Recent Theories in Regard to the Causes of Immunity to Infectious Disease' (1907).

MACKENZIE, John Stuart, British educator: b. near Glasgow, 21 Feb. 1860. He was educated at Glasgow and Cambridge universities and later studied at the University of Berlin. He was a Fellow at the University of Glasgow in 1882–84, at the University of Edinburgh in 1884–89 and at Trinity College, Cambridge, 1890–96. He was professor of logic and philosophy at the University College of South Wales and Monmouthshire in 1895–1915, then becoming professor emeritus. He was a vice-president of the Institut International de Socialogie in 1911 and president of the Moral Education League in 1908–16. Besides magazine articles and contributions to the 'Encyclopedia of Religion and Ethics' he is author of 'An Introduction to Social Philosophy' (1890; 2d ed., 1895); 'A Manual of Ethics' (1893; 8th ed., 1915); 'Outlines of Metaphysics' (1902; 2d ed.,1906); 'Elements of Constructive Philosophy' (1917); 'Ultimate Values' (1924).

MACKENZIE, Sir **Morell,** English laryngologist: b. Leytonstone, Essex, 7 July 1837; d. London, 3 Feb. 1892. He was educated at the London Hospital, Paris and Vienna. In 1859 he met Czermak in Budapest and learning from him the use of the laryngoscope he introduced its use into London. Later he became physician to the London Hospital and lecturer on diseases of the throat. In 1863 he founded the Throat Hospital in London. In 1887–88 he was associated with specialists of Berlin and Vienna in the treatment of the larynx disease of the Crown Prince, subsequently Emperor Frederick of Germany, and for these services was knighted by Queen Victoria and received the Grand Cross and Star of the Hohenzollern Order of Germany. He was the author of 'The Use of the Laryngoscope' (1866); 'Diseases of the Throat and Nose' (1880), etc.

MACKENZIE, Ranald Slidell, American soldier: b. New York City, 27 July 1840; d. Staten Island, N. Y., 19 Jan. 1889. He was son of Alexander S. Mackenzie (q.v.). Graduated from West Point in 1862, he was assigned to the engineer corps, was wounded at Manassas and brevetted 1st lieutenant for services in that action. He was engineer of Sumner's division at Fredericksburg (13 Dec. 1862), and received the successive brevets of captain and major for his conduct at Chancellorsville and Gettysburg. Promoted captain of engineers 6 Nov. 1863, he took part in the Richmond campaign as commander of 2d Connecticut Artillery. On 18 June 1864 was brevetted lieutenant-coloned and commanded the 2d Connecticut Heavy Artillery in the Shenandoah campaign. Present at Appomattox (9 April 1865), mustered out of the volunteer service 15 Jan. 1866. After the Civil War he commanded important army posts in the Southwest, and was notably successful in settling Indian troubles on the Rio Grande. Made brigadier-general 1882, retired for disabilities 1884.

McKENZIE, Robert Tait, American sculptor, educator and physician: b. Almonte, Ont., Canada, 1867; d. Philadelphia, Pa., 28 April 1938. He was graduated at McGill University in 1889 and took his M.D. there in 1892. He engaged in the practice of medicine; was connected with the medical faculty of McGill in 1895–1904, and in 1904 was appointed professor and director of the department of physical education at the University of Pennsylvania. He was appointed temporary major in the R. A. M. C. in 1915, and in 1916 was inspector of physical training of Kitchener's armies, and medical officer in charge of Heaton Park Command Depot. He was a fellow of the College of Physicians at Philadelphia, and in 1912–15 he was president of the American Physical Education Association. His fame as a sculptor was achieved without artistic training, his guide being his thorough knowledge of anatomy and his unusual ability in interpretation. He exhibited at the Society of American Artists, New York; the Royal Academy, London, and the Paris Salon. Among his works as a sculptor are 'The Sprinter' (Fitzwilliam Museum, Cambridge); 'The Athlete' (Ashmolean Museum, Oxford); the statuettes, 'The Competitor' and the 'Juggler' (Metropolitan Museum, New York); 'The Youth Benjamin Franklin' (University of Pennsylvania). Author of 'The Barnjum Barbell Drill,' 'Exercise in Education and Medicine,' 'Reclaiming the Maimed.'

MACKENZIE, Sir **William,** Canadian financier: b. Kirksfield, Ontario, 30 Oct. 1849; d. Toronto, 5 Dec. 1923. He was educated at the local schools and became a public school teacher. Giving up this occupation he contracted for the construction of a portion of the Victoria Railway — now the Midland division of the Grand Trunk Railway — and later executed contracts for the Coboconk, the Credit Valley, the Canadian Pacific, the Fort McLeod and Edmonton, the Regina, the Hudson Bay and Dauphin railways and other roads. He controlled and was president of the Toronto Street Railway, was also interested in the Montreal and Winnipeg street railways, and with others controlled the Birmingham Street Railway and other European lines. His great achievement was the construction of the Canadian Northern Railway. He was knighted in 1911.

MACKENZIE, William Douglas, American Congregational clergyman: b. Fauresmith, Orange River Colony, South Africa, 16 July 1859. He graduated from Edinburgh University in 1881, studied divinity in Edinburgh and Göttingen, was professor of theology in the Chicago Theological Seminary, 1895–1903, and since 1903 has been president of Hartford Theological Seminary. He published 'The Revelation of the Christ' (1896); 'Christianity and the Progress of Man' (1897); 'South Africa: its History, Heroes and Wars' (1900); 'John Mackenzie, South African Missionary and Statesman' (1902); 'The Final Faith' (1910); 'Galatians and Romans' (1912); 'Christian Ethics in the World War' (1918).

MACKENZIE, William Lyon, Canadian journalist and political reformer: b. Dundee, Scotland, 12 March 1795; d. Toronto, Ontario, 28 Aug. 1861. In 1820 he came to Canada and conducted a drug and book store at Little York (now Toronto), and later at Queenstown, where in 1824–26 he published the *Colonial Advocate.* He transferred the *Advocate* office to Toronto in 1826, and there continued the paper until 1833, attacking the office-holding class and demanding governmental reforms. In 1828 he entered the provincial Parliament; and having been expelled for alleged libel against that assembly, was five times re-elected and as often re-expelled, until the government refused to issue another writ of election. In 1832 he went to England, and having presented to the home government a petition of grievances from the Canadian reformers, was successful in obtaining the dismissal of the attorney-general and the solicitor-general of Upper Canada and the veto of the Upper Canadian bank bill. In 1834 he was elected first mayor of Toronto, in 1836 began the publication of *The Constitution,* and, in 1837 published in that journal a bold manifesto which was practically a declaration of independence of the provincial government. Soon afterward he was the moving spirit in armed rebellion. An encounter took place between his followers and the government forces at Montgomery's Tavern, in the vicinity of Toronto (7 Dec. 1837), and the insurgents fled to Navy Island in the Niagara, where they were joined by about 500 Americans. The island was bombarded by Canadian troops, and as a result of this and the strong opposition of General Scott of the United States army, the insurgents broke camp and Mackenzie was im-

prisoned for a year in Rochester jail. Later he was a journalist in the United States, in 1849 took advantage of amnesty to return to Canada, was there a member of Parliament from 1850–58, and at Toronto published the weekly *Mackenzie's Messenger* from 1858 until shortly before his death. The reforms for which he so persistently contended were in the main achieved in his lifetime. He wrote 'Sketches of Canada and the United States' (1833). Consult the 'Life' by Lindsey (1862); Lindsey's "Life" in 'The Makers of Canada' (1910); Dent, 'Story of the Upper Canada Rebellion' (1885); Read, 'The Canadian Rebellion of 1837)' (1896).

MACKENZIE, Canada, a district in the Northwest Territories, bounded north by the Arctic Ocean, east by Keewatin, south by Athabasca, and separated on the west from Yukon by the northernmost spur of the Rocky Mountains. The district created in 1895 and administered by the government of the Northwest Territories, is the largest in Canada, having an estimated area of 527,490 square miles, of which 34,265 squares miles are water. The surface generally is diversified; in the northwest it is a sterile waste; along the river valleys and on the western mountain slopes it is well forested with fir, pine, spruce and other northern trees, while coal and other minerals, although unexploited, are found. The principal lakes are Great Slave, Great Bear, Pelly and Clinton Colden. The chief rivers are the Mackenzie, the Coppermine and the Great Fish or Back River. The soil is comparatively unproductive, the climate being arctic and inhospitable except for the few summer months. The population, about 5,400, inhabit the trading settlements of the Hudson's Bay Company's along the Mackenzie and its tributaries. The pelts of the fur-bearing animals of the region are practically the only developed item of commerce.

MACKENZIE RIVER, Canada, a large river in the Northwest Territories, which flows from the Great Slave Lake, and after a northwesterly course of about 1,000 miles enters the Arctic Ocean by numerous mouths at the island-studded Mackenzie Bay. Its ultimate source is in Thutage Lake, the headwaters of the Finlay in northern British Columbia; its total length from Thutage Lake to the sea is 2,525 miles. Its tributary head-streams are the Great Peace River, which rises in British Columbia beyond the Rocky Mountains, and the Athabasca or Elk River, which has its source in the Rockies; these two rivers flowing into Lake Athabasca are discharged by the Great Slave River into Great Slave Lake whence issues the Mackenzie. The principal affluent of the Mackenzie is the Laird or Mountain River. With the exception of a slight obstruction in the rapids near Fort Good Hope, in lat. 66° N., the Mackenzie and its tributaries are navigable for a distance of over 1,800 miles, and from June to October steamboats of the Hudson's Bay Company ply from Great Slave Lake almost to the Arctic Ocean. Forts Providence, Norman and Good Hope are trading stations along its banks, while Forts McPherson, Franklin, Enterprise, Reliance, Resolution, Chippewyan, Nelson and Graham are along its tributaries. The valley is well-wooded with spruce, pine, poplar and birch, while coal, salt and other minerals abound in the region. The river is named after Alexander Mackenzie (q.v.), who first explored it in 1789.

MACKEREL, măk'ĕ-rĕl. The common mackerel (*Scomber scombrus*) is the best-known and most important member of the family *Scombridæ* and one of the most valuable of food-fishes, ranking in this respect behind the cod and herrings only. The mackerel is a compactly built fish of smooth and regular outline, the fusiform figure tapering accurately to the pointed snout, so that it cleaves the water easily. The large, deeply-forked tail is supported on a slender peduncle, provided with two small keels on each side, and preceded by a dorsal and a ventral series of finlets of five each. A soft dorsal and a counterpart anal fin are placed exactly opposite each other and behind the level of the vent, and the anterior dorsal fin is supported by usually 11 delicate spines. Very numerous and small scales cover the body nearly uniformly, but are absent from the head. The large mouth is provided with numerous small sharp teeth. The gill-rakers are long and the air-bladder is wanting. The color of the back is deep blue, marked by about 35 nearly vertical wavy black lines; below, the fish is silvery white. A recent close study of the species on the European side of the Atlantic establishes the existence there of local races, as in the herring, but it appears that the American representatives, while constituting a race distinct from the European, are more homogeneous.

The mackerel is an abundant fish on both sides of the north Atlantic, on the American side ranging from Cape Hatteras to the Straits of Belle Isle, and on the European from northern Norway to the Canary Islands and throughout the Mediterranean. While a true pelagic fish of wandering and migratory habits and, like most such, capricious in its movements, the great body of mackerel approaches the American coast and moves along it northward as the temperature of the water rises to about 45° F. On the approach of winter they retire to a greater distance from the land, but a few remain throughout the year near the coast. Mackerel swim in great schools at or near the surface; one such covering an area of 10 square miles, and another estimated as containing 1,000,000 barrels, have been observed. The local movements of the schools are largely regulated by the food-supply, which consists of small pelagic fishes, various kinds of small crustaceans, etc., which are pursued with great eagerness. On the other hand, the bluefish and other carnivorous fishes, porpoises, squids and fish-eating birds, are relentless enemies. Spawning takes place in the open sea, not far from the coast from Vineyard Sound to the Gulf of Saint Lawrence, and during the months of May, June and early July. The eggs are about one millimeter in diameter, contain an oil-drop and float at the surface, where the young fish develop and live. They grow rapidly and are about five inches long by the end of the first half year, when they are known as "spikes"; "blinkers" are about one year old and six or seven inches long; "tinkers" are seven to nine inches long and are supposed to be two years old. At the age of three or four

years the mackerel is mature and from 12 to 18 inches long. The very largest specimens weigh about four pounds and have a length of 22 to 23 inches.

The mackerel fishery is of the greatest importance in the New England States and Nova Scotia, and in Norway, Ireland and Great Britain. In Europe the fishery is prosecuted almost exclusively by means of small boats and hand lines, but in America is chiefly carried on in staunch sea-going schooners, most of which hail from Gloucester, Mass., and which are equipped with purse seines, by means of which entire schools are surrounded and captured. The fishing begins off Cape Hatteras in March or April and the schools are followed northward as they appear successively on the New Jersey, New England and Canadian coasts. In addition to the operations of this mackerel fleet, local fisheries are carried on along much of the coast, with pound-nets, gill-nets and hand-lines. The spring and local catches are generally sold fresh, the summer catch being split and salted. The product of the fishery has been peculiarly subject to fluctuations, due in large part to alternating periods of abundance and scarcity of the fish. Colonial writers refer to its great plenty, and statistics of the catch inspected in Massachusetts show a somewhat regular recurrence of such periods at intervals of about 20 years. From 350,000 barrels in 1880 and 395,000 in 1881, the catch steadily declined to 75,000 in 1886, and 18,000 in 1891, since which time it has greatly fluctuated.

The total weight of the mackerel landed in Boston and Gloucester in 1929 was 35,744,000 pounds a great increase over the catch of 1928 which was 23,517,000 pounds. Of the 1929 total, 21,264,000 pounds were landed at Boston, and 14,480,000 pounds at Gloucester. In addition there were landed at Portland, Me., in the same year 2,000,000 pounds. The total value of the mackerel landed at all three ports in 1929 was $1,382,400, compared with a value of $1,353,900 for the catch of 1928. The output of mackerel fry in 1929 was 2,778,000. The mackerel production of the Canadian provinces in 1928 was 123,768 hundredweight as compared with 158,797 hundredweight in 1927; and 251,478 hundredweight in 1922. The catch of 1928 was valued at $528,267; that of 1922 at $1,500,357.

An elaborate account of the American mackerel fishery will be found in Brown-Goode's 'Materials for a History of the Mackerel Fishery' (Report of the United States Fish Commission, 1884); for some recent views see Moore, 'Report National Fishery Congress' (Washington 1898); and for methods of preservation, Stevenson, 'The Preservation of Fishery Products for Food' (Bulletin of United States Fish Commission, 1898).

MACKEREL SHARK, or **PORBEAGLE,** a shark of the family *Lamnidæ,* allied to the man-eater (q.v.), and like it sometimes called blue shark, on account of its color, which is frequently seen on both sides of the northern Atlantic Ocean; it is the *Lamna cornubica* of ichthyologists. The ordinary length is about 10 feet, and they become very abundant in summer, when the mackerel are running, along the New England coast, and also about Great Britain, where they are called porbeagles. They are a nuisance to fishermen by destroying their nets, through which several will often tear their way (for they roam about in bands) in pursuit of captured fish. Formerly considerable quantities of oil were saved from their livers, but at present the value of this commodity does not pay for the trouble of taking them.

MACKEY, Albert Gallatin, American writer on Freemasonry: b. Charleston, S. C., 12 March 1807; d. Fortress Monroe, Va., 20 June 1881. He was graduated from the Medical College of South Carolina in 1832 and was demonstrator of anatomy there in 1838, but after 1844 devoted himself to studies of Freemasonry and became a standard authority on the subject. Among his works are 'A Lexicon of Freemasonry' (1845); 'The Mystic Tie' (1849); 'Book of the Chapter' (1858); 'A Manual of the Lodge' (1862); 'A Textbook of Masonic Jurisprudence' (1869); 'Encyclopædia of Freemasonry' (1874).

McKIBBEN, Chambers, American soldier: b. Pittsburgh, Pa., 2 Nov. 1841; d. May 1919. He enlisted as a private in the volunteer service 22 Sept. 1862, was brevetted captain for gallant services in the battle of North Anna River (Va.) and in the operations on the Weldon Railway, and on 1 May 1896 attained the rank of lieutenant-colonel of the 21st United States Infantry. At the beginning of the war with Spain he went to Cuba with Shafter's army, fought at Santiago (1 July 1898), and was made brigadier-general of volunteers and appointed military governor of Santiago. On 12 May 1899 he was mustered out of the volunteer service. Retiring in the same year, he was put in command of the Department of Texas, and two years later was transferred to the command of an infantry regiment. In 1902 he retired with the rank of brigadier-general.

McKIM, Charles Follen, American architect: b. Chester County, Pa., 24 Aug. 1847; d. 14 Sept. 1909. He was son of James Miller McKim, a Presbyterian minister who was an abolitionist. He studied at the Lawrence Scientific School in 1866, at the Beaux-Arts of Paris in 1867–70, and shortly afterward entered into partnership with Stanford White and William R. Meade. This firm achieved some of the finest triumphs of recent American architecture. Among notable examples of its work are the buildings of Columbia University, and the Public Library of Boston. In 1903 McKim received the royal gold medal from the Royal Institute of British Architects in recognition of his services to architecture. He was the second American to obtain this honor, R. M. Hunt (q.v.) having been the first. On the occasion of the presentation he made an able speech reviewing the progress of his profession in the United States. He was elected president of the American Institute of Architects.

McKIM, James Miller, American abolitionist: b. near Carlisle, Pa., 14 Nov. 1810; d. Llewellyn Park, West Orange, N. J., 13 June 1874. He was graduated from Dickinson College (Carlisle, Pa.) in 1828, studied medicine at the University of Pennsylvania and theology at Princeton (1831) and Andover (1832), and in 1835 was ordained a Presbyterian pastor in Womelsdorf, Pa. An original member of the American Anti-Slavery Society, he became its

lecturing agent in October 1836, and spoke throughout Pennsylvania, often at great personal danger. In 1840 he removed to Philadelphia, where he was publishing agent of the Pennsylvania Anti-Slavery Society and later corresponding secretary until 1862. In November 1862 he called a public meeting in Philadelphia to provide for 10,000 slaves suddenly liberated by the capture of Port Royal, S. C. As a result, the Philadelphia Port Royal Relief Committee was formed. This committee was expanded in November 1863 into the Pennsylvania Freedman's Relief Association, of which McKim became the corresponding secretary, in which capacity he was active in the establishment of Negro schools in the South. In 1865 he assisted in founding and became a proprietor of the New York weekly *Nation*. During the Civil War he was an advocate of the enlistment of Negro troops, and as a member of the Union League of Philadelphia assisted in the recruiting of 11 colored regiments.

MACKINAC ISLAND, măk'ĭ-nô, island, Michigan, in Mackinac County, at an altitude of 596 feet, at the entrance to the Straits of Mackinac in Lake Huron. It lies 255 miles northwest of Detroit. The island is 3 miles long and 2 miles wide. It is coextensive with Mackinac Island city and has been a state park since 1895. It came into prominence when the early missionaries and explorers realized its strategic value. It has steamboat connections with lake ports. It has a Daughters of the American Revolution library, a historical museum and an emergency hospital. Among local points of interest are the John Jacob Astor house, old forts, and a "most historical spot of Michigan" monument. The name is a shortened form of the Indian *Michilimackinak* meaning "great turtle." Pop. (1950) 572.

MACKINDER, mă-kĭn'dĕr, RIGHT HONORABLE SIR **Halford John,** English author and educator: b. Gainsborough, England, Feb. 15, 1861; d. England, March 6, 1947. He was educated at Christ Church, Oxford; in 1883 was president of the Oxford Union; barrister, Inner Temple, 1886; 1903–1908 director of the London School of Economics and Political Science. He was leader of the Mount Kenya expedition, 1899; member (Unionist) for the Camlachie division of Glasgow, 1910–1922. He was made privy councillor, 1926; vice president of the Royal Geographic Society, 1933–1936; Gold Medallist, American Geographical Society, 1943. He was author of *The Rhine* (1908); *Elementary Studies in Geography* (18th edition, 1930); *Democratic Ideals and Reality* (1919). See also GEOPOLITICS.

McKINLEY, mă-kĭn'lĭ, **William,** American statesman, 24th president of the United States: b. Niles, Trumbull County, Ohio, Jan. 29, 1843; d. Buffalo, N. Y., Sept. 14, 1901. He was educated at Union Seminary, Poland, Ohio, and Allegheny College, Meadville, Pa., 1860–1861. Forced by illness to discontinue his college course, he taught in the public schools, was a clerk in the Poland post office, and on June 11 enlisted for the Civil War as a private in Company E of the 23d Ohio Volunteer Infantry. His first battle was that of Carnifex Ferry, Sept. 10, 1861, and on April 15, 1862, while in camp at Fayetteville, western Virginia, he was promoted commissary sergeant. For conspicuous service at Antietam, Sept. 17, 1862, he was made second lieutenant of Company D. His subsequent appointments were, first lieutenant, Company E (Feb. 7, 1863); captain, Company G (July 25, 1864); and brevet major (March 14, 1865). When mustered out on July 26, 1865, he was acting assistant adjutant general on the staff of Gen. S. C. Carroll, commanding the veteran reserve corps stationed at Washington. Among other actions in which he participated were those of South Mountain, Sept. 14, 1862, Lexington, June 10, 1864, Kernstown, July 24, 1864, Opequan Creek (Winchester, Sept. 19, 1864), Fisher's Hill (Sept. 22, 1864), and Cedar Creek (Oct. 19, 1864). During his subsequent political career he was generally known, especially in Ohio, as Major McKinley. At the close of the war he began the study of law at Youngstown, Ohio (1865–1866), continued it at the Albany (N. Y.) Law School (1866–1867), in March 1867 was admitted to the bar at Warren, Trumbull County, Ohio, and at once entered practice at Canton. In 1870–1871 he was prosecuting attorney of Stark County, and during the campaign between R. B. Hayes and William Allen for the governorship of the state, spoke effectively against the "greenback" craze. He was elected to Congress as Republican representative from the 17th Ohio district in 1877, and served continually in the 45th, 46th and 47th Congresses (1877–1883). It was asserted by the Republicans that he was elected in 1882 to the 48th Congress by a majority of eight ballots; but, although he had received the certificate of election, his seat was successfully contested by J. H. Wallace, who was not, however, seated until June 1884. He represented the 20th district in the 49th Congress (1885–1887), and the 18th in the 50th and 51st Congresses; but in 1890 was defeated in the 16th for the 52d Congress by 300 ballots by J. G. Warwick, Democrat, lieutenant governor of the state a short time previously. His defeat was attributed to the gerrymandering of the district by a Democratic legislature. His service in Congress was notable. In 1877 he was appointed a member of the Judiciary Committee, and in December 1880 of the Ways and Means Committee to succeed James A. Garfield; and in 1881 was chairman of the committee in charge of the Garfield memorial exercises in the House. In 1889–1890 he was chairman of the Ways and Means Committee. He was a candidate for speaker of the 51st Congress, but was defeated by T. B. Reed on the third ballot in the Republican caucus. He was known among the foremost orators of the House; and his speeches on arbitration as a solution of labor troubles (April 2, 1886) and in support of the civil service laws (April 24, 1890) were most favorably received. But his principal efforts were made in connection with the tariff, which, from his first appearance in the House, was the chief object of his study. On April 6, 1882, he spoke in advocacy of protection; on April 30, 1884, in opposition to the Morrison tariff bill, making what was esteemed the ablest argument against that measure; and on May 7, 1890, in support of the general tariff bill, now known by his name, which, as chairman of the Ways and Means Committee, he had introduced before the House on April 16. The bill was passed by the House on May 21, by the Senate on September 11, and on October 6 became a law. His bill obtained for him an international reputation, and

eventually the Presidency. In 1884 he was delegate at large from Ohio to the Republican National Convention at Chicago, where he supported James Blaine's candidacy, and where, as chairman of the committee on resolutions, he helped to determine the platform of his party, which he read before the convention. In the Republican National Convention at Chicago in 1888, he was again a delegate and chairman of the committee on resolutions. He supported the candidacy of John Sherman, although, when it was finally learned that Blaine would decline the nomination, he was himself the choice of many delegates and was strongly urged to permit the use of his name. At the Minneapolis convention of 1892 he was once more a delegate and was elected permanent chairman of the assembly. He supported the renomination of President Harrison, and though refusing the use of his own name, received the ballots of 182 delegates. He then left the chair and moved to make Harrison's nomination unanimous, which was accordingly done. In the ensuing campaign he took a very active part, traveling, it was estimated, more than 16,000 miles and speaking to more than 2,000,000 voters.

In 1892–1896 McKinley was governor of Ohio, having been elected in 1891 by 21,500 plurality, and in 1893 by the unusual plurality of 80,995. Labor riots occurred during his administration, necessitating the placing of 3,000 militia troops in active service, but the difficulties were successfully adjusted. He also personally directed the relief work for the starving miners of the Hocking Valley district.

McKinley was nominated for the presidency by the Republican National Convention which met at Saint Louis, June 16, 1896, and was elected by a plurality of 601,854 over W. J. Bryan, receiving a popular vote of 7,104,779, and in the electoral college a vote of 271 to 176 for Bryan. Throughout the campaign he remained in Canton, where he made over 300 speeches to more than 750,000 visitors. Under his administration decided increase in business prosperity followed the passage of the Dingley tariff measure. The most important event of his term was the Spanish-American War (q.v.), which he had believed might be prevented and had done all in his power to avert. When hostilities broke out on the part of certain inhabitants of the Philippine Islands, the President appointed a commission to study the situation and report on the most suitable mode of government for the new territory. On July 7, 1898 he approved the joint resolution of Congress for the annexation of the Hawaiian Islands, and in 1898 he also selected a delegation to represent the United States in The Hague Peace Conference which convened in May 1899. The original Philippine Commission having rendered a report (Jan. 31, 1900), the President appointed a new commission, known from its head, Judge W. H. Taft, as the Taft Commission, under whose direction civil government was instituted in the islands on Sept. 1, 1900. (See PHILIPPINES—*History.*)

In 1900 the President stood conspicuously for justice in the settlement of the difficulties in China which marked that summer. He was renominated for the Presidency by the Republican National Convention which met at Philadelphia on June 25, 1900, receiving the entire vote of the 930 delegates. He was elected by a popular vote of 7,206,677 to the 6,374,397 for W. J. Bryan, receiving the largest popular majority ever given a candidate for the Presidency up to that time. He obtained 292 electoral votes and carried 28 States. On Sept. 5, 1901 he delivered at the Pan-American Exposition, Buffalo, N. Y., an important address, summarizing at once the problems then before the nation and his policy for their solution.

On September 6, while holding a reception in the Music Hall of the Exposition, McKinley was twice shot by Leon Czolgosz, an anarchist. He died on September 14, and four days afterward a day of mourning and prayer was called throughout the country by his successor, President Theodore Roosevelt. Unprecedented honors were paid to McKinley's memory in foreign capitals, notably in London, where memorial services were held in Westminster Abbey and Saint Paul's Cathedral. A statue was erected in his honor at Columbus, Ohio, and unveiled in 1906. See also UNITED STATES—*History.*

Bibliography.—The official biography of McKinley is Olcott, Charles Sumner, *The Life of William McKinley* (Boston 1916). Other useful biographical sources are the campaign biography by Porter, Robert Percival, *Life of William McKinley, Soldier, Lawyer, Statesman* (Cleveland 1896) and Kohlsaat, Herman Henry, *From McKinley to Harding* (New York 1923).

McKINLEY, Mount (Russian BOLSHAYA, bŭl-y'-skà'yà), a peak of the Rocky Mountains, the highest in North America (20,300 feet above sea level) south of the central part of Alaska, about 155 miles north of Cook Inlet. The Indian name for this peak is Traleyka. The fact that this is the highest land on the continent was not known till 1896 when W. A. Dickey explored the Sushitna River and the land near its source, naming the peak in honor of president William McKinley. In 1903 it was visited by members of the United States Geological Survey and in 1917 the Mt. McKinley National Park was created.

Attempts to climb the peak began in 1903 but no expedition was successful until the Hudson Stuck expedition reached the top on June 7, 1913. It has been climbed several times since then and the mountain was used to test U.S. Army Air Force equipment in 1942.

McKINLEY ACT, a name popularly given to a tariff bill reported to Congress, May 21, 1890, by the Ways and Means Committee of the House of Representatives, of which William McKinley was chairman. It became a law in October 1890 and was repealed in 1894. It increased the duties on wool, woolen manufactures, on tin-plate, barley and some other agricultural products and remitted the duty on raw sugar. The reciprocity feature was an important part of the bill, providing for the remission of duty on certain products from those countries which should remove duties on American imported products. See TARIFF.

McKINNEY, Mrs. Glen Ford. See WEBSTER, JEAN.

McKINNEY, mà-kĭn'ĭ, city, Texas, seat of Collin County, 30 miles north of Dallas on the Southern Pacific Railroad and state and federal highways. Altitude 612 feet. In a rich agricultural area, McKinney has dairy and stock farms, poultry dressing and pecan shelling plants, and manufactures dairy products, textile products, clothing, feeds, beverages, confectionery, and mattresses. Among the public services of the com-

munity are a city library, a city-county hospital as well as a 1,000-bed veterans hospital, and a municipal pool and playground. About 10 miles to the south-southeast the Lavon Reservoir (capacity 423,300 acre-feet) on the East Fork of the Trinity River is surrounded by game preserves and a recreational area.

The city was named for, and has a monument to, Collin McKinney, a signer of the Texas declaration of independence. The Collin McKinney home was built in 1836 and is now located in the city park. McKinney was founded in 1842 and has a commission form of government. Pop. (1950) 10,560.

MACKINTOSH, Charles Rennie, Scottish architect and painter: b. Dennistoun, Glasgow, Jan. 7, 1868; d. London, Dec. 10, 1928. A student at the Glasgow School of Art and a member of the firm of Honeyman and Keppie, he traveled abroad on the Alexander Thomson scholarship in 1890, and in 1894 submitted the prize-winning designs for the new building of the Glasgow School of Art. This building, completed in 1909, was representative of the originality and freedom from tradition characteristic of all his work. In 1897 he undertook, in collaboration with George Walton, the decoration and furnishing of Miss Cranston's Tea-Rooms in Glasgow, which embodied the features of what was later termed in Germany the "Glasgow School style."

Gaining considerably more renown on the Continent than in his own country, Mackintosh had commissions and exhibitions in many European cities, and, although he had no followers in Great Britain, he founded the so-called *Jugendstil* in Germany. After World War I he devoted his time to water colors and became one of the first British masters of abstract design.

MACKINTOSH, măk'ĭn-tŏsh, Sir **James,** Scottish historian and philosophical writer: b. Aldourie, Inverness-shire, Oct. 24, 1765; d. London, May 30, 1832. He was educated at Aberdeen and Edinburgh; studied medicine and took the M.D. degree in 1787; published his *Vindiciae Gallicae* in answer to Burke's *Reflections on the French Revolution;* quitted the medical profession and was called to the English bar in 1795. By reason of his brilliant lectures on the *Laws of Nature and Nations,* and his defense of Jean Gabriel Peltier, who was prosecuted for a libel on Napoleon Bonaparte, he acquired fame at the bar, and in 1804 was appointed recorder of Bombay and received the honor of knighthood.

After an honorable career in India, Mackintosh returned to England, entered Parliament for Nairn and afterward for Knaresborough, was professor of law at Haileybury College (1818–1824), a member of Privy Council, and in 1830 commissioner of the Board of Control. Among his writings may be mentioned his *History of England,* a fragment extending only to the reign of Elizabeth; *Dissertation on the Progress of Ethical Philosophy* in the *Encyclopaedia Britannica;* a *Life of Sir Thomas More* in Lardner's *Cabinet Cyclopaedia,* and nine chapters of an unfinished work on the revolution of 1688.

MACKINTOSH, a water-proof overcoat, or outer garment, one of the products of modern rubber manufacture. It derives its name from the inventor, Charles Mackintosh of Manchester (1766–1843). See Rubber.

MACKLIN, măk'lĭn, **Charles,** Irish actor and dramatist: b. Ireland, May 1, 1697; d. London, July 11, 1797. He was the son of an Irish gentleman named McLaughlin and in 1733 appeared in minor parts at Drury Lane, London. He steadily rose in public favor, until in 1741 he appeared in his greatest role, Shylock. He was accounted from this period among the best actors of the time. His last performance was at Covent Garden in May 1789, at past the age of 90. In 1735 he accidentally killed a brother actor in a quarrel and was tried for murder, and was frequently afterward engaged in disputes and actions at law. Of his own plays only *The Trueborn Irishman; Love a-la-Mode* (1759), and *The Man of the World* (1781) have been printed.

MACKUBIN, mă-kŭb'ĭn, **Florence,** American artist: b. Florence, Italy, May 19, 1861; d. Baltimore, Md., Feb. 2, 1918. She was of American parentage, and studied under Louis Deschamps and Julius Rolshoven in Paris and Herterrich in Munich, also miniature painting under Mlle. J. Devina in Paris. She specialized in portrait and miniature painting, and was officially commissioned to execute various portraits for the Executive Mansion and State House, Maryland, among them a copy of Van Dyck's portrait of Queen Henrietta Maria, and portraits of Governors Calvert and Eden of Maryland. Other portraits are those of Sir Charles Drury at the Admiralty House, Chatham, England, and Sir William Van Horne, Canada. Her miniatures won a medal at the Tennessee Exposition.

McLACHLAN, măk-lăk'lăn, **Alexander,** Scottish Canadian poet: b. Johnstone, Renfrewshire, Scotland, Aug. 12, 1818; d. Orangeville, Ontario, March 30, 1896. He went to Canada in 1841, was Canadian immigration agent to Scotland in 1862, and in 1874 delivered in Scotland a series of lectures on Canadian life. He lectured also in Canada and the United States.

McLachlan was a man of broad and democratic sympathies and was deeply interested in the betterment of conditions among the working classes. Among his publications were *Poems, Chiefly in the Scottish Dialect* (1855); *Lyrics* (1858); *The Emigrant and Other Poems* (1861); *Poems and Songs* (1874).

McLANE, măk-lān', **Allan,** American soldier and jurist: b. Philadelphia, Aug. 8, 1746; d. Wilmington, Del., May 22, 1829. In 1774 he settled in Kent County, Del., and in the revolution he took a prominent part. He became a lieutenant in Thomas Rodney's regiment of Delaware militia, where he rendered important service at Long Island and White Plains and also in the New Jersey campaign. In 1777 he was made captain and was in command of the American guard about Philadelphia, taking active part in the battle of Monmouth. With the rank of major under Gen. Henry Lee he participated in the capture of Stony Point and Paulus Hook and attained colonel's rank.

At the close of the war McLane was appointed judge of the Delaware Court of Appeals. From 1790 to 1798 he was United States marshal of Delaware under Washington's appointment, and from 1808 until his death collector of Wilmington (Del.) port. He also served in the Delaware legislature, being for a time speaker of the lower house.

McLANE, Louis, American statesman: b. Smyrna, Kent County, Del., 28 May 1786; d. Baltimore, 7 Oct. 1857. He was the son of Allan McLane (q.v.), and entering the navy at an early age, served as a midshipman under the elder Decatur. Quitting the navy in 1801 he studied law, was admitted to the bar in 1808 and rose to eminence in the profession. He represented Delaware in Congress, 1816–27, when he was chosen United States senator. In 1829–31 he was Minister to Great Britain, and on his return home was made Secretary of the Treasury. In 1833 he declined to sanction the removal of the deposits from the United States Bank, and was consequently transferred by the President to the State Department. He held the office of Secretary of State till June 1834, when he resigned and retired from political life. In 1837 he accepted the presidency of the Baltimore and Ohio Railroad, which he held till 1847. In June 1845 he was appointed by President Polk ambassador to London during the Oregon negotiations, after the settlement of which he resigned. In 1850 he was a member of the convention to reform the constitution of Maryland.

McLANE, Robert Milligan, American politician and diplomat: b. Wilmington, Del., 23 June 1815; d. Paris, France, 16 April 1898. He studied at the Collège Bourbon of Paris (1829–31), was graduated from West Point in 1837, took active part in the Seminole War in Florida (1837), and served under General Scott in the Cherokee country (Georgia). He resigned from the army in 1843, and having already been admitted to the bar in the District of Columbia, began practice at Baltimore, Md. In 1847–51 he was a Democratic member of the House of Representatives in the 30th and 31st Congresses. In 1853 he was appointed commissioner, with powers of minister plenipotentiary, to China, Japan, Siam, Korea and Cochin China; and from this mission he returned in 1856, having with Commodore Perry concluded important treaties. In 1859–61 he was Minister to Mexico, in which capacity he signed the treaty of 1860. In 1861 he returned to Baltimore and there took a prominent part in the discussions attending the secession of the Cotton States. He was one of the committee appointed by the Maryland legislature (May 1861) to confer with Lincoln in regard to alleged unconstitutional proceedings on the part of the Federal government within the State of Maryland. Upon the decision of the State legislature, based on the committee's report, that it was inexpedient for Maryland to secede, McLane retired from public affairs for a time. In 1877–78 he was State senator; in 1879–83 a representative in the 46th and 47th Congresses; and in 1883–85 governor of Maryland. He was Minister to France in 1885–89 by appointment of President Cleveland. After tendering his resignation in 1889, he spent his remaining years at Paris.

MACLAREN, mą-klär'ĕn, **Ian.** See WATSON, JOHN.

McLAREN, William Edward, American bishop: b. Geneva, Ontario County, N. Y., 15 Dec. 1831; d. New York, 19 Feb. 1905. He was graduated at Jefferson College, 1851, ordained to the Presbyterian ministry, 1860, and entered that of the Protestant Episcopal Church in 1872. Three years later he was appointed bishop of Illinois; after the subsequent division of the diocese became bishop of Chicago. He founded the Western Theological Seminary at Chicago (1883) and the Waterman Hall for Girls at Sycamore, Ill. Among his writings may be mentioned 'Catholic Dogma the Antidote of Doubt' (1884); 'Analysis of Pantheism' (1885); 'The Holy Priest' (1889); 'The Essence of Prayer' (1901).

McLAUGHLIN, măk-lâk'lĭn, **Andrew Cunningham,** American historical writer: b. Beardstown, Ill., 14 Feb. 1861. He was graduated from the University of Michigan in 1882, from its law school in 1885, was professor of history there 1891–1906 and since 1906 at the University of Chicago. He was director of the bureau of historical research of Carnegie Institution, Washington, D. C., 1903–05, and managing editor of the *American Historical Review*, 1901–05. He has written 'Lewis Cass' (in 'American Statesman' series 1891); 'History of Higher Education in Michigan'; 'History of the American Nation' (1899); 'The Confederation and the Constitution' (1905); (with Van Tyne) 'History of United States for Schools' (1911); 'The Courts, The Constitution and Parties' (1912); 'Steps in the Development of American Democracy'; and edited 'The Cyclopædia of American Government' (1914).

McLAUGHLIN, Mary Louise, American artist: b. Cincinnati. She began to decorate pottery in 1877 and made Losanti porcelain (1898), exhibiting for the first time in the Paris Exposition of 1900. She has been awarded several public honors for her work. Among her published writings are 'China Painting'; 'Pottery Decoration'; 'Painting in Oil'; 'The Second Madame'; 'An Epitome of History' (1923).

MACLAURIN, măk-lâ'rĭn, **Colin,** Scottish mathematician and philosopher: b. Kilmodan, Argyleshire, February 1698; d. 14 June 1746. He was educated at Glasgow University, and in 1717 became professor of mathematics in Marischal College, Aberdeen, and two years after was chosen Fellow of the Royal Society. In 1720 he published 'Geometrica Organica,' a work on curves. In 1725 he was elected professor of mathematics at Edinburgh, where his lectures contributed much to raise the character of that university as a school of science. A controversy with Bishop Berkeley led to the publication of Maclaurin's great 'Treatise on Fluxions' (1742). He also wrote a 'Treatise on Algebra'; 'Account of Sir Isaac Newton's Philosophical Discoveries,' etc.

MACLAURIN, Richard Cockburn, American educator: b. Lindean, Scotland, 5 June 1870; d. Boston, Mass., 15 Jan. 1920. He took his M.A. at the University of Cambridge in 1897, was elected a Fellow at Saint John's College, Cambridge, in 1897 and was professor of mathematics there in 1898–1905. He was dean of the faculty of law at the New Zealand University in 1905–07; and in 1907–09 he was professor of mathematics at Columbia University, New York. After 1909 he was president of the Massachusetts Institute of Technology. He wrote 'Title to Realty'; 'Theory of Light'; 'Lectures on Light.'

McLAWS, măk-lâz', **Lafayette,** American military officer: b. Augusta, Ga., 15 Jan. 1821; d. Savannah, Ga., 24 July 1897. He was grad-

uated at West Point in 1842; served in the Mexican War till the surrender of Vera Cruz; and at the beginning of the Civil War was commissioned a brigadier-general in the Confederate army. He was promoted major-general 23 May 1862, and during the march of Sherman to the sea commanded the defenses of Savannah and had charge of the military district of Georgia. He was appointed collector of internal revenue at Savannah in 1875 and postmaster there in 1876.

MACLAY, mą-klā', **Edgar Stanton,** American author: b. Foochow, China, 18 April 1863. He was graduated at Syracuse University in 1885; was reporter on the Brooklyn *Times,* 1886–90, and on the New York *Tribune* 1891–93; served on the editorial staff of the *Tribune,* 1893–95, and on that of the New York *Sun,* 1895–96. In 1896 he was appointed lighthouse-keeper at Old Field Point, and in 1901 received an appointment at the New York navy yard. He edited the 'Journal' of William Maclay (q.v.), and was the author of a 'History of the United States Navy,' which occasioned much controversy and brought about his dismissal from government employ, by order of President Roosevelt, in 1901. The ground of this action, following Maclay's refusal of an official request for his resignation, was a passage in the 'History' stigmatizing Read-Admiral Schley as a "caitiff, poltroon and coward" for his conduct in the naval fight off Santiago, Cuba, 3 July 1898. Maclay also wrote 'Reminiscences of the Old Navy' and 'The History of American Privateers.' He died 2 Jan. 1919.

MACLAY, Robert Samuel, American Methodist Episcopal clergyman: b. Concord, Franklin County, Pa., 7 Feb. 1824; d. 1907. He was graduated at Dickinson College in 1845 and entered the Methodist ministry in 1846. He sailed as a missionary to Foochow, China, 13 Oct. 1847. He was a member of the committee which translated the New Testament into the Foochow dialect; and in 1852–72 he was superintendent and treasurer of the Foochow Mission. He was transferred to Japan in 1872, becoming secretary and treasurer of the mission there; and assisted in translating the New Testament into Japanese. He was a delegate from Japan to the Ecumenical Methodist Conference at London in 1881. He was one of the founders of the Anglo-Chinese College at Foochow in 1881; and in 1884 he secured from the king of Korea permission to establish Christian missions in that country. He was instrumental in founding at Tokio in 1883 the Anglo-Japanese College, of which he was president in 1883–87; and the Philander Smith Biblical Institute in 1884, serving as dean in 1884–87. He was dean of the Maclay College of Theology at San Fernando, Cal., from 1888 until his retirement in 1893. Author of 'Life Among the Chinese' (1861); coauthor with Rev. C. C. Baldwin 'Dictionary of the Chinese Language in the Dialect of Foochow' (1871).

MACLAY, William, American soldier and politician: b. New Garden, Chester County, Pa., 1737; d. 1804. He was educated in his native place; was a lieutenant in the French and Indian War, taking part in the expedition against Fort Duquesne in 1758 and afterward serving under General Bouquet. He studied law, was admitted to the bar, went to England on behalf of militia officers serving in the French and Indian War, to confer upon their claims for land-grants with the proprietors of Pennsylvania, and on his return became attorney to the Penn family. In the Revolution he raised troops and equipped them, was assistant commissary of purchase and performed some field service. In 1781 he was elected to the Pennsylvania assembly, afterward held other offices in the State, and with Robert Morris (q.v.) was elected to the United States Senate, Pennsylvania's first representatives in that body. His service there ended in 1791, but in the Senate he had shown deep-seated hostility to Washington and his administration, which was the chief distinction of Maclay's senatorial career. In his later years he was a member of the Pennsylvania legislature and his last public office was that of a county judge. Consult his 'Journal,' edited by Edgar Stanton Maclay (q.v.).

MACLE, măk'l, in mineralogy, a variety of andalusite, occurring in long, tapering crystals in clay-slate. They have the axes and angles of a different color from the rest of the crystals, owing to a regular arrangement of impurities in the interior.

MacLEAN, George Edwin, American educator: b. Rockville, Conn., 31 Aug. 1850; d. 3 May 1938. He was graduated at Williams College in 1871 and at Yale Theological Seminary in 1874; from 1877 to 1881 was pastor at Troy, N. Y.; studied in Germany; and in 1883 became professor of English language and literature at the University of Minnesota. He was chancellor of the University of Nebraska, 1895–99, and from 1899 to 1911 was president of the University of Iowa. In 1913 he was sent by the United States Bureau of Education to make a study of the English universities and colleges. His writings include 'A Chart of English Literature' (1892); 'Old and Middle English Reader' (1893); and 'A Decade of Development in American State Universities' (1898); 'Present Standards of Higher Education in the United States' (1913); 'Studies in Higher Education in England and Scotland, with Suggestions for Universities and Colleges in the United States' (1916); 'The New International Era' (1923). He edited 'Ælfric's Anglo-Saxon Version of Alcuini Interrogationes Sigewulfi Presbyteri in Genesin' (1883); 'An Introductory Course in Old English,' by Wilkin and Babcock (1888) and 'An Old and Middle English Reader,' by Zupitza (1889).

McLEAN, George Payne, American lawyer and politician: b. Simsbury, Conn., 7 Oct. 1857. He was for a time a reporter on the Hartford *Evening Post,* then studied law, and was admitted to the bar in 1881, and immediately commenced practice in Hartford. In 1883–84 he was a member of the general assembly, where he soon became distinguished for facility in debate and was considered one of the leaders of the Republican party. In 1888 he was elected State senator and in 1900 nominated by his party as governor of Connecticut and elected. Though he was not widely known at the time of his election, his independent position in regard to constitutional reform soon made him prominent; both in his first governor's message and before the constitutional convention, he advocated representation in the

legislature according to population instead of by towns. Though in this he opposed certain elements in his own party, he gained support from a considerable number of Democrats and great personal popularity in the cities. In 1902 he was offered renomination, but declined; in 1903–04 he was a prominent candidate for United States senator. He was elected to the United States Senate in January 1911 and took office on March 4 following. He was re-elected in 1917 and 1923. He was the author of the "Federal Migratory Bird Bill," which became a law on March 4, 1913. He died June 6, 1932.

MacLEAN, James Alexander, Canadian educator: b. Mayfair, Ontario, Aug. 2, 1868. He was graduated at the University of Toronto in 1892 and took his A.M. at Columbia in 1893. He was professor of political science at the University of Colorado in 1894–1900; president of the University of Idaho in 1900–13; and from 1913 to 1934 was president of the University of Manitoba, Canada. Author of essays in *The Financial History of Canada* (1894). He died in London, Eng. Jan. 18, 1945.

MacLEAN, John, American jurist and statesman: b. Morris County, N.J., March 11, 1785; d. April 4, 1861. He removed with his parents to Warren County, Ohio, in 1799, later went to Cincinnati, where he studied law, and was admitted to the bar in 1807, and commenced practice at Lebanon, Warren County, Ohio. He was a member of Congress 1812–16, and from 1816–22 judge of the supreme court of Ohio. In July 1823 he was appointed postmaster general, the Post Office Department being then in a very disordered and inefficient condition. Under his administration this branch of the public service was restored to order, and managed with a vigor, method and economy that soon secured an almost unexampled degree of applause and public confidence. In 1829 he became associate justice of the Supreme Court of the United States. In this capacity his charges to grand juries while on circuit are distinguished for ability and eloquence. In the Dred Scott case he dissented from the decision of the court as given by Chief Justice Taney, and expressed the opinion that slavery has its origin merely in power, and is against right and in this country is sustained only by local law.

McLEAN, John, American educator: b. Princeton, N.J., 1800; d. there, 1886. His whole life was spent in Princeton. He was graduated from the college there in 1816, became tutor in the institution in 1818 and was a member of the faculty till 1868, when he resigned the presidency, which he had held from 1854. He published *Lecture on a Common School System for New Jersey* (1829), which in later years had much influence in the establishment of such a system; *History of the College of New Jersey* (1877), and *The True Relations of the Church and the State to Schools and Colleges* (1853).

MACLEAN, John, Canadian Methodist clergyman and author: b. Kilmarnock, Scotland, Oct. 2, 1851. He was educated at Victoria University, Cobourg, Ontario, and at the Wesleyan University, Bloomington, Ill. He served as a missionary among the Blood Indians near Macleod, Alberta, in 1880–89, and was pastor at Moose Jaw, Saskatchewan, in 1889–92; later filling pastorates at Port Arthur; and at Neepawa and Carman, Manitoba. In 1902–06 he edited *The Wesleyan,* and thereafter was stationed at Morden, Manitoba. In 1888 he was appointed a member of the Northwestern Board of Education. Author of *The Indians of Canada* (1892); *The Destiny of the Human Race; The Hero of the Saskatchewan; Better Lives for Common People; Science and the Bible.* D. March 27, 1928.

McLEAN, Norman, British Orientalist: b. Lanark, Scotland, Oct. 2, 1865. He was educated at the University of Edinburgh and at Christ College, Cambridge. He was examiner in classics at Edinburgh University in 1891–94; examiner for Oriental Languages Tripos in 1895–96, 1899–1900, 1909–11, and for theological Tripos in 1896–97, 1901–02, 1908–09, 1911–12. He was Fellow, senior tutor, Hebrew lecturer and Master at Christ College, Cambridge, and university lecturer in Aramaic. He edited with Rev. A. E. Brooke, a larger Cambridge edition of the Septuagint. He was an editor of *Ecclesiastical History of Eusebius in Syria* (1896).

McLEAN, Sarah Pratt. See GREENE, SARAH PRATT McLEAN.

MacLEISH, Archibald, American poet, librarian, and public official: b. Glencoe, Ill. May 7, 1892. He received his preliminary education at The Hotchkiss School, Lakeville, Conn., and was graduated from Yale University in 1915. He served in the First World War as a captain of field artillery, and in 1919 was graduated from Harvard Law School. In 1923 he abandoned the law to devote his time to the writing of poetry, developing into one of America's foremost poets. His published works include *The Happy Marriage* (1924); *The Pot of Earth* (1925); *Nobodaddy* (a play, 1925); *Streets in the Moon* (1926); *The Hamlet of A. MacLeish* (1928); *New Found Land* (1930); *Conquistador,* which won the Pulitzer prize for poetry (1932); *Frescoes for Mr. Rockefeller's City* (1933); *Union Pacific—a Ballet* (1934); and *Panic* (a play, 1935). He also wrote two radio verse dramas, *The Fall of the City* and *Air Raid.* On June 7, 1939 he was nominated by President Roosevelt to succeed Dr. Herbert Putnam, retiring Librarian of Congress, and the Senate confirmed his nomination June 29. In December 1944 at the instance of Secretary of State Stettinius he was appointed assistant secretary of state in charge of public and cultural relations. He resigned the post August 1945.

McLEMORE'S COVE, Ga., Military Operations at. While there was little fighting in the cove, the operations there in September 1863 were vital to the success of General Rosecrans' campaign for Chattanooga. The failure of General Bragg's excellent combinations immediately increased the difficulty of interposing his army between the Union army and Chattanooga and, in the end, made it impossible.

Lookout Mountain bounds the cove on the west. Following its eastern base from Chattanooga southward, it is 24 miles to Stevens' Gap, over which the Fourteenth corps, General Thomas', which constituted the center of Rosecrans' army, crossed Lookout from the west into the cove. Eight miles beyond is Dougherty's Gap, from which point Pigeon Mountain, run-

ning northeastwardly, forms the eastern boundary of the cove. The triangular area thus enclosed is from five to eight miles wide, the mouth opening toward Chattanooga, and contains from 80 to 100 square miles. General Bragg, in evacuating Chattanooga, because of Rosecrans' flank movement, had conducted his army by way of Rossville and Lee and Gordon's Mill and established it behind Pigeon Mountain, from a point near Lee and Gordon's to Lafayette, 13 miles beyond. From this position of his army there were four gaps through which roads led into McLemore's Cove. Opposite Lafayette was Dug Gap, to the south of it Blue Bird and to the north Cattlett's and Wrothen's. Dug Gap was directly opposite Stevens' Gap. The Chickamauga Creek rises near Dougherty's Gap and runs northward through the cove.

The right of the Union army, A. McD. McCook's Twentieth corps, with the cavalry corps, Gen. D. S. Stanley, crossed Lookout at Valley Head, 42 miles south of Chattanooga, and descended south of Dougherty's Gap. The left of this army, Crittenden's Twenty-first corps, had crossed the north point of Lookout near Chattanooga and, leaving one brigade in that city, had advanced to the vicinity of Lee and Gordon's Mill. It there formed the left of the Union army. The centre corps was at Stevens' Gap, 15 miles distant, the right corps about 25 miles beyond that point, with the cavalry still farther south. This separation of Rosecrans' army was made necessary by the fact that there were no roads practicable for wheels crossing Lookout Mountain in closer proximity.

General Bragg was fully informed of the movements, and the isolation of the several Union corps. These movements, which placed each corps beyond supporting distance from either of the others, were immediately rendered still more precarious by reports received from General Sheridan on the extreme right that the enemy was retreating toward Rome, which led General Rosecrans to order pursuit. General Thomas urged active concentrations instead, but was overruled.

General Bragg, from his position behind Pigeon Mountain, commanding the four gaps opening directly upon the advance of the centre across the cove, was in most favorable position for first striking General Thomas with effect, and then turning upon either of the wings before they could attain supporting distance. Had Bragg's orders been promptly and vigorously executed the situation of the Union army would have been critical.

The night of the 9th, Negley's division, forming the Union advance from Stevens' Gap along the road leading through Dug Gap to Lafayette, encountered the enemy in the gap, and later in the night it was ascertained that a strong force was concentrating there.

General Bragg, in developing his plan, had advanced Hindman's division from the Lafayette side of the mountain, and ordered General Hill to send Cleburne to co-operate. Late at night Hill sent word that Cleburne was sick, the gaps blocked with felled trees and that the movement was, therefore, impracticable.

Early the next morning General Buckner from the extreme right was ordered to advance into the cove to support Hindman. This junction was not effected until the afternoon of the 10th. Meantime, Negley had withdrawn his division from Dug Gap and was manœuvering in defense. Hindman, instead of attacking as ordered, sent a staff-officer to Bragg at Lafayette to suggest a change of plan. This officer reached Bragg at midnight and was at once directed to return and notify Hindman to carry out the orders he had received. Cleburne was then in Dug Gap, and had promptly cleared away obstructions. Walker's reserve corps was ordered forward to join Cleburne in the attack, and all impatiently waited for Hindman's guns. Bragg had ordered seven divisions to co-operate in this movement against Thomas' three which composed the Union centre. Hindman did not attack until afternoon. At that time Baird's division had arrived from Stevens' Gap to support Negley, and by brilliant movements in retreat, with some sharp fighting by T. R. Stanley's and Starkweather's brigades, the two divisions with their trains were withdrawn in perfect order to Bailey's crossroads, a strong strategic position in front of Stevens' Gap, where Brannan's division, which had completed the crossing of Lookout, was within easy supporting distance. Thus Bragg's attempt to crush the Union centre failed. For this failure he held Hill and Hindman responsible.

Bragg then withdrew the forces operating against the Union centre to Lafayette, and at once dispatched Polk's and Walker's corps with orders to attack Crittenden's corps in the vicinity of Lee and Gordon's Mill. This corps at the time was known to Bragg to be divided, with one of its three divisions near Ringgold. Polk was urged to attack with the greatest promptness. He, however, was led to believe that a general attack on his column was about to be delivered. Instead of carrying out Bragg's orders, he therefore awaited attack and sent for the whole of Buckner's corps as reinforcements. This delay enabled Crittenden to unite his forces, cross the Chickamauga, and take a strong position on the bluffs overlooking that stream at Lee and Gordon's. Thus Bragg's attempt to crush the Union left failed, as his movement on the centre had miscarried. For this Polk was held responsible.

Meantime the Union right was withdrawing under orders to join the centre at Stevens' Gap. Rosecrans had early discovered that Bragg, instead of retreating, was concentrated for battle, and that Johnston from Mississippi and Longstreet from Virginia were about to join him. General Rosecrans in his report says: "It then became a matter of life and death to effect the concentration of the army." The flanks of the army were 40 miles apart by the nearest practicable roads, and the centre was obliged to remain near Stevens' Gap until the right corps arrived.

General Bragg's third plan, for which orders were promptly given, was to move his army down the valley of the Chickamauga, cross at the bridges and fords below Lee and Gordon's Mill, sweep up the valley, attack Crittenden, the left of Rosecrans' army drive it back on the centre, and thus, interposing between the Union army and Chattanooga, push it back into the mountains and regain that most important city. Rosecrans, however, by an undiscovered night march moved his centre and right from the cove to the left of Crittenden, and at sunrise of 19 September had interposed between Bragg and Chattanooga on the field of Chickamauga.

These movements of the opposing armies brought on the battle of Chickamauga (q.v.).
H. V. BOYNTON.

McLENNAN, John Cunningham, Canadian physicist: b. Ingersoll, Ontario, 14 April 1867. He was educated at the universities of Toronto and Cambridge. From 1899 he was connected with the faculty in physics at Toronto, and after 1907 he served as professor of physics and director of the physical laboratory there. He was president of section III of the Royal Canadian Society in 1910; was elected to the Royal Society, London, in 1915; and in 1916–17 he was president of the Royal Canadian Institute. He was Dominion lecturer on the metric system in 1906; and was author of papers on radioactivity, electrical conduction of gases and spectroscopy. D. 9 Oct. 1935.

McLENNAN, măk-lĕn'ạn, **John Ferguson,** Scottish sociologist: b. Inverness, 14 Oct. 1827; d. Hayes Common, Kent, 16 June 1881. He was educated at King's College, Aberdeen, and Trinity College, Cambridge, and after two years spent in journalism in London returned to Edinburgh, and was called to the bar in 1857. His first important publication was the article on 'Law' in the eighth edition of the 'Encyclopædia Britannica' (1857), and in 1865 he elaborated some of its speculations in 'Primitive Marriage: an Inquiry into the Origin of the Form of Capture in Marriage Ceremonies.' In 1876 his 'Primitive Marriage' was republished with 'Kinship in Ancient Greece' and other matter under the title of 'Studies in Ancient History.' An unfinished work by him, directed against Sir H. S. Maine's patriarchal theory, was completed and published in 1885 by his brother under the title of 'The Patriarchal Theory.' In 1896 a second series of 'Studies in Ancient History,' treating of the origin of exogamy, was edited by his widow and Arthur Platt. Though his views are still and probably will remain matter of controversy, the study of primitive society received a powerful impetus from his important investigations.

McLEOD, măk-loud', **Alexander,** American Presbyterian clergyman: b. Island of Mull, Scotland, 12 June 1774; d. New York, 17 Feb. 1833. He came to the United States in 1792 and was graduated at Union College in 1798. He was licensed to preach in 1799 and was ordained in charge of the First Reformed Presbyterian Church of New York and of a church in Wallkill, N. Y. He soon resigned from the Wallkill charge, but retained his New York pastorate the remainder of his life. He was for a time an editor of the *Christian Magazine*. Author of 'Negro Slavery Unjustifiable' (1802); 'Ecclesiastical Catechism' (1807); 'View of the Late War' (1815); 'The American Christian Expositor' (2 vols., 1832–33), etc.

McLEOD, Archibald Angus, American railway official: b. Compton County, Quebec, Canada, 1848; d. 1902. Early in life he came to the United States, where he became a rodman on the docks of the Northern Pacific Railway at Duluth, and in 1885 manager of the Elmira, Cortland and Northern line. He then was successively acting general manager (1886), vice-president and general manager (1887) and president (1890) of the Reading system. His consolidation of the Lehigh Valley and Jersey Central with the Reading, under Reading control, for the purpose of controlling the carrying trade of the coal fields, resulted in the Reading passing into the hands of three receivers, of whom McLeod was one.

MacLEOD, Donald, Scottish Presbyterian clergyman and author: b. Campsie, Stirlingshire, 18 March 1831; d. 17 Dec. 1911. He was a brother of Norman MacLeod (q.v.), whom he succeeded as editor of *Good Words*, 1872–1905. He was educated at the University of Glasgow. He held pastorates at Lauder (1858), Linlithgow (1862) and Glasgow (1869–1909), and, like his brother, was chaplain to Queen Victoria. He published 'Sunday Home Service' (1885); 'Christ and Modern Society' (1893), etc.

MACLEOD, Fiona, pseudonym of William Sharp (q.v.), Scottish poet and novelist: b. Paisley, 12 Sept. 1856; d. Sicily, 13 Dec. 1905. A part of his youth was spent in the Hebrides and in the islands of Iona and Arran. His stories and poems attracted great attention by reason of their freshness of treatment and originality of conception. Under his own name he published a number of works, including poems, stories, and biography, beginning with a life of Rossetti in 1882. In 1893 he began writing mystical prose and verse under the pen name of 'Fiona Macleod,' and cleverly concealed his identity, going the length of supplying a fictitious biography of the lady, to 'Who's Who,' and corresponding, through his sister, with her admirers. He also wrote concurrently, under his own name. Among works published as Fiona Macleod are 'Pharais' (1895), a romance; 'The Mountain Lovers' (1895); 'The Sin-Eater and Other Tales' (1895); 'The Washer of the Ford' (1896); 'Green Fire' (1896); 'From the Hills of Dream' (1896); 'The Laughter of Peterkin' (1897); 'Through the Ivory Gate' (1901); 'The Silence of Amor' (1902).

McLEOD, Hugh, American soldier: b. New York, 1 Aug. 1814; d. Dumfries, Va., 2 Jan. 1862. He was graduated at West Point in 1835 and served on frontier duty at Fort Jesup, La., until June 1836, when he resigned. He then joined the Texans in their struggle against Mexico, and afterward practised law at Galveston, Tex. As brigadier-general of the Texas militia he was appointed by President Mirabeau B. Lamar of Texas to the command of an expedition planned to secure an establishment of trade between Texas and Mexico in 1841, but was taken prisoner by the Mexicans and not released until the following year, when the United States government intervened in his behalf. He served in the Texas Congress in 1842–43, fought through the Mexican War and was a member of the State legislature after the annexation to the United States. He joined the Confederate army in 1861 and served on the Rio Grande and in the first Virginia campaign.

McLEOD, John, Canadian pioneer: b. Stornaway, Island of Lewis, Scotland, 1788; d. Montreal, 24 July 1849. He was engaged in the service of the Hudson Bay Company in 1811, mustering men for the company's service in the Hebrides and conducting them to Canada. In 1812–16 he built the trading posts of the company for 500 miles westward of the Red River

establishment. He was the first man known to have traversed the continent from Hudson Bay to the Pacific coast. He was in charge of Norway House, the most important fur-trading establishment in that part of the country, in 1826–30. He was afterward in charge of the Saint Maurice district, extending from Hudson Bay to the Saint Lawrence. He was a man of wide influence among both the whites and the Indians and accomplished an important work in opening the northwest for settlement.

MACLEOD, John James Rickard, Canadian medical scientist: b. Dunkeld, Scotland, 6 Sept. 1876; d. 18 March 1935. He was educated at Aberdeen, Leipzig, and Cambridge universities and received his Ph.D. from the University of Toronto. Regius professor of physiology at the University of Aberdeen at his death, he was Anderson traveling fellow, University of Aberdeen in 1898–99; demonstrated in physiology at London Hospital in 1899–1903; MacKinnon scholar of the Royal Society, 1900–03; professor of physiology at Western University, Cleveland, Ohio, from 1903 to 1918, and professor at the University of Toronto from 1918 to 1935. In 1923 he was associate dean of the faculty of medical sciences. He was fellow of the Royal Society of Canada. His published works include: 'Diabetes: Its Physiological Pathology'; 'Fundamentals of Physiology and Biochemistry in Modern Medicine'; 'Carbohydrate Metabolism and Insulin'; 'Insulin'; and various articles in scientific journals.

McLEOD, Malcolm, Canadian lawyer, son of John McLeod (q.v.); b. Green Lake, Saskatchewan, 21 Oct. 1821; d. Ottawa, September 1898. He was educated at Edinburgh, Scotland, later studied law in Montreal and in 1845 was admitted to the bar. He engaged in practice, was district judge for the counties of Pontiac and Ottawa in 1873–76 and in 1887 he became Queen's counsel. He was prominently connected with the projects of annexation of the Northwest territory to Canada and the building of a railroad to the Pacific. He was instrumental in securing the revocation of the Hudson Bay Company's charter, taking the matter to the British Colonial Secretary when the Canadian Parliament refused to act. Author of 'The Peace River' (1872); five pamphlets on 'The Pacific Railway' (1874–80).

MACLEOD, Canada, town and capital of Macleod District, Alberta, on Old Man's River, about 100 miles south of Calgary, and on the Canadian Pacific Railway. It is situated in a rich agricultural and coal-mining region, has natural gas, stone quarries, and deposits furnishing materials for the manufacture of cement and of bricks. It has a considerable trade in grain. The village is growing rapidly and is a post of the Royal North West Mounted Police. Pop. (1936) 1,365.

MACLISE, mą-klēs', **Daniel,** English painter: b. Cork, 1806; d. Cheyne Walk, Chelsea, 25 April 1870. He became a student at the Royal Academy in 1828, and began to exhibit in 1829, but it was not until 1833 that he established his reputation with his picture of 'Snap Apple Night.' Three years after he was elected an associate, and in 1840 he became a full member of the Royal Academy. Maclise was commissioned to paint for the new Houses of Parliament, and produced 'The Spirit of Chivalry'; 'The Spirit of Religion,' and the two great paintings of the 'Meeting of Wellington and Blücher after Waterloo,' and the 'Death of Nelson' (1858–64), for which patriotic paintings he refused all remuneration. Among his best-known pictures are 'Merry Christmas in the Baron's Hall'; 'The Ordeal of Touch'; 'The Marriage of Strongbow and Eva'; the 'Play Scene in Hamlet'; the 'Banquet Scene in Macbeth,' etc. His sketches, book illustrations, humorous drawings and outline portraits were very numerous. He declined the presidency of the Academy in 1866. His works show great fertility of invention, skill in composition and excellence in drawing, but his color is coarse, and his pictures are sometimes disagreeable unless seen from a distance. His mural paintings are now recognized to be the greatest historical paintings of their kind ever produced in England. Consult O'Driscoll, 'Memoir of Daniel Maclise' (1871).

McLOUGHLIN, măk-lŏk'lĭn, **John,** Canadian pioneer and fur trader: b. Rivière du Loup, Lower Canada, 19 Oct. 1784; d. Oregon City, 3 Sept. 1857. He was educated in Canada and at Edinburgh, Scotland, studied medicine and in early manhood returned to Canada, where he entered the Northwest Company and was placed in charge of Fort William, the chief depot of the company, situated at the mouth of the Kaministiquia River on Lake Superior. Upon the consolidation of the Northwestern and the Hudson Bay companies, in 1821, Dr. McLoughlin was appointed chief factor of the company in the Oregon country. Arriving overland at Astoria in 1824 he founded Fort Vancouver, which, situated advantageously near the confluence of the Columbia and Willamette rivers, became the headquarters of the company beyond the Rockies. When Dr. McLoughlin established the fort the Indians were so hostile that it was unsafe for parties of less than 60 men to travel the Columbia River, but under his management of the company's affairs it became safe for two men to traverse the distance between Oregon City and Fort Hall. In the entire period of his administration, from 1824 to 1846, there were no Indian wars in the Oregon country, although they broke out in 1847, the year after his resignation. He made Fort Vancouver a haven of refuge to emigrants arriving after the perilous journey overland, furnishing goods and provisions on credit and caring for their sick in direct opposition of the company's policy, which was to keep the land wild for the wild fur-bearing animals. During McLoughlin's administration the Oregon country was in the condition of joint occupancy by the United States and Great Britain. His courageous and humanitarian method of dealing with the situation, recognizing the equal rights of the American settlers with those of the British Fur-trading Association, undoubtedly went far toward preventing war between the British and American nations. However, the strictures upon his methods by Sir George Simpson, governor-in-chief of the Hudson Bay Company, culminated in an order to render no further aid to immigrants, and McLoughlin resigned rather than obey, although it cost him his income of $12,000 a year. His resignation took effect in 1846, and he then retired to Oregon City where he had

extensive and partially improved land claims. Litigation over his claims embittered his last years, but after his death the land was restored to his heirs. He became an American citizen in 1848. The McLoughlin Institute was dedicated to his memory at Oregon City in 1907, and he is generally known as the "Father of Oregon." Consult the 'Reports' of the Washington Historical Society, the Oregon Historical Society and the Oregon Pioneer Association; Dye, E. E., 'McLoughlin and Old Oregon' (1900; 8th ed., 1913); Holman, F. V., 'Dr. John McLoughlin, the Father of Oregon' (1907).

McLOUGHLIN, Maurice Evans, American tennis champion: b. Carson City, Nev., 1890. He won the championship of the Pacific Coast, played in the East in 1908–09 and in 1909 and 1911 he competed for the Davis cup in Australia, but unsuccessfully. He won the national championship at Newport in 1912; and in 1913 was leader of the American team that captured the Davis cup from England. He was victor at Longwood and won the New York State championship in 1914. His defeat of Brookes and Wilding in singles made him world champion. Author of 'Tennis as I Play It' (1915).

McLOUTH, măk-lowth', **Lawrence Amos,** American educator and author: b. Ontonagon, Mich., 19 Jan. 1863; d. 1927. He was educated at the universities of Leipzig, Heidelberg and Munich. He was instructor in German at the University of Michigan in 1892–95; and after 1895 was professor of Germanic language and literature at New York University. He edited German texts, was author of numerous articles on literature, philology and pedagogy, and of 'Verses' (1910).

MACLURE, măk-lūr', **William,** American geologist: b. Ayr, Scotland, 1763; d. San Angel, near the city of Mexico, 23 March 1840. In 1796 he visited the United States, and in 1803 was in Europe as one of the commissioners to settle the claims of American citizens against France for spoliations during the revolution in that country. On returning to America he engaged with zeal in the extraordinary private undertaking of a geological survey of the whole country. Depending on his own resources and observations at a time when geology was unknown as a science, and few could appreciate his motives, he visited almost every State and Territory, crossing and recrossing the Alleghanies no fewer than 50 times. His first communication to the public was a memoir entitled 'Observations on the Geology of the United States, explanatory of a Geological Map,' read before the American Philosophical Society, 20 Jan. 1809, and published in Vol. VI of their 'Transactions.' He still continued his explorations, and on 16 May 1817 presented another memoir to the society, published in their 'Transactions,' and also in a separate volume. The former publication was six years prior to that of the geological map of England prepared by William Smith, a production which gave him the title of father of English geology. To Maclure is equally due the title of father of American geology. His publications attracted much attention to the science. He now settled in Philadelphia and gave his books and collections to the Academy of Natural Sciences of which he was president from 1817 till his death. He lived in Spain, 1819–24, where he attempted to found an agricultural college, and returning in 1824 to the United States attempted to carry out a similar scheme in the New Harmony settlement in Indiana. Several distinguished naturalists from Philadelphia joined him in this enterprise, but the scheme failed. After 1828 he lived in Mexico, always, however, with the intention of returning to the United States, and with his interest in the progress of scientific education there unabated. While in Mexico he wrote 'Opinions on Various Subjects,' devoted mainly to political economy (1837).

McMAHON, măk-mä'hŏn, **Sir Arthur Henry,** British soldier and administrator: b. 28 Nov. 1862. He was educated at the Royal Military College at Sandhurst, joined the 8th Regiment in 1883 and in 1885 entered the Indian Staff Corps and joined the 1st Sikhs, Punjab Frontier. He became affiliated with the Indian Political Department in 1890 and served as political agent on various missions until 1901, when he became Revenue and Judicial Commissioner at Beluchistan. He was an arbitrator on the boundary between Persia and Afghanistan in Seistan and also served as British Commissioner to the Seistan Mission in 1903–05. He was Foreign Secretary to the Government of India in 1911–14. In 1914–16 he was High Commissioner of Egypt. He was knighted in 1906.

McMAHON, James, American mathematician: b. County Armagh, Ireland, 22 April 1856; d. 1 June 1922. He was graduated at the University of Dublin in 1881. He was examiner in mathematics 1883–84, instructor 1884–90, assistant professor 1890–96, and professor after 1904 at Cornell University. In 1891–97 he was associate editor of *Annals of Mathematics.* Professor McMahon was joint author of 'Higher Mathematics' (1896); the 'Cornell Mathematical Series,' and 'Plane Geometry' (1903).

MacMAHON, Marie Edme Patrick Maurice de, Duke of Magenta and Marshal of France: b. Sully, Saône et Loire, 13 June 1808; d. near Montargis, 17 Oct. 1893. He was descended from an Irish family that went into exile with James II, and was educated at the military college of Saint Cyr; served with distinction in Algeria; became brigadier-general in 1848; received command of a division during the Crimean War, and assisted in storming the Malakoff; was appointed to the Senate in 1856; took part in the campaign of 1859 against Austria, and won the battle of Magenta by his prompt handling of the left wing and was rewarded by a marshal's baton and a dukedom; and in 1864 became governor-general of Algeria. At the outbreak of war between France and Germany (1870) MacMahon was placed in command of the First army corps, which was defeated at Weissenburg and Wörth, and finally fell back upon Châlons. Here he rallied his forces, and proceeded northeastward to relieve Bazaine, who was besieged in Metz, but he was pursued by the Germans, shut up by them in the town of Sedan and wounded in the battle before the final surrender with 81,000 men. After the armistice with Germany he was employed by the Versailles government in putting down the commune, and in 1873 was elected President of the republic, a position which he occupied until 1879. Consult Daudet, 'Souvenirs de la présidence du Maréchal de MacMahon' (Paris 1880); 'Le maréchal de MacMahon' (ib. 1883);

LaFarge, 'Histoire complète de MacMahon, maréchal de France, duc de Magenta' (ib. 1898).

MacMANUS, măk-măn'ŭs, **Seumas,** Irish novelist and writer of short fiction and verse: b. Donegal, 1868. He was educated at a mountain school in Donegal and engaged in teaching. He soon became known for his prose and verse contributions to periodicals, dealing with the traditions and folklore of Ireland. He visited America in 1899 and afterward his contributions appeared in many leading American periodicals. He has since made frequent lecture tours in America. Author of 'Through the Turf Smoke' (1899); 'Donegal Fairy Tales' (1900); 'Ballads of a Country Boy' (1905); 'The Leadin' Road of Donegal' (1900); 'Irish Nights'; 'Yourself and the Neighbors' (1914); 'Ireland's Case' (1917), etc. Among his plays are 'The Woman of Seven Sorrows'; 'Orange and Green'; 'Rory Wins'; 'Nabby Harren's Matching'; 'Top o' the Mornin',' etc.

McMASTER, John Bach, American historian: b. Brooklyn, 29 June 1852. He was graduated from the College of the City of New York in 1872, studied civil engineering, and 1877 became instructor of civil engineering at Princeton. In 1883 he published the first volume of his 'History of the People of the United States,' and the same year was appointed professor of American history in the University of Pennsylvania. His 'History,' of which eight volumes were published in 1913, has become a standard work. It covers a period reaching from the close of the Revolution (1783) to the outbreak of the Civil War,— less than 100 years, but a crucial time for the shaping of the country. The account of the formative time, the day of the pioneer and the settler, engaged his particular attention and received his most careful treatment. He strove to give a picture of social rather than constitutional and political growth; and tells the story of national evolution with admirable lucidity and simplicity of style, and always with an appeal to fact precluding the danger of the subjective writing of history to fit a theory. His other works are 'Benjamin Franklin as a Man of Letters' (1887); 'With the Fathers, Studies in American History' (1896); 'Origin, Meaning and Application of the Monroe Doctrine' (1897); 'A School History of the United States' (1897); 'A Primary School History of the United States' (1901); 'Daniel Webster' (1902); 'Brief History of the United States' (1903); chapters 9, 11 and 12, Vol. VII, 'Cambridge Modern History' (1903); 'Struggle for the Social, Political and Industrial Rights of Man in America' (1903); 'The United States in the World War' (1919); 'A History of the People of the United States' (1927). D. 24 May 1932.

McMASTER, William, Canadian senator and philanthropist: b. Tyrone, Ireland, 24 Dec. 1811; d. Toronto, Canada, 22 Sept. 1887. When 22 years of age he emigrated to Canada, and after several years' experience in a large wholesale firm in Toronto commenced business on his own account. He was elected a member of the legislative council for the Midland division of Canada in 1862, and held this seat until he was called to the Senate by royal proclamation in 1867. He was prominently identified with many public institutions, notably as president of the Canadian Bank of Commerce, member of the senate of the University of Toronto, chairman of the Canadian board of the Great Western Railway and became widely known by his liberal donations to educational and religious institutions, especially those of the Baptist denomination, of which sect he was a member. McMaster University, Hamilton, is named in his honor.

McMASTER UNIVERSITY, Hamilton, Canada, established in 1887 through the generosity of Senator William McMaster (q.v.) and by a charter from the Legislative Assembly of Ontario, is ultimately controlled through the Baptist Convention of Ontario and Quebec, which elects the members of the board of governors, 16 in number, exclusive of the Chancellor. It occupies a site of over 90 acres, surrounded by extensive parklands at the western limits of Hamilton, but prior to 1930 was situated in Toronto, where its Arts faculty was opened in 1890. At present it has an endowment of $2,250,000, owns five main buildings, and has a staff of 42 in two faculties, a library of 50,000 volumes, and an annual attendance of over 600, plus more than 350 part-time evening and summer students. A «Christian school of learning,» the university has no sectarian tests for students, and requires only that instructors be members of an evangelical Christian church. The present university grew directly out of the Canadian Literary Institute, established in 1857 by Baptists of central Canada, in Woodstock, Ont., under the principalship of Rev. R. A. Fyfe, D.D. This coeducational school was set up by act of Parliament, and provided literary and theological courses. Arts studies were partially developed through temporary affiliation with the University of Toronto in 1875, and in 1881 the theological work was transferred to Toronto, where the Toronto Baptist College was established through gifts of Senator McMaster, whose later bequest of $900,000 made possible the endowment of the new university in 1887. The college in Woodstock, changed into a boys' and young men's preparatory school, remained open until 1926, and a similar school for girls and young women, Moulton College, founded by Mrs. Susan Moulton McMaster in 1888, still operates in Toronto under the supervision of the McMaster Board of Governors. Matters of academic policy, including nominations to the faculty, are in charge of a Senate, which includes the governors and representatives of the faculty and alumni, while the board of governors makes appointments to the staff and deals with finances and all questions affecting the corporation. The removal to Hamilton, and consequent enlargement of the McMaster constituency and resources, were made possible through generous gifts from graduates, members of Baptist churches, and interested citizens of Hamilton.

HOWARD P. WHIDDEN,
Chancellor.

MacMECHAN, Archibald McKellar, Canadian scholar and author: b. Berlin (now Kitchener), Ontario, 21 June 1862; d. Halifax, N. S., 7 Aug. 1933. He was educated at the University of Toronto and at Johns Hopkins, and in 1889 was appointed professor of English language and literature at Dalhousie University, Halifax, N. S. He retained this position until shortly before his death. He published: 'The Relation of Hans Sachs to the Decameron';

The Porter of Bagdad (1901); *The Life of a Little College* (1914); *The Winning of Responsible Government* (1915); *Sagas of the Sea* (1923); *Headwaters of Canadian Literature* (1924); *The Book of Ultima Thule* (1927); *There Go the Ships* (1928); *Red Snow on Grand Pré* (1931); *Late Harvest,* poems (1934).

McMECHEN, măk-měk'ĕn, city, West Virginia; in Marshall County; altitude 710 feet. It is situated on the Ohio River, six miles south of Wheeling, and is served by the Baltimore and Ohio Railroad. McMechen is a residential community, with local industries. Nearby, at Moundsville, is the Grave Creek Mound, one of the best known Indian mounds in the country. McMechen was settled in 1823, incorporated in 1895, and has a mayor and council. Pop. (1950) 3,518.

MACMILLAN, măk-mĭl'ăn, **Daniel,** Scottish bookseller and publisher, founder of Macmillan & Co.; b. Upper Corrie, Isle of Arran, Sept. 13, 1813; d. Cambridge, Eng., June 27, 1857. He took service with a Cambridge bookseller in 1833, and with Messrs. Seeley, Fleet Street, London in 1837. He set up in business for himself in London in 1843, but soon moved to Cambridge, where in 1844 he became a publisher, quickly establishing a prosperous business. He published Charles Kingsley's *Westward Ho!* in 1855, and Thomas Hughes' *Tom Brown's School Days* in 1857, but he was established chiefly by educational publications and the works of Isaac Todhunter and F. D. Maurice.

Alexander Macmillan (b. Irvine, Ayrshire, Oct. 3, 1818; d. London, Jan. 25, 1896) became associated with his brother in 1843, and after the latter's death, opened a branch in London, which in 1863 became the headquarters of the firm. He was joined in the enterprise by his son George Macmillan (1855–1936), and two sons of Daniel, Sir Frederick Orridge Macmillan (1851–1936; knighted in 1909) and Maurice Crawford Macmillan (1853–1936); and through the establishment of numerous branches overseas the firm became one of the leading publishers of the English-speaking world. *Macmillan's Magazine,* the first of the shilling monthlies, made its appearance in 1859 and continued publication until 1907.

In 1893 Macmillan & Co. became a limited-liability company under the chairmanship of Sir Frederick. The branch opened in New York in 1869 became a separate concern, The Macmillan Company, in 1896, although the directors of the parent company retained control through stock ownership until Jan. 22, 1951, when it became wholly independent.

Consult Hughes, T., *Memoir of Daniel Macmillan* (London 1882); Graves, C. L., *Life and Letters of Alexander Macmillan* (London 1910); *The House of Macmillan (1843–1943)* (London and New York, 1944).

McMILLAN, Sir **Daniel Hunter,** Canadian administrator: b. Whitby, Ontario, January 1846; d. Winnipeg, April 14, 1933. He was educated in Canada and in 1864 served with the Canadian Volunteers on the Niagara frontier. He afterward took part in the military operations during the Fenian Raid in 1866; the Red River expedition of 1870; and in the Northwestern rebellion of 1885 he was awarded a medal. He represented Centre Winnipeg in the Manitoba Legislative Assembly, 1880–1900, and became a member of the Manitoba government in 1889. In 1900–1911 he was lieutenant governor of Manitoba. He was knighted in 1902.

MacMILLAN, Donald Baxter, American Arctic explorer: b. Provincetown, Mass., Nov. 10, 1874. He was graduated from Bowdoin College in 1898, and took postgraduate courses in anthropology at Harvard. In 1908 he joined the Peary Arctic Expedition, which culminated in 1909 in the discovery of the North Pole. He was a member of the Cabot Labrador Expedition in 1910, and in 1911–1912 did ethnological work in that region.

MacMillan organized his first independent expedition in 1913. This had for one of its purposes the solution of the problem of Crocker Land, which Peary believed he had seen on one of his earlier expeditions. MacMillan remained in the Arctic regions until 1917, proving the nonexistence of Crocker Land, and exploring a large part of the hitherto unvisited Grant Land on Ellesmere Island. MacMillan was appointed professor of anthropology at Bowdoin College in 1918. In 1920 he explored in the Hudson Bay region. In the next year he organized and commanded an expedition to Baffin Land (now called Baffin Island); followed in 1923–1924 by researches on the glaciers of Kane Basin, and in 1925 by an expedition whose chief purpose was to reach the North Pole by airplane. Commander Richard E. Byrd was in charge of the aeronautical part of the expedition. MacMillan visited Labrador, Baffin Island and Greenland in 1926 and 1927–1928; in 1944 commanded an expedition which made aerial surveys of Greenland, Baffin Island, and Labrador; and led expeditions to Ellesmere and Baffin islands in 1948 and 1949.

McMILLAN, Edwin Mattison, American physicist: b. Redondo Beach, Calif., Sept. 18, 1907. He was educated at the California Institute of Technology (B.S., 1928; M.Sc., 1929) and received his Ph.D. at Princeton University in 1932. He became a national research fellow at the University of California, 1932–1934; staff member of the Radiation Laboratory there from 1934; research associate, 1934–1935; instructor in physics, 1935–1936; and was assistant professor from 1936 until 1941, when he was called by the government to work on radar and, later in the same year, on sonar for the navy. McMillan also assisted in the development of the atomic bombs of the Hiroshima and Nagasaki types.

In 1940 McMillan was codiscoverer, with Philip Hauge Abelson, of element 93, which was named neptunium, obtained by bombarding the uranium isotope 238 with neutrons. His work on element 94, plutonium, was interrupted by World War II, but his experiments were continued by Glenn Theodore Seaborg, with whom he shared the Nobel Prize for chemistry in 1951.

Returning to the University of California as a full professor in 1946, McMillan developed the particle accelerator known as the synchrotron, a major advance over the cyclotron.

MacMILLAN, Sir **Ernest Campbell,** Canadian musician and composer: b. Mimico, near Toronto, Aug. 18, 1893. He was educated at the universities of Toronto and Oxford, and studied in Edinburgh and Paris. He was in Germany at the outbreak of World War I and was interned

at the Ruhleben Prison Camp. While there, he wrote a setting of Algernon Charles Swinburne's *England,* which Oxford later accepted for the degree of Mus.D. Returning to Canada, he was principal of the Toronto Conservatory of Music, 1926–1942; dean of the faculty of music at the University of Toronto from 1927, and conductor of the Toronto Symphony Orchestra from 1931. He was knighted in 1935.

MACMILLEN, măk-mĭl'ĕn, **Francis,** American violinist: b. Marietta, Ohio, Oct. 14, 1885. He entered the Chicago College of Music at the age of seven, afterward studying under Karl Markees and Joseph Joachim in Berlin, 1895–1899; under César Thomson in Brussels, 1900–1902; and later under Karl Flesch and Leopold Auer in St. Petersburg. He received first prize and the Val Hal cash prize at the Brussels Royal Conservatory in 1901, and made his debut in that city, March 30, 1903, afterward touring England, Belgium, France, and Germany. He made his American debut at Carnegie Hall, Dec. 7, 1906, and toured the United States. He toured Europe, 1911–1914; and played and taught there, 1929–1935; then returned to the United States.

McMINNVILLE, măk-mĭn'vĭl, city, Oregon; seat of Yamhill County; altitude 155 feet. It is situated on the Yamhill River, 21 miles north-northwest of Salem, and is served by the Southern Pacific Railroad. McMinnville is the trade center of an area producing livestock, dairy products, wheat, fruit, and nuts. Lumber, condensed milk, brick and tile, and gloves are manufactured. Linfield College (Baptist; coeducational), founded in 1857, is located here. W. T. Newby, a miller from McMinnville, Tenn., settled here in 1844 and named the town. It was incorporated as a town in 1876; as a city in 1882. Pop. (1950) 6,635.

McMINNVILLE, town, Tennessee; seat of Warren County; altitude 900 feet. It is situated 53 miles northwest of Chattanooga, and is served by the Nashville, Chattanooga and St. Louis Railway. The region is agricultural, with timber areas, and marble and granite quarries. The town manufactures wood products, textiles, shoes, hosiery, and overalls. Settled about 1800, it was incorporated as a village in 1808; as a town in 1872. Government is by mayor and council. Pop. (1940) 4,649; (1950) 7,577.

MacMONNIES, măk-mŏn'ĭz, **Frederick William,** American sculptor: b. Brooklyn, N. Y., Sept. 28, 1863; d. New York, N. Y., March 22, 1937. He was assistant and pupil to Augustus Saint-Gaudens, 1880–1884, and studied under Alexandre Falguière in Paris, where in 1886 and 1887 he won the Prix d'Atelier, the highest award for foreigners Opening his own studio in Paris in 1887, he won a second medal in the Salon of 1891 with his statues of Nathan Hale (now in City Hall Park, New York) and James Stranahan (Prospect Park, Brooklyn). Succeeding works were *Faun with Heron* (1892); *Sir Henry Vane* (1893; Boston Public Library); the *Columbian Fountain* for the World's Columbian Exposition at Chicago, 1893, once his most famous work; *Bacchante with Infant Faun* (1894; placed in the Metropolitan Museum of Art, New York, after being rejected on grounds of prudery by the Boston Public Library; replica in the Luxembourg, Paris); *Victory* (1895) for the battle monument at West Point, N. Y.; and a statue of Shakespeare (1898) in the Library of Congress.

The major works of his later sculptural period are *Washington at Princeton* (1918) for the battle monument at Princeton, N. J.; *Civic Virtue* (1919; City Hall Park, New York), a work criticized as lacking the idealism the subject seemed to demand, and later removed; and his massive, granite Marne Monument (1926). The latter work, 130 feet tall, was executed by Edmondo Quattrocchi from MacMonnies' designs, and was placed on a hill near Meaux, France, as a gift of the American people. It symbolizes France, as a woman, holding a fallen soldier, facing the enemy defiantly.

McMURRICH, măk-mûr'ĭk, **James Playfair,** Canadian scientist: b. Toronto, Ontario, Oct. 16, 1859; d. there, Feb. 9, 1939. Graduated from the University of Toronto in 1879, he received his Ph.D. from Johns Hopkins in 1885. From 1884–1886 he instructed at that institution in mammalian anatomy. He held a professorship in biology at Ontario Agricultural College (1882–1884); at Haverford (1886–1889); at Cincinnati (1892–1894). From 1889–1892 he was assistant professor of morphology at Clark University; professor of anatomy in the University of Michigan (1894–1907); and from 1907 until his retirement in 1930 was professor of anatomy at the University of Toronto. He published *A Textbook of Invertebrate Morphology* (1894); *The Development of the Human Body* (1902); *Leonardo da Vinci, the Anatomist (1452–1519)* (1930).

MacMURROUGH, măk-mûr'ô, **Dermot** (in Irish DIARMAID MACMURCHADA or MACMURCHADHA), king of Leinster: b. 1110?; d. Ferns, 1171. He succeeded his father, Enna, in 1126. After becoming infamous for his cruelty, in 1152 (according to *The Annals of the Four Masters*) he carried off Dervorgill, wife of Tiernan O'Ruark, lord of Breifne. Roderic O'Connor, recaptured Devorgill in 1153, and in 1166, after he had become high-king of Ireland, drove MacMurrough from the country. The latter applied for aid to Henry II of England, promising to hold his kingdom as Henry's vassal. Receiving permission to enlist adventurers among Henry's subjects, he was joined by Richard de Clare, to whom he promised his daughter, Eva, and succession to his kingdom. Returning to Ireland in 1167, MacMurrough maintained himself by guile until the arrival of de Clare in 1170, after which Wexford, Waterford, and Dublin were soon taken. Upon MacMurrough's death, de Clare, who had married Eva in 1170, claimed the kingdom. See also IRELAND—*History to 1601 A.D.*

McMURRY, Frank Morton, American educator: b. near Crawfordsville, Ind., July 2, 1862; d. Pawling, N. Y., Aug. 1, 1936. He studied at the universities of Michigan, Halle, Jena, Geneva, and Paris. He was professor of pedagogy at the Illinois State Normal School, 1891–1892; and at the University of Illinois, 1893–1894; dean of Teachers College, University of Buffalo, 1895–1898; and professor of elementary education at Teachers College, Columbia University, 1908–1926. He was the author of *Tarr and McMurry Common School Geographies,* with Ralph Stockman Tarr (1900; 1902); *Method of*

Recitation, with C. A. McMurry (1898); *How to Study and Teaching How to Study* (1909); McMurry and Benson, *Social Arithmetics* (1926). D. Aug. 1, 1936.

McMURTRY, Lewis S., American surgeon: b. Harrodsburg, Ky., Sept. 14, 1850; d. Feb. 1, 1924. He was educated at Centre College, Kentucky, and at Tulane University. He specialized in gynecology and abdominal surgery, becoming professor of those subjects in the medical department of the University of Louisville, where he afterward became president of the medical faculty. He was surgeon at the Louisville City Hospital, and was president of the American Medical Association in 1906–07. He contributed to the *International Text Book of Surgery*.

McNAB, Sir Allan Napier, Canadian statesman: b. Niagara, Ontario, Feb. 19, 1798; d. Aug. 8, 1862. He entered the navy as midshipman in 1813, but soon abandoned the navy for the army; was present at the capture of Fort Niagara, and commanded the advance guard at the battle of Plattsburg. At the close of the war he studied law and practiced in Hamilton, and in 1829 was elected a member of the assembly, and speaker 1837–41. During the insurrection of 1837–38 he commanded the militia on the Niagara frontier, routed the insurgents near Toronto Dec. 7, 1837; and a party of American sympathizers having occupied Navy Island in the Niagara River, whence they were cannonading the village of Chippewa on the Canadian side, he sent a party to seize the steamer *Caroline*, employed to convey them supplies, and having driven the crew ashore, set fire to it and sent it over the Falls. For his services to the crown during this insurrection McNab was knighted. In 1854 he was prime minister under the earl of Elgin, retaining office for a few months under his successor, Sir Edmund Head. On retiring in 1856 he was made a baronet.

McNAIR, măk-nâr', Frederick Vallette, American naval officer: b. Jenkintown, Pa., Jan. 13, 1839; d. 1900. He was educated at the United States Naval Academy and served in the *Minnesota* 1857–59. In 1861 he became lieutenant, and during the Civil War took part in the bombardment of Forts Jackson and Saint Philip, the capture of New Orleans and the destruction of the Confederate ram *Arkansas*. He was instructor at the naval academy 1867–68, in 1872 became commander and in 1887 was placed in command of the *Omaha* in the Asiatic squadron. In 1890 he became superintendent of the Naval Observatory. In 1895 he was made admiral, a member of the lighthouse board in 1898, and in July of the last-named year was appointed to take charge of Admiral Cervera and other Spanish prisoners of war. Upon their return to Spain he was appointed superintendent of the naval academy.

McNAIR, Leslie James, Lieutenant General of the United States Army; the Commanding General of the Army Ground Forces; according to General Marshall "the brains of the army"; killed in France in July 1944. Leslie McNair was born in Verndale, Minnesota, on May 25, 1883. He graduated from the United States Military Academy in 1904 and was commissioned a 2d lieutenant of artillery. On becoming a 1st lieutenant in 1905 he transferred to the Ordnance Department and was stationed at Sandy Hook Proving Ground, New Jersey, and later at Watertown (Mass.) Arsenal. In June 1908 he returned to field artillery and after four years went abroad to observe French artillery practice. From 1913 to 1916 he was at Fort Sill, Oklahoma, and then went to Mexico with General Pershing. In June 1917 he began a distinguished career in France on a staff with his friend George C. Marshall. He was promoted rapidly: lieutenant colonel 1917; colonel 1918; and at 35 years was the youngest brigadier general in the army. He earned the Distinguished Service Medal for skill in the use of artillery.

After the First World War he reverted to his permanent grade of major and during the next 15 years had various assignments: instructor, Fort Leavenworth; General Staff in Hawaii; professor of Military Science and Tactics at Purdue University; Artillery School, assistant commandant. He became a lieutenant colonel in 1928 and in 1935 as executive officer in the office of the Chief of Field Artillery was promoted to colonel. He was later commander of the 2d Field Artillery Brigade, Fort Sam Houston, and then commandant at the Command and General Staff School, Fort Leavenworth.

The big assignment came in July 1940 when as chief of staff, General Headquarters, he was charged with directing the gigantic training program. When the army was streamlined in 1942 he retained these duties becoming commanding general, Army Ground Forces, with rank of lieutenant general. His program included: factual training films; stiff obstacle courses; dangerous training under live ammunition maneuvers, realistic and tough. These he knew to be the only fit preparation for combat. Starting with about 1,000,000 men he finished with a trained army of nearly 8,000,000. In July 1944, satisfied that the job was done, he sought and received assignment to the field. Shortly afterward in France, while observing, he was killed by the unfortunate misdirection of one of his own army's bombs.

MACNAMARA, Thomas James, British statesman and author: b. Montreal, Canada, Aug. 23, 1861; d. Dec. 3, 1932. He went to England at an early age and was educated at Saint Thomas School, Exeter, and at the Borough Road Training College for Teachers. He was engaged in teaching in 1876–92 and was president of the National Union of Teachers in 1896. Elected to Parliament for North Camberwell in 1900, he served as parliamentary secretary of the Local Government Board in 1907–08 and to the Admiralty in 1908–15, in 1908–20 was financial secretary to the admiralty and minister of labor 1920–22. He was author of numerous textbooks.

McNAUGHTON, Andrew George Latta, Canadian soldier: b. 1887. Commander in chief of the Canadian Active Service Force from 1940. General McNaughton was educated at Lennoxville and at McGill University, the Royal Staff College, Camberley, and the Imperial Defense College, London. During the war of 1914–18 he served in France and Belgium; became chief of the Canadian General Staff in 1929 and was president of the National Research Council of Canada from 1935 to 1939. In 1930–40 he com-

manded the 1st Division of the Canadian Overseas Force.

MacNEIL, măk-nēl′, **Hermon Atkins,** American sculptor: b. Chelsea, Mass., 1866; d. New York City, Oct. 2, 1947. He was graduated at the Massachusetts State Normal School in 1886; and later spent two years in study under Henri M. A. Chapu at Julien Academy, and two years under Jean A. J. Falguière at the Ecole des Beaux Arts in Paris. He was engaged in important decorative work for the expositions at Chicago, Paris, Buffalo, and Panama. He executed the spandrels on the portico of the national pavilion at the Paris Exposition, where he exhibited the groups *The Sun Vow* and the *Last Act of the Moqui Snake Dance.* The main cascade fountain at the Saint Louis Exposition was his work, and he served on the jury of awards. Among his other work may be mentioned *The Coming of the White Man* (City Park, Portland, Oreg.); *McKinley Memorial* (Columbus, Ohio); *General Washington* (Washington Arch, New York). His work is represented at the Art Institute, Chicago; Peabody Institute, Baltimore; Cornell University; the Metropolitan Museum, New York; and Johns Hopkins University.

MacNEVIN, or **MACNEVEN, William James,** American physician: b. Ballynahowne, County Galway, Ireland, March 21, 1763; d. New York, July 12, 1841. When 12 years old he was placed in the care of his uncle, Baron O'Kelly MacNevin, court physician in Austria, and he received his education at the universities of Prague and Vienna, taking his medical degree at Vienna in 1784. He then returned to Ireland and engaged in practice at Dublin. He was arrested with Thomas Addis Emmet in 1798 and imprisoned for four years; joined the Irish Legion under Napoleon and after three years came to the United States and practiced medicine. In 1808 he was professor of obstetrics in the College of Physicians and Surgeons, New York City, and in 1811 professor of materia medica. He was author of *Rambles through Switzerland* (1803); *Chemical Examination of the Mineral Waters of Schooley's Mountain* (1815); *Exposition of the Atomic Theory of Chemistry* (1819).

McNICHOLAS, John T., Roman Catholic archbishop: b. Kiltamagh, County Mayo, Ireland, Dec. 15, 1877; d. Cincinnati, Ohio, April 22, 1950. He was brought to the United States in 1881, and educated at St. Joseph's College, Philadelphia; St. Rose Priory, Springfield, Ky., and St. Joseph's College, Somerset, Ohio. He was ordained priest in 1901; was lector of sacred theology, Minerva University, Rome, in 1904, and in 1904–1905 was a professor at the Dominican House of Studies, Somerset, Ohio; at Washington, D.C., 1905–1909; was pastor of the Church of St. Catherine of Siena, New York City, 1913–1916, and archbishop of Cincinnati in 1925. Of wide civic interests he was appointed chairman of the board of the National Catholic Welfare Conference in 1946. He was the first episcopal chairman of the Legion of Decency.

McNUTT, măk-nŭt′, **Paul Vories,** vō′rēz, American lawyer and public official: b. Franklin, Ind., July 19, 1891. He was graduated from Indiana University, 1913, and from Harvard Law School, 1916. He was assistant professor of law at Indiana University 1917–1919; became professor, 1919, and was dean of the law school, 1925–1933. He was governor of Indiana, 1933 to 1937; high commissioner to the Philippines, 1937–1939; federal security commissioner, 1939–1945; also director of Defense, Health and Welfare Services, 1941–1943; and chairman of the War Manpower Commission, 1942–1945. He then returned to the Philippines as high commissioner, and in 1946 was made ambassador to the islands, serving until 1948. He served in World War I as an artillery officer, and was national commander of the American Legion, 1928–1929. He has been decorated by Poland, France and the Philippines. He now practices law in New York and Washington.

MACOMB, mâ-kōm′, **Alexander,** American general: b. Detroit, Mich., April 3, 1782; d. Washington, D.C., June 25, 1841. He entered the United States Army in 1799 as a cornet of cavalry, and in 1812 held the rank of lieutenant colonel of engineers, and adjutant general of the army. In January 1814 he was promoted brigadier general and placed in command of that part of the northern frontier bordering on Lake Champlain. At Plattsburg, on Sept. 11, 1814, he sustained the attack of a greatly superior British force under Sir George Prevost, which, after the defeat of the British squadron on Lake Champlain on the same day, retreated to Canada. For his firmness and courage on this occasion he was commissioned a major general, and received the thanks of Congress and a gold medal. In 1835 he succeeded to the office of commander in chief of the army, which he held until his death. He wrote a *Treatise on Martial Law and Courts Martial, as Practised in the United States* (1809).

MACOMB, Ill., city and McDonough County seat, altitude 702 feet, 202 miles by rail southwest of Chicago, with a privately owned airport. Located in a farming region, it makes porcelain electrical insulation, poultry equipment, pottery and stoneware, milk products, and automobile license plates. The public library is well stocked. The city is the seat of the Western Illinois Teachers College, with nine buildings on a 290-acre campus. Settled in 1830, Macomb was named for Gen. Alexander Macomb (q.v.), who commanded the United States Army from 1835 to the time of his death. It was incorporated as a town in 1830, and as a city in 1856; has a mayor and council, and a city-owned water-supply system. Pop. (1930) 8,509; (1940) 8,764; (1950) 10,586.

MACON, mā′kŭn, **Nathaniel,** American statesman: b. Warren County, N. C., Dec. 17, 1758; d. there, June 29, 1837. He was educated at the College of New Jersey, now Princeton; in 1776 he left college and served in the New Jersey militia. During the following three years he studied law; from 1780 he served as a common soldier in the Continental Army till the provisional treaty of peace in 1782, refusing any pay or military distinction. When the Constitution of the United States was submitted to North Carolina, he opposed it, asserting it bestowed too much power on the government, and made it in effect independent of the state. He never lost this dislike of the Constitution, and had unlimited confidence in the capacity of the people for self-government;

he was a strong opponent of the Alien and Sedition Acts. He was a member of the United States House of Representatives from 1791 to 1815, serving as speaker from 1801 to 1807, and of the Senate from 1815 to 1828, when he resigned. In 1835 he was president of a convention called to revise the North Carolina constitution.

MACON, mä-kôN, city, France, capital of the Department of Saône-et-Loire, situated on the Saône River and the main railway line between Paris and Marseille, 38 miles north of Lyon. A bridge of 12 arches crosses the river to the suburb of St.-Laurent. The Cathedral of St.-Vincent, built in the 12th and 13th centuries, was destroyed during the French Revolution, but part of it is still used as a chapel, and the façade and towers remain. The modern church of St.-Pierre is a Romanesque structure with two fine spires and a three-naved basilica. The seat of the prefecture dates from the 17th century, and the city hall from the 18th century. There is in the city a statue of Alphonse de Lamartine, the poet, who was born here in 1790.

Mâcon was the Roman Matisco Aeduorum. It became part of the royal domains in 1238, but from 1435 to 1477 belonged to the Duchy of Burgundy. In the 16th century it was a stronghold of the Huguenots. It suffered severely in various invasions. It is the seat of a prefecture and has courts of the first instance and of commerce. The city has important commercial and manufacturing interests. It enjoys a large trade in Burgundy wines and manufactures supplies for the wine trade. Other products are bicycle parts, hardware, rennet, shirts, and grape juice. Pop. (1946) 18,221.

MACON, mā'kŭn, city, Georgia, seat of Bibb County, situated at an altitude of 335 feet, at the head of navigation of the Ocmulgee River, 92 miles by highway southeast of Atlanta. It is served by the Georgia, the Central of Georgia, the Georgia Southern & Florida, the Southern, and the Macon, Dublin & Savannah railroads, and by federal and state highways. The municipal airport, Cochran Field, 9 miles southeast of the city, is served by the Eastern, Delta, and Southern airlines.

Industry and Trade.—The country surrounding Macon produces peaches, vegetables, corn, watermelons, livestock, and cotton, and there are pine forests and deposits of kaolin. (In colonial times, Georgia kaolin was shipped to England for use in the Wedgwood potteries.) On these resources, and on the power derived from the Ocmulgee's drop of 90 feet in the 7 miles above the city, Macon's industries are based. There are a dozen cotton mills, whose varied products include yarn, twine, duck, tire fabric, hosiery, and underwear, as well as several large cottonseed oil plants. In addition, there are flour mills, canneries, meat-packing plants, and factories producing paper, containers, acoustical and insulation materials, brick, tile, concrete, chemicals, fertilizers, and farm implements. Lumber, sash and doors, venetian blinds, crates and baskets, furniture, creosoted timber, and prefabricated houses are also produced locally. Sawmill equipment is a feature of the city's machine shops, and most of the railroads that enter Macon have shops here. A large circus and some racing stables make the city their winter quarters. Macon is a shipping point and has a large wholesale trade.

Government.—Macon is governed by a mayor and a council of 15 aldermen. In 1911 the state legislature authorized it to own and operate its waterworks and to introduce a civil service system for its police and fire departments.

Buildings, Cultural Facilities, and Other Points of Interest.—The City Hall, built in 1836 in the prevailing Greek Revival style of the city's older structures and remodeled in 1935, served as the state capitol for four months in the winter of 1864–1865. The 4,000-seat Municipal Auditorium, which has a copper-covered dome 156½ feet in diameter, was built in 1925. There are historical murals in the Washington Memorial Library building (1919; library, 1874) and in the Citizens and Southern National Bank (1933).

The city has a stadium and several parks: Baconsfield, along the left bank of the river; Central City, in the southeast, with the grounds of Luther Williams Baseball Park and the quarters of the Georgia State Exposition (held annually in October); and Tattnall Square (18 acres), in the southwest corner. South of this square is the campus of Mercer University (q.v.), a Southern Baptist institution which moved here from Penfield in 1871. On the same street (College Street) is Wesleyan Conservatory, the music and fine arts department of Wesleyan College (q.v.), chartered in 1836. The college opened in Macon in 1839, but in 1928 all departments but the conservatory were moved to Rivoli, 7 miles to the northwest, where a dozen Georgian colonial buildings were erected on a 170-acre campus. Georgia Baptist College for Negroes, a coeducational institution founded in 1889, is 5 miles northeast of the city on a 205-acre campus; 30 acres formerly belonging to the college are now a city recreation park. Georgia Academy for the Blind, two miles west of the city, was begun by private gifts in 1851 and taken over by the state in the following year; the present building was erected in 1906.

Macon was the birthplace of Sidney Lanier (q.v.), poet and musician, and Georgia's best-known man of letters. The Lanier home is marked by a marble tablet. Several residences in the city are good examples of the Greek Revival style: the Baber House, built before 1840 and used since 1920 as a clinic; the Cowles-Walker House (1830), now owned by the Scottish Rite Masons; the Cowles-Bond-O'Neal House (1836); the H-plan Coleman-Speer-Birdsey House (1840), similar to Stratford Hall, Virginia; and the particularly fine Ralph Small House (1846).

Macon's streets are planted with crape myrtles, palmettos, and roses. Annually in the spring the Bibb County Camellia Show and the Bibb Flower Show are held in the city. At Porterfield, 8 miles to the south, are fine test gardens of roses.

The Macon area contains numerous prehistoric remains representing several stages of Indian culture. Just outside the city on the southeast is the Ocmulgee National Monument. In the farther part of the monument is the Lamar Mounds and Village Site, consisting of a conical and pyramidal mound, both apparently temple sites, and of traces of houses 20 to 25 feet square which had thatched cane roofs covered with clay and puddled clay floors. The pottery found here is glossy, with paddle-marked designs. Nearer the city is the Macon Plateau, which has four

mounds, a council chamber 42 feet in diameter with 50 clay seats around the wall, and a well-preserved prehistoric cornfield. One of the plateau mounds was decorated on its sides and top with bright-colored clay bands.

There are other interesting Indian remains in Brown's Mount, which has a smaller council room with built-in seats, and Shell Rock Cave, where red flint and jasper implements and many marine fossils have been found.

History.—By 1805 the Indians had ceded to the state all the land between the Oconee and Ocmulgee rivers. A military post, Fort Hawkins, was built on the east side of the Ocmulgee in 1806. (The spot is marked by a blockhouse erected in 1938.) Here troops gathered for Andrew Jackson's southern campaign in the War of 1812, and here came the first settlers from North Carolina in 1818. They named their village Newtown. In 1821 the Indians ceded to the state the lands west of the Ocmulgee, and two years later a settlement was established across the river and named in honor of Nathaniel Macon (q.v.), the North Carolina patriot. The Macon *Telegraph* was founded in 1826. Three years later, Newtown became a part of Macon, and in 1832 the city was incorporated.

Macon became an important point for shipping cotton downstream to Darien by oared flatboats. In the 1840's a railroad was completed connecting Macon with Savannah, and another north to Atlanta, and soon railway bridges blocked river traffic above the city. In the 1850's, Macon grew rapidly and made bids for direct trade with Europe. In 1860 it held the Belgian Fair and Cotton Planters' Exposition. In the Civil War the city was a Confederate gold depository, a center for commissary supplies, and one of Georgia's four munition-making cities. In 1864 it was threatened, but not taken, by Union forces; it was finally occupied only after the armistice in April 1865. In that year the *Wesleyan Christian Advocate* was moved to Macon from Charleston, S. C. The first large-scale textile mills were built in the 1870's. The Macon *News* was established in 1884 (with a Sunday edition founded in 1930 it is now under the same management as the *Telegraph*). The city limits were extended in 1900. In 1906 the river levee was improved, and flood danger minimized. By 1910 the city had a population of 40,665. In the Spanish-American War one of Georgia's six training camps was at Macon, and in World War I Camps Harris and Wheeler were established here. By 1940 the population numbered 57,865. In World War II, Camp Macon, second largest in the state, was established. Warner Robins Air Technical Service Command (now Robins Air Force Base) was set up near the city. Pop. (1950) 70,252.

Consult *The Macon Guide and Ocmulgee National Monument* (Macon 1939).

MACON, mā'sˈn (originally MAÇON), bayou, Louisiana. It rises in southeastern Arkansas and flows south through Louisiana to its junction with the Tensas River in Franklin Parish. Its course of approximately 150 miles is partly navigable.

MACON, mā'kŭn, city, Mississippi, seat of Noxubee County, situated at an altitude of 180 feet, on the Noxubee River and the Gulf, Mobile and Ohio Railroad, 28 miles south-southwest of Columbus. In an agricultural area, the city has plants producing milk, cheese, cottonseed oil, and lumber. It has a public library, two high schools, and a hospital. Macon was incorporated in 1836 on land ceded by the Choctaw Indians in 1833. The city is governed by a mayor and a board of aldermen. Pop. (1950) 2,241.

MACON, city, Missouri, seat of Macon County, located at an altitude of 865 feet, on the Chicago, Burlington & Quincy and the Wabash railroads, 23 miles north of Moberly. It is the shipping center for the surrounding agricultural and coal-producing region. Pleasantly situated in a grove of maple trees, the city is the seat of an osteopathic sanatorium specializing in the treatment of nerve diseases, and has a public library and a municipal park. The town of Macon, which was named for Nathaniel Macon (q.v.), was founded in 1856. Three years later it merged with the adjoining town of Hudson to form Macon City, later called Macon. The city became the county seat in 1863. Pop. (1950) 4,152.

MACORIS, the short form of SAN PEDRO DE MACORÍS (q.v.).

MACOUN, John, Canadian botanist: b. Maralin, County Down, Ireland, April 17, 1832; d. Ottawa, July 18, 1920. He went to Canada in 1850 and became a farmer. From 1868 to 1879 he was professor of botany and geology at Albert College, Belleville, Ontario. He was appointed explorer for the Canadian government in the Northwest Territories in 1879, and botanist to the Geological Survey of Canada in 1882. Three years later he became assistant director and naturalist of the survey, a position he held until his death. Macoun was a charter member of the Royal Society of Canada. His published works include *Manitoba and the Great North West* (1882); *The Forests of Canada and Their Distribution* (1895); catalogues of Canadian plants and birds; and an *Autobiography,* published posthumously in 1922.

MacPHAIL, Agnes Campbell, Canadian politician: b. Proton Township, Grey County, Ontario, March 24, 1890. She was educated at the Collegiate Institute, Owen Sound, Ontario, and the Collegiate Institute and Normal School, Stratford, Ontario, and became a teacher. In 1921 she was elected as a member of the United Farmers of Ontario Party to the Canadian House of Commons, the first woman to achieve this distinction in Canada. Re-elected in 1925, 1926, 1930, and 1935, she later became a member of the Co-operative Commonwealth Federation of Canada. In 1948 she was elected to the legislature of Ontario.

MacPHAIL, SIR Andrew, Canadian physician and writer: b. Orwell, Prince Edward Island, Nov. 24, 1864; d. Montreal, Sept. 23, 1938. He was educated at Prince of Wales College, Charlottetown, and at McGill University, where he received his B.A. degree in 1888 and his M.D. and C.M. degrees in 1891. He was principal of Fanning Grammar School in 1882–1885, and engaged in journalism from 1889 to 1893. From 1895 to 1906 he was pathologist to the Western Hospital and Verdun Hospital for the Insane. From then until his retirement in 1937 he was professor of the history of medicine at McGill

University. He became a fellow of the Royal Society of Canada in 1910 and was knighted in 1918. During World War I he served as a medical officer. His published works include *Essays in Puritanism* (1905); *The Vine of Sibmah* (1906); *Essays in Politics* (1909); *Essays in Fallacy* (1910); *Official History of the Canadian Forces in the Great War; the Medical Services* (1925); *Three Persons* (1929); *The Bible in Scotland* (1931); and *The Master's Wife*. He also translated Louis Hémon's *Maria Chapdelaine* (1921).

MACPHEE, John Joseph, American neurologist: b. Prince Edward Island, Canada, July 8, 1860; d. New York, N. Y., Feb. 18, 1941. He was educated at Prince of Wales College, Charlottetown, and at the University of Vermont, receiving his M.D. degree in 1890. From 1891 to 1894 he was pathologist at the Post-Graduate Medical School in New York City, and then became professor of nervous and mental diseases at the New York Polyclinic Medical School and Hospital. He also served as consulting neurologist at St. John's Hospital, Brooklyn; Beth Israel Hospital, New York; and St. Francis Hospital, New York. He contributed numerous articles to medical periodicals.

MACPHERSON, Sir David Lewis, Canadian statesman: b. Castle Leathers, near Inverness, Scotland, Sept. 12, 1818; d. at sea, Aug. 16, 1896. He was educated at the Royal Academy in his native city, and moved to Canada in 1835. In 1842 he became a partner in a forwarding firm in Montreal, and in 1851 secured with others a charter for a railway from Montreal to Kingston, the beginning of the Grand Trunk Railway. In 1872 he became president of the Interoceanic Railway Company, the rival of the Canadian Pacific in competition for the transcontinental railway charter. He sat in the Legislative Council of Canada from 1864 to 1867, when he entered the Dominion Senate, becoming its speaker in 1880. From 1883 to 1885 he served as minister of the interior. He was knighted in 1884. He was the author of several pamphlets on finance.

McPHERSON, Edward, American journalist: b. Gettysburg, Pa., July 31, 1830; d. there, Dec. 14, 1895. After his graduation from Pennsylvania (now Gettysburg) College in 1848, he studied law but soon entered journalism, becoming editor of the Harrisburg *American* in 1851. For the next 44 years he was connected with various Pennsylvania newspapers, including the Philadelphia *Press* (1877–1880) and the Gettysburg *Star and Sentinel* (1880–1895). He served as a member of Congress for two terms and as clerk of the House for 16 years. He was also active in the Republican Party and was the author of several valuable political source books including *The Political History of the United States of America During the Great Rebellion* (1864); and *The Political History of the United States of America During the Period of Reconstruction* (1871). He published the *Political Manual* annually from 1866 to 1869, and the *Handbook of Politics* biennially from 1868 to 1894.

MACPHERSON, James, Scottish author and translator: b. Ruthven, Inverness, Oct. 27, 1736; d. Belville in Badenoch, Inverness, Feb. 17, 1796. He studied at King's College and Marischal College in Aberdeen, and at Edinburgh University. After he published *Fragments of Ancient Poetry, collected in the Highlands of Scotland, and translated from the Gaelic or Erse Language* (1760), a subscription was raised to enable him to collect additional specimens of national poetry. As the fruit of his research, he produced *Fingal, an Ancient Epic in Six Books* (1762), followed by *Temora* (1763), and a collected edition entitled *The Works of Ossian* (1765), all alleged translations from Gaelic originals ascribed to the 3d century bard Ossian (q.v.).

The question of the authenticity of the works provoked a violent controversy, Dr. Samuel Johnson being one of Macpherson's greatest opponents. It may be concluded that Macpherson's prose epics were founded on traditional narratives current in the Highlands; but the date of the oldest of the lays is comparatively modern, and it is now impossible to ascertain the precise extent of his obligations to Gaelic bards. Macpherson never made any serious attempt to vindicate himself against the charge of forgery. He had a life allowance from the government, was agent to Mohammed Ali, nabob of Arcot, and held a seat in the House of Commons from 1780 until his death. He was the author of several historical works and of an inadequate translation of Homer's *Iliad*. He was buried in Westminster Abbey.

McPHERSON, James Birdseye, United States army officer: b. Clyde, Ohio, Nov. 14, 1828; d. Atlanta, Ga., July 22, 1864. He was graduated from the United States Military Academy in 1853. Appointed brevet 2d lieutenant of engineers, he became assistant instructor of practical engineering at West Point (1853–1854). After working on the construction of defenses for New York Harbor and the improvement of the Hudson River, he was given charge of the construction of Fort Delaware and of the defenses of Alcatraz Island in San Francisco Bay.

At the opening of the Civil War, he applied for active employment in the field. In May 1862, he was appointed brigadier general of volunteers and was with Gen. Henry W. Halleck at the siege of Corinth. For his services on this occasion he was made major general of volunteers in the following October. He took an important part in the siege and capture of Vicksburg and in consequence was promoted to the rank of brigadier general in the regular army, Aug. 1, 1863. In March 1864, he was made commander of the Army of the Tennessee and performed distinguished services in the campaign of Georgia. The following July he commanded in the engagement around Atlanta and was killed during a reconnaissance.

McPHERSON, city, Kansas, seat of McPherson County; altitude 1,495 feet; 27 miles northeast of Hutchinson; served by the Chicago, Rock Island and Pacific; the Union Pacific; the Missouri Pacific; and the Atchison, Topeka and Santa Fe railroads. The surrounding area raises wheat and corn. The city is the central Kansas trade center for rich oil and gas fields, discovered in the region in 1929. Important industries include oil refinery plants, oilfield supply houses, flour and feed mills, and cement mills. Mc-

Pherson College (q.v.) and Central College are located in the city. Government is by commission. The city was incorporated in 1874. Pop. (1940) 7,194; (1950) 8,689.

McPHERSON COLLEGE, an accredited, coeducational institution, located in McPherson, Kans. It was chartered in 1887 and opened in 1888. The college is the property of the Church of the Brethren, sometimes known as the Dunkers. It offers courses leading to the bachelor of arts and bachelor of science degrees. The campus covers about 13 acres.

McQUAID, mȧ-kwād′, **Bernard John,** American Roman Catholic prelate: b. New York City, Dec. 15, 1823; d. Rochester, N. Y., Jan. 18, 1909. After studying in Canada, he completed his course at St. John's College, Fordham, N. Y., where he was graduated in 1843, and for the next three years held the position of tutor. He studied theology first with the Lazarists of New York City and later at St. John's College, Fordham, being ordained priest January 1848. Having built churches at Morristown and Springfield, N. J., he was engaged upon one at Mendham when summoned to the newly created diocese of Newark, N. J., 1853. In 1856, Father McQuaid founded Seton Hall College at Madison, N. J. (now Seton Hall University, located in South Orange, N. J.), and was its first president, retaining the office for 10 years. He was consecrated first bishop of the diocese of Rochester, N. Y., by Archbishop John McCloskey in New York City, July 12, 1868. With characteristic energy he discharged his episcopal duties, the cause of Catholic education ever appealing to him as one of paramount importance. With a view to advancing it, he invited the Sisters of St. Joseph to conduct new parochial schools in his diocese and likewise founded St. Andrew's Preparatory Seminary.

MACQUARIE ISLANDS, mȧ-kwŏr′ĭ, a group of small islands in the South Pacific Ocean, about 850 miles southeast of Tasmania, Australia, by which it is administered. The largest island, also called Macquarie, has an area of about 89 square miles. The crest of a submarine mountain, it rises to a height of about 1,400 feet. It is rocky and has some small glacial lakes. Formerly it was good seal-hunting ground, but the seals have been practically exterminated. Penguins and other sea fowl abound, and there are large herds of sea elephants.

The islands were discovered in 1810 and until the destruction of the seals were visited by the sealers. Its only inhabitants at the time it was made a base of the Mawson Australasian Antarctic Expedition (1911–1914) were a few men stationed there for the purpose of rendering sea elephant and penguin blubber. There is now a permanent weather and relief station on the island and there are also radio stations.

Consult Mawson, Sir Douglas, *The Home of the Blizzard,* 2 vols. (1914).

MacQUEARY, mȧ-kwē′rĭ, **Thomas Howard,** American educator: b. Charlottesville, Va., May 27, 1861; d. St. Louis, Mo., July 1930. He was graduated from the Episcopal Theological Seminary at Alexandria, Va., in 1886, took orders in the Protestant Episcopal Church, and in 1887 became rector at Canton, Ohio. His religious views having undergone a radical change, he was tried by an ecclesiastical council for denial of miracles and suspended from the ministry for six months. He accordingly resigned from it in September 1891, and was for some time in the Universalist ministry. He returned to college for special work and in 1898 took his M.A. degree at the University of Minnesota, later (1901) finishing the work for the Ph.D. degree in history and economics at the University of Chicago, although he did not publish his thesis and take the degree. He founded Unity House Social Settlement in Minneapolis; from 1900–1906 was superintendent of the Parental School in Chicago; and from 1906 was head of the department of history and head assistant in Soldan High School, St. Louis, Mo. He also lectured frequently for Chautauquas and other societies. He was the author of *The Evolution of Man and Christianity* (1889), and *Topics of the Times* (1891).

McQUILLEN, John Hugh, American dentist: b. Philadelphia, Pa., Feb. 12, 1826; d. there, March 3, 1879. He began the study of medicine and dentistry in 1847, engaged in the practice of dentistry in 1849, took his M.D. at Jefferson Medical College in 1852, and his D.D.S. at the Philadelphia College of Dental Surgery in 1853. He became professor of operative dentistry and dental pathology at the Pennsylvania College of Dental Surgery in 1857. In 1863 he was instrumental in securing a charter for the Philadelphia Dental College and he was from that time until his death its dean and professor of anatomy, physiology, and hygiene. He was president of the American Dental Association, the Pennsylvania Association of Dental Surgeons, and the Odontographic Society of Philadelphia. From 1865 to 1872 he was editor in chief of the publication *Dental Cosmos.*

MACRAUCHENIA, măk-rô-kē′nĭ-ȧ, a genius of three-toed, long-necked fossil ungulates, from the Pleistocene of South America. They form a connecting link between the palaeotherium and the camel family. In form they resemble the llama, but are as large as a hippopotamus. Their remains have been gathered from the pampas of Argentina and Bolivia.

MACREADY, măk-rē′dĭ, **William Charles,** English tragedian: b. London, March 3, 1793; d. Cheltenham, April 27, 1873. His father was the manager of several small theaters. William Charles received his education at Rugby, and originally had the intention of adopting one of the learned professions; but his father's failure in management changed his plans for a career, whereupon he joined his father's troupe then acting in Birmingham. He appeared there for the first time in 1810 in the character of Romeo, in which he was successful. On Sept. 16, 1816, he made his first appearance on the London stage at Covent Garden Theatre, acting the role of Orestes in *The Distressed Mother.* He did not achieve an immediate triumph in London, but gradually rose in popular favor. In 1819 his portrayal of Richard III established him as a leading tragedian, and the following year his Virginius gained him tremendous praise. In 1826 he made his first tour in the United States, making his debut in New York City on October 2 of that year as Virginius. From 1837 to 1839 he was manager of Covent Garden.

In 1841 he became a theatre manager of Drury Lane, but met with no success, so that he resigned at the end of the second season. His managership at Drury Lane had brought upon him considerable financial loss, to repair which he made his third visit to America (1848–49). There he was involved in an unfortunate quarrel with the American actor, Forrest, which in May 1849 culminated in a riot at the Astor Place Opera House, New York, at which Macready was appearing as Macbeth, and in consequence was obliged to leave the country. On his return to London he gave some farewell performances, and then retired from the stage in 1851.

McREYNOLDS, măk-rĕn'oldz, **James Clark,** American lawyer, cabinet officer and jurist: b. Elktown, Ky., 3 Feb. 1862. He was graduated at Vanderbilt University in 1882 and from the law department of the University of Virginia in 1884. He engaged in law practice at Nashville, Tenn., attaining a distinguished reputation; and in 1900–03, without relinquishing his practice, he was professor at the Law School of Vanderbilt University. While of Democratic party affiliations he was appointed Assistant Attorney-General under the Roosevelt administration in 1903–07, after which he engaged in law practice in New York. He was on several occasions retained as counsel by the United States in service connected with the application of the anti-trust laws, his part in dealing with the tobacco trust and with the anthracite coal dealers and the railroads being especially prominent. In 1913 he was appointed United States Attorney-General by President Wilson, succeeding Attorney-General Wickersham. While in office the cases of the Union and Southern Pacific Railroad merger, the International Harvester Company, the American Telephone and Telegraph Company, the Reading Company and the New York, New Haven and Hartford, under the Sherman Anti-Trust Law, came under his direction. He was appointed associate justice of the Supreme Court of the United States in August 1914 and took his seat in October.

MACROBIUS, mą-krō'bĭ-ŭs, **Ambrosius Aurelius Theodosius,** Latin author of the 5th century A.D. The country of his birth is uncertain, but it is inferred from the fact that he speaks of Latin as a foreign tongue to him that he was probably a Greek. He was the author of a miscellaneous work entitled 'Saturnalia,' curious for its criticisms, and valuable for the light it throws upon the manners and customs of antiquity; a commentary on Cicero's 'Somnium Scipionis,' in two books, valuable for the exposition it affords of the doctrines of Pythagoras with respect to the harmony of the spheres; and a treatise, 'De Differentiis et Societatibus Græci Latinique Verbi.' Consult Von Jan, 'Macrobius'; and Eyssenhardt, 'Macrobi Opera'; also Wissowa, G., 'De Macrobii Saturnaliorum Fontibus' (Breslau 1880).

MACROCOSM. See MICROCOSM.

MACROCYSTIS, măk'rō-sĭs'tĭs, a genus of brown seaweed of the family *Laminariaceæ,* generally known as giant kelp. It is common throughout the southern temperate zone and along the Pacific Coast of the United States. It has a much-branched root from which rises many filiform simple or branched stems without leaves below, but bearing numerous lance-like leaves above. The stems reach the greatest length known in the vegetable kingdom. Observations by Hooker near the Crozet Islands report specimens fully 700 feet long; and other authorities state that a length of 900 feet is sometimes attained.

MACROTHERIUM, a genus of extinct ungulate mammals, in some cases of gigantic size, found most completely in the Miocene deposits of Europe, but also known from China and western North America. It represents the primitive group *Ancylopoda,* which had a wide geographical range in the Miocene and Pliocene epochs when it became extinct. The structure of the curiously twisted feet so much resembles that of the ground-sloth that for a long time the macrotheres, as well as their companion, but more generalized, genus *Homalodontotherium,* were regarded as edentates. Consult Woodward, 'Vertebrate Palæontology' (1898).

MACRURA. See DECAPODA.

McTYEIRE, măk-tăr', **Holland Nimmons,** American Methodist Episcopal bishop: b. Barnwell County, S. C., 28 July 1824; d. Nashville, Tenn., 15 Feb. 1889. He was graduated at the Randolph-Macon College, Virginia, in 1844, and in 1845 entered the ministry, joining the Virginia Conference. In 1846 he was assigned to Saint Francis Street Church, Mobile, Ala., and after serving in the churches at Demopolis, Ala., and Columbus, Miss., he was transferred to the Louisiana Conference. He was editor of the New Orleans *Christian Advocate* in 1851–58, and from 1858 until its publication was interrupted by the Civil War he edited the Nashville *Christian Advocate.* During the war he served as pastor of the church at Montgomery, Ala. He was elected bishop in 1866, and in 1873 he became president of the board of the newly-founded Vanderbilt University. He was senior bishop for some time before his death. Author of 'Duties of Christian Masters' (1851); 'Catechism on Church Government' (1869); 'Manual of Discipline' (1870); 'History of Methodism' (1884); 'Passing Through the Gates' (1889), etc.

MACŪ, mă'koo, a nomadic Indian tribe of the Amazon region. They range through northwestern Brazil, more particularly along the Rio Negro. They are of the lowest type of savages of South America, provide neither shelter nor clothing and plant no crops. They live by hunting and fishing, are hostile and apparently have no connection with other tribes. A report of their condition was made by Theodor Koch-Grunberg in 'Anthropos' (Vol. I, pp. 877–906, 1906).

MacVEAGH, măk'vā, **Franklin,** American cabinet officer, brother of Wayne MacVeagh (q.v.): b. near Phœnixville, Pa., 1837; d. 6 July 1934. He was graduated at Yale in 1862 and took his LL.B. at Columbia University in 1864. He was admitted to the bar in 1864; and in 1864–66 was engaged in practice in New York. His health failing he went to Chicago in 1866 and there engaged in the wholesale grocery business. After the great fire in 1871 he established the firm of Franklin MacVeagh and Company, wholesale grocers, and he also became connected with various banking and

manufacturing interests. He became president of the Citizens' Association of Chicago in 1874 and was largely responsible for many important reforms. He was Democratic candidate for United States senator against Senator Cullom in 1894 but was defeated. From 1896 he was associated with the Republican party, and in 1909 he was appointed Secretary of the Treasury by President Taft, serving throughout the Taft administration. He was vice-president of the American Civic Association in 1905; served as president of the Chicago bureau of charities and of the Municipal Art League; and was a founder and member of the executive committee of the National Civic Federation.

MacVEAGH, Wayne, American lawyer and diplomat: b. Phœnixville, Pa., 19 April 1833; d. 11 Jan. 1917. He was graduated from Yale in 1853 and was admitted to the bar in 1856. He was district attorney of Chester County 1859–64, became prominent as a Republican leader, and conspicuous in his profession, and in 1870–71 was Minister to Turkey. He was an active opponent of «machine politics» and in 1872 led the Republican opposition to Simon Cameron, his father-in-law. He was chairman of the «MacVeagh Commission» sent by President Hayes to Louisiana in 1877 to act as the President's unofficial representative and aid in adjusting political differences there. He was Attorney-General of the United States, March to September 1881, and was Ambassador to Italy 1893–97. In 1903 he was chief counsel of the United States in the Venezuela arbitration before The Hague Tribunal.

McVICKAR, William Neilson, American Protestant Episcopal bishop: b. New York, 19 Oct. 1843; d. 28 June 1910. He was graduated at Columbia College (1865); and at the General Theological Seminary (1868). He was ordained deacon (1867) and priest (1868). Being elected coadjutor bishop of Rhode Island, 19 Oct. 1897, he was consecrated 27 Jan. 1898, and on the death of Bishop Clark, September 1903, succeeded to the see.

MACWHIRTER, măk-wĕr'tĕr, **John,** Scottish landscape painter: b. Slateford, near Edinburgh, 27 March 1839; d. London, 28 Jan. 1911. He entered the Trustees' Academy, conducted by Robert Scott Lauder at Edinburgh, when 13 years of age, and at 15 made his first exhibition, 'Old Cottage at Braid,' at the Royal Scottish Academy. At 16 he began his annual tours of Europe in search of material for his canvases, his travels eventually covering all parts of Europe and the United States as well. In 1867 he exhibited six pictures at Edinburgh and was elected to the Royal Scottish Academy. He made his first exhibition at the Royal Academy, London, in 1865, and in 1869 he settled permanently in London. He painted some effective landscapes in California in 1877; was elected associate of the Royal Academy in 1879 and Academician in 1893. His landscapes are naturalistic and their popularity doubtless was enhanced by the tinge of literary significance he succeeded in giving them, together with a certain felicity in the selection of their titles. Among his work are 'The Lady of the Woods' (1876); 'The Three Graces' (1878); 'The Lord of the Glen' (1880); 'The Three Witches' (1886); 'Crabbed Age and Youth' (1899); 'The Fallen Giant' (1901). His work is represented in the Royal Academy diploma gallery; the Walker Art Gallery, Liverpool; and in the municipal galleries at Manchester, Dundee, Aberdeen and Hull. Author of 'Landscape Painting in Water Colors' (1901). Consult Spielmann, H. M., 'The Art of John MacWhirter'; Sinclair, W. M., 'John MacWhirter, R.A.' (*Art Journal Annual,* Christmas, 1903).

MACY, Jesse, American historian: b. Henry County, Ind., 21 June 1842; d. 2 Nov. 1919. He was graduated from Iowa College in 1870. From 1871 to 1885 he was principal of the academy of Iowa College; in 1883–85 was acting professor of history and political science; in 1885–1912 professor of political science, and professor emeritus since 1912. In 1913 he was Harvard Foundation lecturer in French provincial universities. He received the degree of LL.D. from Brown University in 1898, from Grinnell in 1911 and from Oberlin in 1915. He has written 'Civil Government in Iowa' (1881); 'Institutional Beginnings in a Western State' (1883); 'Our Government' (1886); 'A Government Textbook for Iowa Schools' (1887); 'The English Constitution' (1897); 'Political Parties in the United States, 1846–61' (1900); 'Party Organization and Machinery' (1904); 'Comparative Free Government,' with J. W. Gannaway (1915).

MAD ANTHONY, a nickname given to the Revolutionary general, Anthony Wayne (q.v.), on account of the seeming recklessness of his brilliant military feats.

MAD APPLE, the fruit of an American nightshade, especially that called Sodom apple (*Solanum sodomiæ*), the eating of which produces poisonous intoxication.

MAD MULLAH, term applied to Mohammed Ali, the Mahdi, or Moslem Messiah: b. Somaliland, 1843; d. Omdurman, 22 June 1885. In his youth Mohammed was initiated into the mysteries of the occult sciences and sorcery. A study of the Koran and the Arab writings followed in the Marabout school. When quite young the future Mullah was taken with the idea of making the pilgrimage to Mecca, and not content with one journey made the sacred visit three or four times. After his last pilgrimage Mohammed returned to Berbera, but met with small success. Establishing himself in a powerful inland tribe, his ascetic practices and bold demeanor gained for him a reputation for sanctity and spiritual gifts. In 1880 he proclaimed himself Mahdi («the guide,» i.e., in the way of salvation), and in 1881 he proclaimed a Jehad or holy war against the infidel and speedily aroused all the latent fanaticism of the fierce Sudanese tribesmen. From 1881–83 he destroyed nearly every force sent against him; and so threatening did his power become that the evacuation of the Sudan was ordered by the Egyptian government, Wolseley's expedition for the relief of Khartum was too late to effect its purpose, the city was stormed in January 1885 and General Gordon murdered. His death is said to have occurred through poison administered at the hands of a woman he had outraged. His successor, Abd-Allah, carried on the struggle, until the power of Mahdism was finally broken at the battle of

Omdurman in 1898. Consult Darmesteter, *The Mahdi* (London 1885); Hoffmann, *Mahdithum* (Kiel 1899); Müller, E., *Beiträge zur Mahdilehre des Islams* (Heidelberg 1901); Wingate, *Mahdism and the Sudan* (London 1901).

MAD TOM, local name in eastern United States for any of several types of small catfish native to fresh waters. They are long and slender, with mottled skin entirely naked, and have sharp pectoral spines with which a wound about as painful as a bee-sting may be inflicted. There are several varieties, ranging from a few inches to nearly a foot in length. They are known also as stone-cat, owing to their resemblance to the rocky or pebbly bottoms they frequent.

MADACH, mŏ'däch, **Emerich,** or **Imre,** Hungarian poet: b. Also-Sztregova, Jan. 21, 1823; d. there, Oct. 5, 1864. He studied Law, was a notary in his native country and was also active as an orator and journalist. He wrote on archaeology and aesthetics; and both lyric and dramatic verse. His principal works are the two dramatic poems *Moses* (1860); and *The Tragedy of Man* (1860). The latter owes much to *Paradise Lost,* and to *Faust,* but is yet a remarkable performance. Though strongly contemplative in character, it was successfully presented. There is an excellent rendering in German by von der Lech (1888).

MADAGASCAR, măd-à-găs'kẽr, an island in the Indian Ocean, since 1896 a French colony. It is separated by the Mozambique Channel from the southeast coast of Africa, the nearest point being 240 miles distant. It is 980 miles long from Cape Sainte-Marie in the south to Cape Amber (Ambre) in the north, and has an average breadth of 250 miles; greatest breadth 360 miles; total area 228,500 square miles; population (1946 census) 4,058,281. Exclusive of Australia and Greenland, generally classed as continents, it is the third largest island in the world, only New Guinea and Borneo being larger. For administrative purposes, the Comoro Archipelago (q.v.) with several other islands lying adjacent to Madagascar, such as Nossi-Bé and Sainte-Marie, the islands of St. Paul and Amsterdam in the South Indian Ocean, and certain Antarctic islands, are considered dependencies of Madagascar.

The principal towns of Madagascar are the capital, Tananarive, or Antananarivo (pop. 170,000), in the interior; Tamatave (21,000), the largest port on the east coast; Majunga, Fianarantsoa, Diégo Suarez, and Antsirabe.

The Land.—Madagascar consists of an elevated region with an average height of from 3,000 to 5,000 feet overlooked by mountains rising in some cases to over 9,000 feet above sea level. This plateau occupies a much larger proportion of the surface in the north and east than in the west and south; the greater portion of the island south of latitude 23° belongs to a much lower region which does not consist entirely of plains, but is interrupted toward the west by three prominent chains of hills stretching from north to south, one of them apparently in a continuous line about 600 miles in length. The coast has a number of indentations, mostly small, but a few good harbors, being in great part rock, though in some places low and sandy.

The rivers are numerous, but few of them offer the advantages of internal navigation. The chief waterways are on the west and northwest side of the island. The Betsiboka with its affluent, the Ikopa, together measuring 300 miles, may be ascended by light steamers for 100 miles; the Tsiribihina has a somewhat shorter course, but drains by its numerous tributaries a much larger area. The eastern rivers descend from the high land through magnificent gorges, forming a succession of rapids and cascades, the falls in some instances having a descent of 500 feet. There are few lakes of any size as yet known to explorers; one of the largest is Lake Alaotra, measuring 25 miles in length; the others do not reach a length of 10 miles. A chain of lagoons linked by the Pangalane Canal, forms a waterway a short distance inland from the eastern seaboard, extending from Foulpointe to Farafangana (390 miles).

Geologically the elevated region consists almost entirely of granite and other igneous rocks, while the lower region is composed chiefly of secondary formations. The former region is traversed by a line of extinct volcanic craters, some of which show signs of comparatively recent activity. Among the more remarkable fossils are remains of a huge struthious bird, the Aepyornis, whose egg, measuring 12 by 9 inches, is larger than that of any other known bird. Minerals include copper, nickel, lead, iron, gold, large deposits of high carbon content graphite, mica, and numerous precious and semiprecious stones. Coal is found in the west both in the northern and southern parts of the island.

Climate.—The climate is varied; the heat on the coast is often very intense, but on the highlands of the interior the temperature is moderate. The coastal climate is tropical. In the interior the winter is dry and agreeable. The greatest amount of rainfall occurs on the east coast, and especially on the northeast, the part directly exposed to the summer monsoon. The elevated region of the interior and the districts on the west coast are more suitable for Europeans, but owing to the large extent of marsh and lagoon on the east, malarial fever prevails, and is frequently fatal to natives from the interior as well as to Europeans. On certain days in August or September, there may be freezing temperatures in high plateaus but snow is unknown.

The People.—The inhabitants, known by the name of Malagasy, belong to the Malayo-Polynesian stock and speak a Malayan languge. They appear to form substantially a single race, though they have received a considerable intermixture of African blood and a certain amount of Arab intermixture. They are divided into numerous tribes, each having a distinctive name and custom. The Antaimerina (commonly called Hovas) are the predominant tribe; their proper country is the elevated region of the interior, but they extended their sway over nearly the whole island. They were socially divided into three classes: Andriana or nobles; Hovas (in a special and restricted use of the word) or free commoners; and Mainty or slaves. The nobles and slave classes have been abolished by the French. Among the other chief tribes are the Betsimisaraka on the east coast, the Betsileo in the south central region, and the Sakalava on the west and north. In the coast districts the houses of the better class are built of framed

timber with lofty roofs covered with shingles or tiles; the dwellings of the lower classes are constructed of bamboo or rushes, even of clay. In former and more unsettled times the villages were almost always built on the tops of hills, but during the 19th century this precaution was not deemed so indispensable. The principal article of native dress with both sexes is the *lamba,* a piece of cloth about three yards long and two broad, which is folded around the body under the arms, one end being thrown over the shoulder.

Flora and Fauna.—The most striking feature in the vegetation was formerly a belt of dense forest on the east and west of Madagascar. But forest areas greatly decreased during the last century, the high plateaus in particular being almost denuded. There is some virgin forest in Maroansetra and conservation measures are enforced. The stands include many species of lofty palms, hardwooded exogens supplying a great variety of beautifully veined and durable timber, and a large number of trees remarkable for the splendid character of their blossoms. Of all the trees of Madagascar, the most striking is the *Ravenala* or traveler's tree (*R. madagascariensis*). It resembles a palm, its stem being crowned by a semicircle of oblong leaves spread out vertically in a fan shape. It owes its name to the fact that the traveler may supply himself with water by piercing or breaking the lower ends of the leaf stalks.

Madagascar has a singularly local fauna which, although upon the whole related to Africa, is so peculiar to itself that, with a few neighboring islets, it forms a very distinct subprovince of the African region. Its characteristics show plainly that the separation of the island from the continent occured at a very ancient time. Another singular feature is the presence of various forms of animal life represented elsewhere only in Oriental Australian regions; in a few animals, there is a marked resemblance to South American species (for example, the boas). From this fact it has been argued that in early Tertiary times there was a land connection between Madagascar and India and the region thence to Australia, now represented only by the islands of the Malayan Archipelago. (See LEMURIA.) In its mammals, Madagascar is singular in what it lacks, as well as in what it possesses. It has none of the cattle, equine animals, elephants, rhinoceroses, hogs, or even rodents of Africa, except a mouse or two; no lion or true cat or dog of any kind; and no monkeys. On the other hand, it has several small insectivora, closely allied to tropical American species; the great majority of all the lemurs, the few outsiders being in Africa and the Orient; and several viverrine quadrupeds, which take the place of the predatory cats. The modern birds are less striking in their peculiarities, but in the zoological era immediately preceding the present, the island possessed those huge ratite birds, the Aepyornis and its relatives, which gave rise to the story of the roc. Many forms of huge land tortoises were also members of this singular fauna. The fishes, amphibians, reptiles and lower forms are largely peculiar.

Crocodiles are numerous in the rivers and lakes, and many species of lizards, chameleons and tree frogs abound in the forests. Among the insects are numerous brilliantly colored beetles, butterflies, moths, flies, locusts, and spiders, venomous species of the latter as well as scorpions and centipedes being present. See also ZOOGEOGRAPHY.

Agriculture.—About 75 per cent of the 4,000,000 Malagasy inhabitants are farmers. Of the vegetable products grown for food, by far the most important is rice, the staple food of the country; next in importance come manioc or cassava, sweet potatoes, beans, tomatoes, groundnuts, and yams. Ginger, pepper, and indigo grow wild in the woods; cotton, sugarcane, coffee, tobacco, and hemp are cultivated. Humped cattle are found in immense herds, and form a large part of the wealth of the inhabitants; they appear to have been introduced from Africa at a remote period, as the fat-tailed sheep, goats, swine, and horses have been more recently. Under French administration agriculture and cattle raising have undergone considerable expansion. An important part has been played in the settlement of the island by colonists from France. Cattle breeding is especially important. About 1,500,000 hectares of land are under cultivation (1 hectare=2.471 acres).

Industry and Trade.—Graphite, raffia fiber, coffee, manioc, hides, sugar, cloves, vanilla, mica, and canned meats are exported. The chief imports are cotton goods, machinery, iron and steel, cement, fuel oil, and automobiles. Imports for 1946 were 1,352,000 tons valued at 2,121.6 million francs C.F.A. Exports: 132,900 tons valued at 2,777 millions. Mineral exports: 8,900 tons of graphite, also mica and quartz. Other exports included meat and manioc. Phosphate production ceased in 1939. Production of garnet and corundum for abrasives, and rock crystal used for optical supplies, has continued, but exports of precious and semiprecious stones were curtailed by World War II. In general, the Malagasy show much aptitude for the manual arts. As silversmiths, gunsmiths, carpenters, and shoemakers, they rapidly acquire the skill of Europeans. They also make hand-woven textiles, rabanna goods, fine lace, straw hats, and ceramics.

Transportation and Communication.—There are two main railroads on the island. One extends from Tamatave to Tananarive, 230 miles, with one branch line from Tananarive to Antsirabe, 98 miles, and another from Moramanga to Lake Alaotra, 105 miles. The second is the Fianarantsoa-East coast line, 100 miles in length, serving the Betsileo region. There are approximately 15,500 miles of roads on the island, and a network of local airlines, mail being carried by plane.

Government.—Madagascar is divided into five provinces and is administered by a high commissioner assisted by a government council. French decrees of October 1946 (modified in January and March 1947) instituted a Representative Assembly consisting of 36 members—15 comprising French citizens of the first electoral list, which includes some autochthonous voters; and 21, the second electoral list comprising Malagasy who do not have French citizenship status. Five provincial assemblies were established, elected on the basis of the double lists, with representatives of the second list in the majority. The provincial assemblies elect the members of the Representative Assembly. The elections of March 30, 1947, returned to the Assembly (for the second electoral list) 12 members of the Parti des Déshérites Malgaches (favoring close ties with the French), and 9 of the

Democratic Movement of the Malagasy Renovation (desiring a free and independent Madagascar within the French Union). A Court of Appeal and tribunals throughout the provinces provide for native justice, while there are special courts for the administration of French justice.

Education and Religion.—In 1944, there were more than 250,000 children attending public and private elementary schools where the curriculum comprises academic and technical courses. Education is free and compulsory, and instruction in French is obligatory. Instruction is also given in higher schools in practical agriculture, industries, and medicine. Numerous Catholic and Protestant missions and mission schools have long been established; in 1895 it was estimated that there were 450,000 Protestants and 50,000 Catholics in Madagascar. The religion of the great bulk of the people is a kind of fetishism or worship of charms.

History.—Madagascar was known to the traveler Marco Polo at the end of the 13th century and had already been visited for several centuries by the Arabs. In 1506 it was visited by the Portugese, who gave it the name of St. Lorenzo. A number of French settlements were formed, broken up, then re-established at various times, more particularly along the east coast at Sainte-Marie Island, Antongil Bay, Fort Dauphin, and Tamatave. British influence began to be felt after the Napoleonic wars.

Previous to 1810, Madagascar, which had no truly indigenous population, might be said to be divided among numerous tribes who remained almost constantly at war with one another. By the 19th century, the Hovas had gradually extended their supremacy over most of the island. While some of their rulers encouraged the infiltration of European ideas, others yielded to the pressure brought to bear by the Andriana nobles and gave proof of a fear and distrust of strangers which several times led to armed intervention by both the French and British. After several decades of rivalry, the British recognized France's larger interests and predominant rights in the island.

Radama I, a prince of remarkable intelligence, became king of the Hovas in 1810, and began to enforce by right of conquest a claim to the sovereignty of the whole island. He received arms and other assistance from the British, by which he was enabled to carry on his conquests. Christian missionaries began to teach in the capital in 1820. Many converts were made, the Bible was translated into the Malagasy tongue, the language was first reduced to a systematic written form, and printing was introduced. Great improvements had taken place in the manners of the people when Radama died in 1828, and was succeeded by his chief wife, Ranavalona I, a woman of cruel disposition, and opposed to all innovation. The native converts were persecuted, many of them being put to death, and the island was closed to Europeans. This reign of terror ended at last in 1861, when the queen died, and was succeeded by her son, Radama II, who, himself a Christian, reopened the island to European missionaries and traders, and proclaimed the emancipation of the African slaves. He appears, however, to have been a weak prince easily swayed by native and foreign favorites, and he made an unwise grant of extensive territories and privileges to an enterprising French company, an act which lost him the affection of his nobles, and led to his assassination in 1863. His wife Rasoherina was placed on the throne, and the government repudiated the concessions made to the French, offering 1,000,000 francs as compensation. After a quiet and prosperous reign of five years, this queen died, and was succeeded by Ranavalona II in 1868. After she had been elected queen, she and a great number of her courtiers became Christians, and many reforms favorable to enlightenment and humanity were perseveringly carried out. She was succeeded in 1883 by Ranavalona III. The Sakalavas, a large tribe inhabiting the northwest of Madagascar, had previously asked to be placed under France's protection. Queen Ranavalona refused to recognize French interests in that part of the island and this led to hostilities in 1883–1885. The war was terminated by a treaty, under which France acquired protectorate rights over Madagascar; but hostile feeling toward the French again led to war in 1895. Franch forces soon quelled the insurrections and Madagascar was proclaimed a French colony (Aug. 6, 1896). In 1897 the queen was deposed and exiled, first to the island of Réunion and thence to Algiers where she died in 1917. Gen. Joseph Simon Gallieni was named French resident general (1896-1905) with full military and civil powers. He removed Hova governors from all regions inhabited by other tribes and rapidly brought peace to the island.

In 1941, fears were aroused in Great Britain by Japanese official statements concerning the possible occupation of Madagascar by Axis forces. A British expeditionary force established a control zone in Diégo Suarez, May 1941. Five months later they took control of the whole island, the pro-Allied French officials continuing their functions. In December 1942, the French Committee of National Liberation appointed a high commissioner for Madagascar and French sovereignty was restored.

JEAN DE LA ROCHE,
French Colonial Administrator.

MADAME BOVARY. The first and best-known novel of Flaubert, a type and model for the fiction of the next generation, was the first and is probably still the best of minute reproductions of the platitudes of modern life. *Madame Bovary* was published in 1856 when Flaubert was already 35, the fully matured and laboriously executed expression of his effort to make writing a means of emancipation from self. The French literary historian Gustave Lanson considered it "the masterpiece of contemporary fiction." Flaubert's own education had been out of key with his provincial surroundings, and he chose natures similarly out of tune with their environment for the first object of his study, with a painstaking accumulation of "significant little facts" quite in the spirit of Taine's psychology and literary criticism. Flaubert had worked on *Madame Bovary* at least since 1852, "eighteen hours out of the twenty-four," he tells George Sand, and adds, "I seek something better than success, I seek to please myself." The novel attracted immediate and wide attention, presently stimu-

lated by a prosecution of the author for alleged immorality, a celebrated case, ending in a curiously qualified acquittal. The court pleadings and judgment, printed at Flaubert's insistence with subsequent French editions of the novel, throw strange light on the moral ideas of the last decade of the Second Empire.

'Madame Bovary' marks the transition from the fiction of romantic fancy to that of close realistic observation, preferably of the petty, the puerile and the commonplace. The theme is the banality of provincial life, as Flaubert saw and felt it; the lesson is the futility and danger of a sentimental revolt from the commonplace when vulgar souls indulge in romantic aspirations. Briefly the story is this: Charles Bovary, a "medical man," though not an M.D., fatuously good, timidly banal, is shown us first as a dull pupil, then unsympathetically married, then a widower attracted to a farmer's daughter, Emma, the book's chief subject, whom he marries, apparently the less initiated of the two. Emma's convent education beyond her station had been supplemented by romantic poetry and fiction, in Flaubert's opinion a deliberate perversion, whose degrading and immoral results he proposes to show. Charles was happy; Emma ever restlessly reaching out toward a fulfilment of her romantic aspirations. Chance brought her to an aristocratic ball. Dormant emotions were awakened. "She desired at the same moment to die and to live in Paris." Léon, a law student, served her for a platonic attachment, presently to be succeeded by Rodolphe, after Emma had sought sentimental consolation in religion, quite in vain. Rodolphe's carnally-minded courtship, a bitterly ironically parody of romanticism, is successful; but from dreams of bliss Emma is relentlessly drawn down to and below the commonplace. Both weary, Emma again seeks refuge in religion, but meeting the now more sophisticated Léon yields once more, and plunges Charles into debt while still seeming to him more charming than ever, as she descends the last steps of dissimulated corruption. Abandoned by Léon, once more rejected by Rodolphe, she escapes life by poison, holding even beyond death the infatuated love of Charles, who, even though at last undeceived, dies with a lock of her hair in his hand.

Incidental to the story are some admirable character studies of provincial types, notably M. Homais, druggist-demagogue and materialist, incarnation for Flaubert of "triumphant democracy," a by-word for the narrow, provincial philistine, who has given his name to a social species. His counterfoil is the parish priest, Bourrisien, whose cure of souls is a perfunctory, well-meaning, uncomprehending fatuity. More subordinate but strongly individual are the sacristan Lestiboudois, the notary Guillaumin, and the merchant-money-lender Lhereux.

Apart from its subtle psychology 'Madame Bovary' won and holds admiration for its phrases of flashing irony, its vivid narration and fine descriptive passages, but no less for its linguistic euphony, a matter to which Flaubert gave untiring and at times almost morbid attention. Ethically it reflects its author's sombre pessimism. To Flaubert all spiritual aspiration seems foredoomed to failure. For himself he sought forgetfulness in the pursuit of art for art's sake. In this book he presents neither a character to imitate nor an act to admire. Yet 'Madame Bovary' is, in Bourget's phrase, "the very ideal of the literary artist." There are translations by W. Walton and others. Consult Whitehouse, H. R., 'The Life of Lamartine' (2 vols., New York 1919).

BENJAMIN W. WELLS,
Author of 'Modern French Literature.'

MADAME SANS-GENE. (1) The wife of Marshal Lefebvre, a laundress at the time of her marriage to the Marshal (then a sergeant), who was given the name, which means "carefree," because she retained the unconventional manners of her early life. (2) A play by Sardou and Moreau, first presented at Paris in 1893. The personages are Napoleon and the homely characters whom he made his courtiers. (3) An opera, first presented at the Metropolitan Opera House, New York City, 25 Jan. 1915.

MADDER, (1) *in botany,* the English name of the plants of the genus *Rubia,* especially *R. tinctorum.* It is a trailing or climbing annual, supporting itself by its leaves and prickles. It is supplied chiefly from Holland, France, Italy and Turkey. The roots are kiln-dried and then threshed; they are then dried a second time, and afterward pounded and stamped in a mill. Indian madder, called also madder of Bengal, is *R. cordifolia.* (2) *In chemistry,* the root of *R. tinctorum* is extensively used in dyeing for the production of a variety of colors, namely, red, pink, purple, black and chocolate. Other species of *Rubia* are also used. It would appear that madder contains a colorific principle — rubian — which, under the influence of a peculiar ferment, termed erythrozym, breaks up into alizarin, purpurin, etc. The colors produced from madder are very stable, the well-known Turkey-red being one of them. Madder also contains certain yellow coloring matters, but they are useless, if not injurious, in the process of dyeing. (See DYES; DYEING). (3) *In pharmacy,* madder is a tonic, diuretic and an emmenagogue. Brown madder, a rich red-brown pigment, prepared from the roots of *R. tinctorum.*

MADDOX, Richard Leach, English physician and chemist: b. Bath, England, 4 Aug. 1816; d. Portswood, Southampton, 11 May 1902. He studied medicine at University College, London, but was graduated M.D. at Edinburgh. In early life he settled and practised his profession in Constantinople, and here first took up the study of photography. He subsequently left the Bosphorus for Smyrna and was a civil surgeon in the military hospitals at Scutari during the Crimean War, and finally settled at Woolston, near Southampton, England. It was during his residence at Woolston, which lasted until 1874, that he worked out the process which has revolutionized the art of photography, by substituting the gelatino-bromide for the collodion plate. With him originated the gelatino-bromide dry plates to take the place of the wet collodion plates which, besides other inconveniences, sometimes produce an atmosphere which is dangerous to the operator's health. There have been more than one claimant to the credit of this discovery, but it has been decided by the *Scientific American* that Dr. Maddox is entitled to all the honor of the invention.

MADEIRA, village, Ohio, Hamilton County, is located 15 miles northeast of Cincinnati (3 miles from the corporate limits), of which it is a residential suburb, on the Baltimore and Ohio Railroad. It is incorporated and has a mayor-council government. Pop. (1950) 2,689.

MADEIRA, mȧ-dēr'ȧ (Port. mȧ-thā'ê-rȧ, mȧ-thā'ê-rȧ), a group of islands in the eastern Atlantic Ocean belonging to Portugal and forming the Portuguese administrative district of Funchal. They lie opposite to and about 360 miles distant from Morocco, off the west coast of Africa, about 535 miles southwest of Lisbon, north of the Canary Islands and southwest of the Azores. They include Madeira and Porto Santo islands and two groups of uninhabited islets, the Desertas and Salvages (or Selvagens), with a combined area of 315 square miles.

The main island, Madeira, is 35 miles long and up to 13 miles wide. It is made up of mountains of volcanic origin the highest of which is Pico Ruivo, 6,056 feet high. The east portion of the island is elevated, but less so than the west. From the central mass steep ridges extend to the coast where they form precipices from 1,000 to 2,000 feet high. These cliffs are indented by a few small bays where richly cultivated valleys approach the water between abrupt precipices or backed by rugged hills, and here are located the villages of Madeira. The most striking features of the mountain scenery are the jagged ridges and the deep gorges which cut through the highest mountains almost to their base.

Wine and sugar are the staple products; sugar cane, sweet potatoes, onions, some cereals, fruit, and cattle for dairying are raised. The chief industries are embroidery, wine making, sugar milling, the manufacture of wicker furniture and baskets, and fishing. The principal exports are Madeira wines and embroideries, wickerwork, bananas, pineapples, dairy products, and fish.

The mean annual temperature of Madeira is 65°F., and the climate from its constant and temperate warmth makes the island a favorite resort of invalids. Funchal, the capital, is a submarine cable station and port-of-call. It has been an Episcopal see since 1514, and has a late 15th century cathedral. Pop. (1950) 54,856.

The Madeiras were known to the Romans under the name of *Purpurariae Insulae*. They were rediscovered in 1418 by the Portuguese navigator, Joãs Gonçalves Zarco, who in 1421 founded Funchal. The name Madeira was given to the principal island because of the magnificent forests of building timber (in Portuguese *madeira*) which covered it. From 1580 to 1640 the islands, with Portugal itself, were under Spanish rule, and twice have been occupied by the British, in 1801 and again in 1807–1814. The British developed the wine industry, and are still the most numerous among foreign visitors to the islands. Pop. (1950) total, 269,179; Madeira Island, 266,245.

MADEIRA, river, Brazil, the most important affluent of the Amazon, formed by the united streams Beni and Mamoré on the frontiers of Brazil and Bolivia. The length from the source of the Mamoré is 2,100 miles.

MADELEINE, Marie Angélique de Sainte, French abbess, prioress of the convent of Port Royal, Paris. See under baptismal name, Arnauld, Jacqueline Marie.

MADELEINE, mȧ-dlĕn', **La**, France, a type station, or rock shelter, of late paleolithic culture in the valley of the Vézère, midway between Moustier and Les Eyzies. The Madelenian, or Magdalenian, epoch in archaeology was named from this cave.

MADELEINE, La, a church in Paris, in a square of the same name, begun in 1764. It was remodeled and changed after the Revolution, and was completed and consecrated in 1842. The church is built in the form of a Greek temple and is 100 feet high, 354 feet long and 141 feet wide. The bronze doors by Henri de Triqueti are 35 feet high and 16 feet in width. The building, which has no windows, is lighted from above.

MADEMOISELLE DE MAUPIN, mō-păn', a novel written by the French author, Théophile Gautier, when he was only 24 years of age (1835). It expresses the most salient features of romanticism. In the somewhat long preface is found the key to the interpretation of this highly imaginative work. Gautier cries out against the shammed respectability of that period and condemns the prudish stand of literary critics who according to him are merely hypocrites actuated by envy. Violently opposed to classical traditions and ideas, Gautier, who had been trained as a painter, keeps in this work the painter's vision, and emphasizes primarily form and color, while defending art for art's sake. Digressions on the supreme value of beauty are found frequently throughout the pages, and the vivid imagination of the author is fruitful to the point of exaggeration. The heroine, brought up according to tradition, rebels against it, and, disguised as a man, like the Amazons of old, resolves to study life at first hand. After many unusual adventures she becomes for one day the long-sought ideal of a romantic poet who had searched in vain until then for the "woman" of his dreams and who found her only to lose her immediately. As a novel the work is crude both in subject matter and in development, showing that it comes from a young man whose passions were not yet calm. It is, however, essentially artistic; the style is full of color and abounds in beautiful descriptions and lyric passages. While the novel did succeed in amazing placid citizens and is still classed as dangerous reading, it must not be considered as a study of any type of French character, but as a flight of imagination, a descriptive fantasy artistically worked out by a talented writer of the Romantic school.

Louis A. Loiseaux.

MADERA, mȧ-dâr'ȧ, city, California, Madera County seat, is located 22 miles northwest of Fresno, on the Santa Fe, and Southern Pacific railroads. It is in a lumber and vineyard area. Pop. (1950) 10,497.

MADERO, Francisco Indalecio, mȧ-thā'rō, president of Mexico: b. San Pedro, Coahuila, Oct. 4, 1873; d. Mexico City, Feb. 22, 1913. He came of a wealthy family and was a grandson of a former governor of Coahuila. He was educated at a Jesuit college in Mexico and at the University of California and spent the years

1889–1895 in France. He returned to Mexico, engaged in cotton planting and in banking and materially increased his fortune. He took up his residence in Mexico City in 1900 and became keenly interested in political reform. Of a naturally retiring disposition, he displayed an initiative that surprised his most intimate friends, and by 1905 he was the unquestioned leader of the reform element. He actively opposed the rule of Porfiro Díaz, and in 1908 he published his *La Sucesión Presidencial en 1910*, a strikingly well-balanced attack on the evils existing in the political and social life of Mexico. He advocated suffrage reforms, a single term for the presidency and opposed the absolutism which characterized the rule of Díaz, while crediting him with the many achievements of his administration. The book caused a sensation and was promptly suppressed by the government. However, Madero was nominated for the presidency in 1910, running against Díaz on a platform advocating a single term for the presidency. He was arrested on a fabricated charge in July 1910 and imprisoned until it was too late for him to interfere with the re-election of Díaz. Madero then headed a plot for a revolution against the government, advocating reforms in suffrage, land distribution, freedom of the press and the single presidential term among other measures. The uprising began at Puebla, Nov. 20, 1910, spread through Sonora and Sinaloa, and upon capturing Juárez, Madero set up his government and appointed a cabinet, May 11, 1911. The Díaz government then entered into a conference with the revolutionists and peace was declared May 21. Madero was elected president October 1. Temperamentally a dreamer and idealist, Madero found himself checked upon every hand in his attempts to carry his projected reforms into effect. He was unable to manage the politicians of the old régime, or the insurgent element, and in 1912 revolts broke out under Emiliano Zapata in the south and under Félix Díaz, nephew of ex-President Díaz, in the north. He was charged with being slow and irresolute in his administration of public affairs, of favoring his relatives and of personal peculation from the public treasury. The Díaz revolution was suppressed and General Díaz was imprisoned. Madero, however, was of a forbearing disposition and suspended the death sentence pronounced against the revolutionist. An uprising among the soldiers in Mexico City took place Feb. 9, 1913 and released Díaz and another enemy of Madero, General Bernardo Reyes. The federal troops for a time resisted the revolutionists but on February 17 a force of 1,200 arrived in the city and joined General Victoriano Huerta, Madero's commander in chief, in overthrowing the government. Madero was arrested and imprisoned February 19 and plans for his exile were under way when it was decided to bring him to trial. Together with the vice president, Pino Suárez, Madero was being conducted from the National Palace to the penitentiary when both were shot. No reports except those of the government were available and the official version was that an intervention in behalf of the prisoners was made by Madero sympathizers, whereupon the prisoners attempted to escape and were shot. Huerta was generally held responsible for their deaths and was eventually forced from office, although he denied complicity in the affair.

MADHAVA, or **MADHAVACHARYA,** mä'dȧ-vä-chär'yȧ, Hindu scholar and royal counselor: flourished about 1380 A.D. A writer on religious and philosophical subjects, he collaborated with his brother, Sāyana, on commentaries on the Vedas.

MADHYA PRADESH. See CENTRAL PROVINCES AND BERAR.

MADIA OIL, oil expressed without heat from the seeds of *Madia sativa.* It is transparent, yellow, odorless and may be used on the table as a substitute for olive oil or for oil-cake for cattle.

MADISON, James, American Protestant Episcopal bishop: b. Rockingham County, Va., Aug. 27, 1749; d. March 6, 1812. He was graduated from William and Mary College in 1772, studied law and was admitted to the bar, but soon after abandoned law for divinity. In 1773 he was chosen professor of mathematics in William and Mary College, and in 1775 went to England and was admitted to orders by the bishop of London. In 1777 he was elected president of the college, and during the American Revolution succeeded in keeping the college in active operation. Having been chosen as bishop of Virginia he was consecrated by the archbishop of Canterbury, in Lambeth Chapel, Sept. 19, 1790. He continued to discharge the duties of president of the college and professor of natural and moral philosophy, international law, etc., with those of the episcopate, until his death.

MADISON, James, fourth president of the United States: b. Port Conway, Va., March 5/16, 1751; d. Montpelier, Va., June 28, 1836. Madison was the eldest son of James Madison, a Virginia planter, and of Nelly Conway, daughter of Francis Conway, of King George County, Va. His father, a man of independent means, lived on an estate now known as Montpelier in Orange County. James was born at Francis Conway's home on the Rappahannock while his mother was on a visit to her parents. His educational advantages were excellent for the times; he attended the school of a Scotsman, Donald Robertson, was well prepared for college by the clergyman of the parish, the Rev. Thomas Martin, and entered Princeton in 1769. His application to his studies was excessive, and was in part the cause of later ill health; he succeeded, however, in taking the studies of the last two years in one year and took his B.A. degree in 1771. He remained at Princeton for another year doing special work in Hebrew under Dr. Witherspoon, the president. After his return home he tutored his younger brothers and began a systematic course of reading in theology, philosophy and law. At this time his study of Hebrew and theology seem to indicate a desire to enter the ministry, but he soon abandoned this and prepared himself for the legal profession and for public service. His theological studies bore good fruit later as is evidenced by the stand he took for religious liberty.

Madison was by instinct a politician and not a soldier; he took no active part in the Revolutionary War, but as early as 1774 he was appointed a member of the Committee of Public Safety for Orange County, and in 1776 was elected delegate to the convention which framed the constitution of Virginia. From that time

until he retired from the Presidency he was honored with high public offices by his State and by the nation. In the Virginia Convention Madison succeeded in substituting for a clause in the Bill of Rights permitting the "fullest toleration" in religion, a clause allowing the "free exercise of religion." This was a distinct blow to religious intolerance for, as he said, toleration implies jurisdiction, and the State should have no coercive power over religious thought. He was a member of the first Virginia assembly but failed of re-election because, as his biographer Rives tells us, he refused to conform to the universal custom of his day and "treat" his constituents; he was, however, made a member of the governor's council and so distinguished himself that in 1780 while still under 30 he was chosen as delegate to the Continental Congress. In this Congress he was conspicuous for his opposition to the issuance of paper money by the States; for his efforts to secure for Congress the right of taxing imports, and for his determined stand to retain for the States the right of navigation on the Mississippi. Madison saw clearly that a government so organically weak that it could not enforce its requisitions and could pay its debts only by increasing its debt could never be effective; hence he labored unceasingly to enlarge the power of the central government. The office of delegate was limited to one term, so Madison was not returned to Congress in 1784, but the high esteem in which he was held was shown by his immediate election to the State assembly. Virginia was a very influential State and her attitude toward national questions was of great importance. In the assembly Madison tried to indoctrinate the people of Virginia with his ideas concerning the Federal power. His bill to regulate trade in Virginia and to provide ports of entry led first to the conference between Virginia and Maryland with reference to trade on the Potomac and later to the Annapolis Convention which met in 1786 to consider the trade and commerce of the United States. This Convention at Annapolis urged upon the States the appointment of commissioners to meet in convention at Philadelphia "to devise such further government as shall appear to them necessary to render the Constitution of the Federal Government adequate to the exigencies of the Union." The summoning of the Philadelphia Convention was largely due to the wise bills introduced by Madison in the Virginia assembly and to his direction of public sentiment, and it was eminently fitting that he should be one of the delegates of the Virginia Commission at whose head was George Washington. Madison's views on government are clearly defined in his "outline system" which formed the basis of the Virginia plan proposed to the Convention. His system demanded that there should be a due supremacy of national authority without the exclusion of local authority, that the national authority should extend to the judiciary and to the militia; that the national legislature should be composed of two bodies, the larger elected for a short, the smaller for a longer term; that Congress should have certain coercive powers; that a national executive should be provided and that the basis of representation in Congress should be changed from States to population. The "Virginia plan" was the germ of the Constitution and Madison is rightly called the "Father of the Constitution." His arguments in favor of the proposed government were exhaustive and convincing, and his private notes of the work of the Convention and of his debates purchased from his widow and published by Congress form a valuable addition to our knowledge of this stormy period. While the Constitution was before the people for consideration Madison, Hamilton and Jay wrote a series of papers called in collected form *The Federalist,* in which they discussed government in general, defined the character of the proposed union, met objections and proved the advantages to be derived from effective central government. Madison was a member of the Virginia Convention which met to consider the ratification of the Constitution and by his keen analysis and clear-cut argument contributed more than any other man to secure its adoption. His chief opponent was Patrick Henry; his ablest ally, John Marshall. Owing to Henry's antagonism, Madison was defeated as candidate for the Senate, but was elected as representative to Congress and took his seat in April 1789. During this session of Congress, Hamilton and Madison, who had hitherto been as one in their efforts to centralize power, drifted apart, and Madison gradually began to endorse Jefferson's position as to certain inalienable States' rights. There is no reason to accuse him of bad faith; his statesmanship was never overbold, and Hamilton's commercial system, his extensive financial schemes, especially the funding of the national debt and the assumption of State debts by the general government, gave so much power to Congress that Madison withdrew his support from the Secretary of the Treasury and vigorously opposed his measures. Although Madison had now definitely cast in his fortunes with the Republican opposition his moderation and good sense enabled him to retain the friendship of most of his political opponents.

From 1793 to 1796 the country was greatly agitated over the relation of the United States toward France, and on the outbreak of war between France and England the President issued a neutrality proclamation to the great disgust of the French, who had expected active friendship from the United States. Although both countries interfered shamefully with American commerce, popular sentiment and the Republican party sided with France. In 1794 Madison, supported by Jefferson, introduced a bill demanding retaliatory measures against Great Britain, and a temporary embargo was laid on British commerce. The signing of the Jay treaty by the President was a signal for an outburst of popular indignation, and Madison, as leader of the opposition in Congress, opposed the appropriation of money to carry out the terms of the treaty. In 1797 Madison retired and enjoyed for a short while the pleasures of private life. A year later he was aroused to activity by the passage of the unpopular Alien and Sedition Acts. The Virginia resolutions written by Madison denounced these laws and declared that in case of a dangerous exercise by the Federal government of powers not granted by the compact the States had the right to interfere. These resolutions still further emphasized the position of the Republican party and pledged it to the support of States' rights. The year 1801 brought an overwhelming defeat to the Federalists; Jefferson was inaugurated President and

Madison became secretary of state. He was thoroughly in sympathy with the president's views and shared the popularity of that brilliant administration. The last years of Jefferson's second term were clouded by the insulting actions of England and France with reference to the American Navy. The orders of the British and the decrees of Napoleon concerning the seizure of neutral vessels were ruining American commerce. Vessels were seized by the English and by the French, American seamen were impressed and ports blockaded. Jefferson was opposed to war and in his efforts to coerce France and England by commercial restrictions he induced Congress to lay an embargo on British trade. Instead of injuring England this seriously crippled American commerce and was soon repealed. In this troubled condition of affairs Madison became president in 1809. Like Jefferson he was opposed to war and tried diplomacy. He attempted to have the British Orders in Council withdrawn. The British envoy agreed, but the British government repudiated his action. Subsequent negotiations with another British minister, James Jackson, were also fruitless. Continued insults were heaped upon American ships and men; the country demanded definite action against the aggressors; even the peace-loving president, weary of the offensive attitude of England, at last gave his consent to war. On June 18, 1812, war was declared and continued with varying success until the Peace of Ghent in 1814. After nearly three years of fighting, after ruinous loss of money and property, the country was practically just where it stood in 1812, "its boundary unchanged, its international rights still undefined, the people still divided." Madison lacked vigor as a war president, nor had he sufficient determination to secure advantageous terms of peace. He was far greater as a framer of the Constitution than as an executive.

In 1817 Madison retired from office and settled on his estates of Montpelier. He had married in 1796 Mrs. Todd, afterward the celebrated Dolly Madison, and with her he enjoyed 20 peaceful years in his country home. He was interested in farming, he thought and wrote much on all topics of public interest. He discussed social and moral questions, slavery and education. "Education," he maintained, "was the true foundation of civil liberty." The last public appearance of the venerable statesman was in the Virginia Convention of 1829 which met to amend the state constitution. In character Madison was thoughtful, reserved and cautious; in a time of hard drinkers he was notably abstemious. Moderation characterized all his habits. Dignified and kindly and an excellent conversationalist among those he knew well, he made and retained warm friends. His knowledge was profound and accurate, and he was considered an authority on all constitutional matters. His literary style was labored, but his arguments were keen, comprehensive and convincing.

EMILIE MCVEA,
Late President, Sweet Briar College.

Consult Rives, W. C., *History of the Life and Times of James Madison*, 3 vols. (1859–1868); Gay, S. J., 1938); Brant, I., *James Madison* (New York 1941–1950); Koch, A., *Jefferson and Madison* (New York 1950).

MADISON, town, Connecticut, in New Haven County, 20 miles northeast of New Haven, at an altitude of from sea level to 367 feet at its highest point. Madison is served by the New York, New Haven and Hartford Railroad. The town is a summer resort, but has some agriculture. Formerly called East Guilford, it was settled in 1649, and in 1826 it was incorporated as the town of Madison. Pop. (1950) 3,044.

MADISON, city, Illinois, in Madison County; altitude 425 feet; on the Mississippi River; opposite St. Louis, Mo.; on Illinois Central and other railroads (freight). Madison, Granite City, and Venice, known as the Tri-Cities, are steel-mill cities. Merchants Bridge at Madison was built in 1890. Pop. (1940) 7,782; (1950) 7,960.

MADISON, city, Indiana, Jefferson County seat; altitude 460 feet; on the navigable Ohio River; 86 miles southeast of Indianapolis; served by the Pennsylvania Railroad (freight only); and three airports. Situated in a region of dairy and poultry farms, it has food processing and packing plants. Tacks and rivets, laundry baskets and hampers, work clothes, porch furniture, saddle trees, and women's shoes are manufactured. From Madison were built the first two turnpike roads, and the first steam railway west of the Allegheny Mountains. Pop. (1940) 6,923; (1950) 7,485.

MADISON, village, Maine, in Somerset County; altitude 290 feet; on the Kennebec River; 35 miles north of Augusta; on the Maine Central Railroad. There is abundant water power and manufactures include plastic textiles, lumber, and paper. Historic Old Point and Norridgewock are nearby. There were some settlers here before the revolution, and the village was incorporated in 1804. Pop. (1930) 3,036; (1940) 2,581; (1950) 3,630.

MADISON, borough, New Jersey, in Morris County; altitude 250 feet; 18 miles west of Newark; on the Delaware, Lackawanna and Western Railroad. It is a suburban residential borough; its only industrial establishments are the greenhouses which give the borough the popular name of Rose City. Madison is the seat of Drew University, and two miles away, at Convent Station, is the College of St. Elizabeth, a Roman Catholic college for women. The Morris and Essex Kennel Club holds an annual dog show at Madison. The borough was incorporated in 1889; its government is administered by mayor and council. Pop. (1940) 7,944; (1950) 10,412.

MADISON, city, South Dakota, Lake County seat; altitude 1,669 feet; 43 miles northwest of Sioux Falls; on the Chicago, Milwaukee, St. Paul and Pacific Railroad. It is in an agricultural area raising livestock and grain, and has flour mills, grain elevators, hatchery, creameries, and packing plants. Eastern State Normal School (coeducational) is here. Lake Madison, two miles away, is a resort. Madison was settled in 1875 and named for the Wisconsin city. Pop. (1940) 5,018; (1950) 5,142.

MADISON, city, Wisconsin, state capital and seat of Dane County, is situated about 80 miles

west of Milwaukee in an agricultural region in the south central part of the state. The city fills and overflows a gently curving isthmus, less than a half mile wide at its narrowest part, between Lake Mendota on the north and Lake Monona on the south. These waters, connected by the Yahara River, form part of a chain known as the Four Lakes, the other two being Lake Waubesa and Lake Kegonsa to the south. In the southwest part of Madison itself is also Lake Wingra. All five lakes can be seen from the dome of the state capitol. The city's altitude varies from about 850 to 955 feet above sea level. The city is served by three railroads—the Chicago, Milwaukee, St. Paul, and Pacific, the Chicago and North Western, and the Illinois Central. A network of federal and state highways provides for motorbus and truck transportation in all directions. The city has its own airport, with commercial airline service; and there is a seaplane base on each of its isthmus lakes.

Economic Life.—Madison is the second most populous city in the state, being exceeded only by Milwaukee. Government service—municipal, county, state, and federal—provides employment for thousands of Madison's residents. Among its educational institutions, the University of Wisconsin (see WISCONSIN, UNIVERSITY OF) alone employs more than 1,500 people on its administrative, teaching, and research staffs. Many of Madison's residents also work in the offices and stores of the wholesale and retail trades, in the railroad shops, or in the city's factories. Madison's most important manufactures are dry cell batteries, turret lathes and other machine tools, balancing machines, die castings, farm machinery, chemical plant foods, paper boxes, bottle caps, hospital equipment, and dairy and other food products.

Educational and Cultural Institutions.—In addition to the state university and public and parochial schools, the educational institutions in the city include Edgewood College (Catholic, for women), music and art schools; and the United States Armed Forces Institute, the largest correspondence school in the world, with an enrollment of more than 100,000 students in 1951. Among Madison's library facilities are the Free (public) Library, the Wisconsin Legislative Reference Library (in the capitol); the extensive libraries of the university, the State Historical Society, and the Wisconsin Academy of Sciences, Arts, and Letters (all located on the university campus); and the important collection of the Forest Products Laboratory, a research institution maintained by the U.S. Forest Service in cooperation with the university. For many years, the city has been a recognized research center, and more recently it has also become a medical center. In 1951, it had seven Class-A hospitals, and $20,000,000 worth of new hospital and medical facilities were under construction.

Buildings.—Madison, with its extensive lake frontage, its many parks, and its fine public and private buildings, is one of the most attractive state capitals in the Union. One of its most imposing buildings is the State Capitol, which occupies a commanding site near the heart of the city on grounds covering 14 acres. Designed in Italian Renaissance style and constructed between 1906 and 1917, its exterior, including even the dome, is of white granite. Within the building are works of art by such noted American painters and sculptors as Albert Herter, Charles Y. Turner, Edwin H. Blashfield, Kenyon Cox, Karl Bitter, and Daniel C. French. A 9-foot marble figure, *The Genius of Wisconsin* by Helen Farnsworth Mears, executed when that famous Wisconsin sculptor was 14 years of age, stands in the capitol's rotunda. The State Historical Society Museum, which contains important collections of Indian, pioneer, and folk and fine arts, owns *The Spirit of Carnival* by Vinnie Ream Hoxie, the renowned sculptor who was born in Madison.

Two of the city's churches are about a century old. St. Raphael's (Catholic) was built in 1854, the year that the first railroad train reached Madison and the first "class" (two men) was graduated from the university. Grace Episcopal Church is younger by a few years (1858), though its parish dates from 1839 and was the first religious organization in Madison. Wisconsin's first synagogue, also erected in Madison in 1858, still stands. The city has always been hospitable to people of all faiths. Among Madison's many beautiful or interesting buildings planned as private dwellings is the mansion, built in 1854, purchased by the state legislature in 1885 as a residence for Wisconsin's governors in office, and now the university's graduate student center. For a number of years it was the home of Senator J. G. Thorp, whose daughter-in-law was Anna Longfellow. It is said that it was she who persuaded her famous father, Henry W. Longfellow, to write his poem, *The Four Lakes of Madison.* Another dwelling is the Braley Home, occupied during the 1880's by Judge Arthur B. Braley, Shakespearean scholar and father of Berton Braley, author and newspaper correspondent. In this home, as a young woman, Ella Wheeler Wilcox wrote one of her most famous poems, *Solitude,* better known as *Laugh and the World Laughs with You.* Near Lake Monona is the B. O. Webster Home, once the residence of Robert M. La Follette, U.S. Senator from Wisconsin and thrice Wisconsin's governor. Madison's yellow sandstone has been used for many public, as well as private, dwellings. City Hall, built in 1858 in an adaptation of the Florentine Renaissance, is constructed of this material. From this building, the city government is administered by 20 councilmen, elected at large, and a mayor.

History.—Almost as soon as the Territory of Wisconsin was organized in 1836, its legislators chose a site in the wilderness for its capital, named it Madison (after the fourth president of the United States who had died a few months before), and made Madison the seat of Dane County. In 1837, the townsite was laid out, the first white family settled there, and workmen arrived to begin construction of the capitol. Before the end of 1838, Madison had crude inns, a general store, a school, a weekly newspaper, a road, and the beginnings of stagecoach service. The first session of the legislature had also been held, but the legislators suffered so much from poor accommodations during their stay that Madison almost lost its position as capital that year. In 1846, with a population of about 625, Madison was incorporated as a village. Ten years later, as a thriving community of several thousand residents (6,611 by 1860) it was incorporated as a city. By that time, Wisconsin had outgrown its first statehouse, and the erection of a new one was begun in 1857, which served for the next half century. The national depression of 1857 was soon reflected in the city's economy; and with the

outbreak of the Civil War, the University of Wisconsin, young, weak, and unpopular at that time, lost almost all its students to the army. From its beginning, pressures for the removal of the capital had plagued Madison's residents, but, following the war, objection waned, and the city entered its long period of civic, cultural, and economic development which was scarcely affected by the later periods of economic depression. In this development the university played no small part for, after its reorganization in 1866 and the assurance of regular appropriations for its support, its fame spread far beyond state boundaries.

The following figures indicate the city's population growth: (1900) 19,164; (1930) 57,899; (1950) 95,594.

The regular population, a large part of which is of German or Scandinavian extraction, is augmented by university students (more than 19,000 in 1950 which are included in the census figures for that year), and by visitors who, like its residents, enjoy the water sports on its lakes.

MADISON, river, in Montana, which has its rise in the Rocky Mountains, at an elevation of 8,300 feet. It flows north through Madison County and unites with Jefferson and Gallatin rivers to form the Missouri River; its whole course is about 180 miles.

MADISONVILLE, city, Kentucky, and Hopkins County seat, altitude 460 feet, on the Louisville and Nashville and the Illinois Central railroads, 125 miles southwest of Louisville; also on state and federal highways. Coal mining, tobacco growing, and dairying are the county's principal activities. The government is mayor-council. The city was named in honor of President James Madison. Pop. (1940) 8,209; (1950) 11,136.

MADLER, mâd'lĕr, **Johann Heinrich von,** German astronomer: b. Berlin, May 29, 1794; d. Hannover, March 14, 1874. He was educated at the University of Berlin. He became a professor and one of the governing faculty at the Berlin Normal School. From 1840–1865 he was professor and director of the observatory at Dorpat (Tartu). He made observations with an accuracy never before attained and he now devoted himself principally to the fixed stars. He published in 1834–1836 a map of the moon in four sheets which surpassed anything then published.

MADOG AB OWAIN GWYNEDD, mȧ' dŏg ȧb ō'wān, or **MADOC,** legendary Welsh prince: b. 1150; d. ?1180. He is said to have gone to sea with 10 ships, and 300 men, in 1170, and discovered America. He made a second voyage to and from this unknown land, but finally was lost to the knowledge of his countrymen. Richard Hakluyt gives an account of the voyages in his collection. In Sir Richard Owen's *British Remains* the legend is referred to. He was the subject of Robert Southey's epic poem, *Madoc* (1805). George Stephens, in *Madoc, an Essay on the Discovery of America in the 12th Century* (1893), asserts that the story of Madoc is a baseless fable.

MADONNA IN ART, The. In the early days of Christianity the teaching of the church was largely carried on by the medium of pictures; statuary was added later. The translation of the Bible was in Latin and examples of the book were produced in parchment manuscripts emanating from the monastery scriptoria. They were very few and therefore costly. Hence it is not surprising that the clergy utilized the graphic abilities of their more talented members and other available artistic sources to portray Biblical scenes in mosaics and wall paintings to impress on the minds of the populace (practically all illiterates) the teachings of their creed. The subjects to be treated were largely selected by the patrons (the clergy), and those subjects naturally were the ones most likely to appeal to the masses. The relation of Mother and Child viewed from the aspect of divine inspiration could not but be foremost of the subjects selected as most certain to gain popular attention and to reach the innermost sentiments of humanity. And, from the limner's standpoint, no theme could better enthuse and inspire genius to perfection of execution and the bringing forth of ecstatic pictorial expression. A natural sequence of these accumulated impulses was the prolific production and reproduction of the Madonna in as many aspects and forms as the differences in genius itself. Hence the innumerable examples of the lovely theme which have present existence. No single subject has been treated so prolifically and from so many viewpoints as this of the divine Madonna. The earliest depiction of the Madonna is a subject of controversy. Legend tells us St. Luke the Evangelist painted pictures of the Holy Virgin, and there are several extant drawings which are claimed to be from his pencil. The Virgin as *orante,* usually termed the "Intercessor," with arms outstretched in Oriental form of supplication, is most generally accepted as the first method of treatment as found in mosaics and on glasses of the 4th or early 5th century, some with the name "Maria" inscribed. An early Assyrian manuscript of the 7th century in the chapel of Venantius has such an *orante* depiction. On ancient Christian sarcophagi the representation of the Holy Virgin is very rare, but in the mosaics of Santa Maria Maggiore (Rome, mid-5th century) we have the *Virgin and Child* in medallions on the triumphal arch, and on the spandrils of the arch are the *Annunciation, Presentation in the Temple, Adoration of the Magi, Journey of Christ with Mary and Joseph to Jerusalem.* Of about the same date is a painting seen in St. Agnes catacomb, in which the Holy Virgin seated stretches forth her hands in prayer. By 736 the Iconoclasts created must destruction of all kinds of Biblical depiction from Byzantine artists, but by 787 comes the revival and the Virgin again appears as *orante,* veiled and aged. With the advance or development of the Madonna theme Giovanni Cimabue (13th century) produced the "enthroned" Madonna. And with the arrival of these talented masters the Byzantine stiffness and prescribed rigid rulings of the Greek Church forbidding natural depiction disappears and the human form and garb take on the suppleness of flesh and clothing. It is the beginning of free and highly developed art, and as such is usually the phase chosen as the first classification with which to deal with detailed descriptions of the theme of the Madonna in art.

The Madonna Enthroned.—In its early conception the subject depicts the "Queen of Heaven" (*Regina Coeli*), seated in the sky, surrounded by the saints and angels. An early example of this is the Virgin in Campo Santo, Pisa. As queen of Heaven, having homage

paid her, she is crowned first then veiled. In this conception of the subject the throne is supposed to be a heavenly throne and symbolic of dignity and divinity. Mary is usually garbed in a red tunic as symbol of love and with a blue mantle signifying Heaven. The Child is vested in a tunic till the 15th century, but then generally appears undraped. The Babe generally holds up a hand in blessing, but in the 6th century mosaic of the enthroned Madonna in the Basilica of San Apollinare Nuovo, Ravenna, Mary raises her hand in blessing. The first human figures we see around the throne are the saints, especially John Baptist, the Apostles and the patrons of the particular church to which the work of art is dedicated. Saint John is represented as a child generally bearing a reed cross; at times, as messenger, he has wings. Later patriarchs, prophets, sibyls are in attendance about the throne. Well-known examples are very many and but few can be mentioned. That of Fra Bartolommeo (Baccio della Porta, 1469–1570) is in the Pitti Gallery, Florence; Andrea del Sarto's Madonna di San Francesco in the Uffizi Gallery there stands on a pedestal throne with harpies at its corners (hence sometimes termed "Madonna of the Harpies"). Luini's Madonna in the Brera, Milan, is seated on a coping. Perugino's Madonna (Vatican, Rome) is one of this master's best works and depicts the Virgin seated on a carved and inlaid architectural marble throne. Pinturiccio's Madonna in the chapel of Saint Andrea, Perugia, has the child Saint John standing at the throne's foot. Raphael's Ansidei Madonna (London National Gallery) is reading a book while Saint Nicholas and Saint John Baptist are in attendance at the two sides. The English government paid £72,000 in 1885 for this wonderful painting. Other enthroned Madonnas of Raphael are the Madonna of Saint Anthony (owned privately) and the Baldacchino Madonna (Pitti Gallery, Florence). Among the early exponents of the enthroned depiction were Vivarini, Bellini and Cima; Girolamo dai Libri's altar-piece in San Giorgio Maggiore, Verona, is noteworthy, and Venice is perhaps richest in Madonna creations. Later masters to paint this subject were Titian, Tintoretto and Veronese. Of the early type Cima's picture in the Venice Academy takes about first position; the Madonna is seated on a marble throne having a pillared portico. Palma's beautiful altar-piece in Vicenza is noteworthy among enthroned Madonnas. Bellini excelled in this style and the examples deserve their renown. Ruskin calls his painting in the Venice Academy "One of the greatest pictures ever painted in Christendom in her central art power." The Virgin is accompanied by three saints on each side and three choristers below. His Frari Madonna (Venice) has three compartments, the Virgin occupying the central one. His San Zaccaria Madonna, in spite of its fine execution and beauty of conception and grouping, was created when the artist was over 80 years old. Next we come (late in the 15th century) to Giorgione (who lived only 34 years) who has two Madonnas, one in the Madrid Gallery, the other in Castel Franco. In the latter the throne is exceptionally high, the upper step being above the heads of the accompanying Saints Liberale and Francis. This shows great depth and refinement of feeling in the drooping head and dreaming eyes. While the queenly aspect of these Italian pictures is never displayed with a crown as is frequent on the mosaics dating from the 8th to the 11th century, except in the pictures by Giovanni da Murano and Carlo Crivelli (Venetian school), the Holy Virgin in German art is frequently crowned when enthroned, as in Holbein's Madonna at Darmstadt, that by Van Eyck at Frankfort and that by Memling at Bruges, and Schongauer's at Munich. In the enthroned Madonna of Quintin Matsys in the Berlin Gallery the Virgin is kissing the Child and the northern tendency is vividly displayed in the accessory of the stand containing food. Of modern artists whose enthroned Madonna creations are worthy of mention should be cited Bouguereau, Ittenbach, etc.

The Annunciation.— The angel's announcement to the Spiritual Bride is a subject as prolifically depicted in Christian art as any other. It was a theme displayed everywhere, in every village, street, church or dwelling, in painting or carving. Early we find it in the mosaics, as on the arch of the Santa Maria Maggiore. The attitudes of the Virgin differ in periods or in accordance with the individual conception of the artists. In some the angel stands before the young virgin who kneels in pious submission, or the angel kneels in some; or again, as in Giotto's work, in Padua, both kneel. Later artists picture Our Lady in the Annunciation often as a crowned queen, bejeweled, but in modern work the Virgin and surroundings are treated with simplicity and mystic symbolism is given to the subject. While it is usual that but one announcing angel appears on the scene, Andrea del Sarto, Tintoretto, Francia and Fra Bartolommeo give an angelic choir. Usually the Holy Dove is seen flying toward Mary from the Father. Pisanello's Annunciation in Verona pictures the most beautiful innocence in girlish beauty. Beautiful purity is expressed in the works of Fra Angelico; that in the Oratorio del Gesù, at Cortona, accompanied by the colonnade and scene of Eve's expulsion as accessories, is extremely impressive. In the Uffizi Gallery is a Boticelli Annunciation depicting the angel paying the deepest obeisance at Mary's feet while the Holy Maid stretches out her hands in surprised humility. Other well-known Annunciations are by Simone Martin in the Uffizi, Fra Filippo Lippi, Carlo Crivelli (National Gallery, London), where the scene is produced in a surrounding of magnificent architectural decoration, while Perugino (in Montefalco picture) shows utter simplicity. Paolo Veronese depicts fear as the Virgin shrinks back at the message. Northern creations reveal their source by bringing in such accessories as a spinning wheel, couches, etc. Jan van Eyck places the Holy Virgin by an altar in an alcove with an open book to rest her arm on, her face averted toward the heavenly messenger, who is in a cope and carries a sceptre. Albert Dürer's series of the life of the Virgin depicts in the Annunciation Mary as a German Hausfrau, surrounded by many architectural accessories. In the National Gallery, London, we find Rosetti's work affording very simple treatment in modern depiction, and Burne-Jones gives the scene in a finely constructed painting.

The Nativity.— In the works of the masters

on this subject we find Mary beside her Son's cradle in the act of adoration. Even the early pictures show angels attendant but the veil found in earlier depiction is discarded later. The scene is cast in a cave or cleft in a rock generally transformed into a stable, but there are variations to suit the conceptions of the different masters. In Santa Maria, Trastevere, is a mosaic displaying Mary reposing on a couch in the cleft of a rock. Giotto's school makes the scene a stable of wooden construction; some place the theme in the open with perhaps a ruin or fragment of some structure as accessory. The *swaddled* Babe of the Italian school is, of course, the *bambino* of that country. Orcagna (church of Assisi) places Mary sitting beside the cradle arranging the covering, while Giotto has the Child before her while she is seated on the ground. Perugino's Nativities (in Perugia and Rome) display Mary and Joseph kneeling in adoration of the Babe with angels present. Well known is the Nativity in the London National Gallery by Piero della Francesca (unfinished) in which the Child is lying on the ground with the mother kneeling beside while angels are playing on lutes and singing. That depiction by Luca Signorelli in the same place also shows the Infant on the ground, Mary kneeling beside Him. In the same gallery we have Botticelli's depiction of the scene enacted in a shed, and Carlo Crivelli uses the same surroundings. In Luini's picture an angel holds the Child while Mary kneels with folded arms, her face one of the most beautiful of any of the Madonnas. In most of the above and in others shepherds are portrayed in more or less proximity. In some cases the painting is properly called "Adoration of the Shepherds" on account of their close presence to the Virgin and Child, but later works generally place them in the background. The illumination of the scene frequently (with Rembrandt, Correggio, etc.) emanates from the glowing rays passing from the Holy Babe.

Adoration of the Magi.— This was a favorite subject with the Catacomb dwellers and we find over 20 depictions of the scene in these subterranean galleries. Mary is seated on a throne and the Magi in their tunics and Phrygian caps bring gifts of dishes and baskets. Their number runs from three to six. The early method of treatment makes the Babe rest in the mother's arms, but in the Santa Maria Maggiore (Rome) mosaic the Child is seated on a pedestal with hand upraised in benediction. Usually we find Him in His mother's lap. The emanating glory of the Babe frequently is the source of light and the benediction act is frequently His pose. An Adoration of the Magi mosaic (about 6th century) is in the chapel of San Apollinare Nuovo at Ravenna, in which the Magi lead a procession of female martyrs bringing their crowns as votive offerings to the Madonna. Giotto's painting in Padua places the scene in a stable while Fra Angelico (National Gallery, London) chooses the entrance of a cave as the scene of the King's devotions. In Filippo Lippi's 'Adoration of the Kings' in the Uffizi, Florence, Mary is located in a wide landscape in which figure a host of persons surrounding her. Other noted Adorations are by Baldassare Peruzzi (London National Gallery), Pinturicchio, Mehling (Bruges), Rogier van Weyden (Munich), Rembrandt; Rubens painted 15, of which one is in Madrid, another in the possession of the Duke of Westminster.

Flight into Egypt.— In pictures brought under this title Mary is sometimes seen seated on an ass with Joseph walking beside; the ox which tradition says accompanied them rarely appears in the paintings. Sometimes an angel leads the ass. Well-known depictions of this scene are by Giotto (Padua), Fra Angelico (Florence), Pinturicchio, Memling (Munich).

Riposo.— This phase of the Madonna series is more popular with artists of the past than the 'Flight.' It depicts the Holy Family after the tedious journey through the desert resting in a fertile country surrounded by fruit trees, Mary bathing the Child, etc. It was greatly favored by German and Flemish masters (Albrecht Altdorfer's in Berlin, Lucas Cranach, Martin Schongauer's in Vienna, etc.).

Pastoral Madonnas.— From the 15th century a new style of treatment of the Madonna theme arrives. It is the placing of the Virgin in a landscape surrounding. There are but few, such as Raphael's earliest Madonnas. Three most noted are La Belle Jardinière (Beautiful Gardener) in the Louvre; Madonna in the Meadow (Madonna in Grünen) in Belvedere Gallery, Vienna; and the Cardellino Madonna (Madonna of the Goldfinch) in the Uffizi, Florence. All three among the most prized paintings in the world and too popularly multiplied to need description. Raphael's later work, the Casa Alba Madonna, is less well known with its turbaned Roman patrician depiction of the Virgin. Leonardo da Vinci's Madonna of the Rocks gives the Holy Virgin, in the foreground of a grotto, grouped with the Child and the infant John. Luini painted a pastoral Madonna (in the Brera, Milan), but very noted is Correggio's 'La Zingarella' (Gipsy) or 'Madonna del Corniglio' (Naples) which is posed in a lovely landscape as is also his kneeling Madonna in the Uffizi, both of which always call forth admiration. Palma Vecchio's 'Santa Conversaziones' in Naples, Dresden, Munich and Vienna are public favorites. In the *pastoral* class of Madonnas must be included the three "enclosed garden" examples by Francia (Munich), Filippino Lippi (Florence) and by Schongauer, in which the Virgin and Child are surrounded by a hedge of roses with a landscape in the rear perspective.

Domestic Groups.— This method of depiction of the biblical scene was vogue among painters of the middle 15th century. They consisted of the Holy Virgin and Child associated with Saint Joseph, Saint Elisabeth and her son, and frequently other attendants. A number depict Saint John Baptist child playing with the Holy Infant; Saint Ann, mother of the Holy Virgin, appears in some; da Vinci even depicts (in a cartoon) Our Lady seated on Saint Ann's knees. Girolamo dai Libri (London National Gallery) painted such a group, and Perugino has a work in which Saint Ann rests her hand on the Virgin's shoulders while boys and women relatives are grouped about. Very popular are the groups that include the infant Saint John Baptist playing with the Child (as Raphael's in National

Gallery, London). Both Botticelli and da Vinci created pictures of Saint John adoring the Infant. In the same inspiration is Luini's 'Madonna dell' Agnello' at Lugano. Another popular group subject adopted in pictures by Titian, Perugino, Correggio, Parmigiano, Borgognone, Memling, etc., is the 'Marriage of Saint Catherine,' in which the Child is placing a ring on the finger of the saint. Good modern representations of such groups are by P. A. J. Dagnan-Bouveret in the New Pinakothek, Munich, in which the holy mother, depicted as a peasant, is seated on a bench in the carpenter's shop and the Child at her breast, under her mantle, illuminates and pierces with rays of glory the coarse textile. But, though numerous, both French and German modern paintings of the Madonna lack the devotion or even inspirational features which give such glory and beauty of conception to the early Italian masters and those of the Renaissance.

Madonnas in Domestic Surroundings.— These include the 'Holy Family' series. The worldly environment in depiction of this mystic religious subject has found few exponents, and those confined largely to northern artists. To the German and Dutch the maternal dignity of the *Hausfrau* appeals so strongly as to call from their limners' hands sacred Madonnas in everyday household surroundings. Of such we have pictures by Quintin Matsys (Munich) with its Flemish sleeping apartment, having the Virgin and Child as occupants; the 15th century German artist Schongauer (Belvedere Gallery, Vienna) gives Joseph feeding the cattle from hay in his arms looking with fondness in the doorway at the Virgin holding a bunch of grapes while the Child nestles in her lap. But in Italy, Giulio Romano in his Madonna della Catina (Dresden) portrays the Divine Babe in a basin (*catina*), ready for the bath, while the infant Saint John pours water from a ewer. The Madonna dell' Impannata (of the papered window), formerly considered as Raphael's and later ascribed to Romano, pictures Elisabeth, Mary Magdalen and the child Saint John beautifully grouped with the Virgin and Child. The picture of the French artist Mignard (Louvre) called 'La Vierge à la Grappe' is well known. Salembini's Holy Family (Pitti Palace) depicts the gambols of the Child Jesus and Saint John with puppies. Rembrandt's two 'Ménage du Menuisier' (carpenter's home), in the Louvre and Petrograd, picture a combined living and workroom with Joseph at his bench and Mother and Child as central subjects; his painting in the Munich Gallery also brings Saint Joseph as carpenter into the scene.

Mater Amabilis.— The Madonna of Love. Some consider this the most popular type of the Madonna in Art. The depiction of a mother's love is one of the most endearing themes of the artist for all humanity. Raphael's sublime depictions, of course, lead in this type with his Madonna Tempi (Munich), in which the Virgin Mother presses her lips to the Child's cheek. His Conestabile (Petrograd) and Ansedei Madonnas and Babe peering in companionship into the Book of Wisdom belong here, also the Holy Family of Francis I, in which she stoops to lift the Child from the cradle and the Madonna della Sedia (chair Madonna) in the Pitti Gallery, Florence, embracing the Infant. Correggio's painting in the Uffizi really belongs to this series with the Virgin stooping over the Babe, and his Madonna del Cesta (of the basket) in the London National Gallery, named after the basket (*cesta*) lying on the floor; and his Madonna del Latte (Petrograd), also his Madonna della Scala (of the Staircase) in Parma are surely of this category. Titian sometimes created such a Mother of Love as in his 'Vierge au Lapin' (Louvre) in which she is calming a rabbit for her Child to play with, also the Madonna with Saints Ulfo and Brigida (Madrid) in which the Child is accepting a gift of flowers from the latter saint, and another in the Uffizi Gallery. Of pictures portraying the Holy Mother suckling her Babe there are a number, best known perhaps being the Madonna of the Green Cushion (Louvre) by Andrea Solario. And the Mother watching the sleeping Babe is another phase of the theme treated by masters of art, such as Raphael's Madonna of the Diadem (Louvre), others by Guido Reni (Rome), Sassoferrato, Carlo Dolce, etc. And among northern artists the Mater Amabilis has been pictured by Dürer, Holbein (Meyer Madonna), Rembrandt, Rubens, van Eyck, Schongauer. Among modern artists who have created fine pictures of this theme are Gabriel Max, Bouguereau, Carl Müller, N. Barabino, Dagnan-Bouveret, Guay, Macomber, Bodenhausen.

Madonna in Gloria.— The Madonna in the Sky. These usually represent a landscape below and the Madonna in the upper sky. In the Madonna dell Stella by Fra Angelico, in San Marco, Venice, a star is located over the head posed on the veil, the figure is full length surrounded by a mandorla of golden rays. The Madonna of Saint Sebastian (Dresden) has a surrounding of cherubs and clouds with saints below. Moretto (Brescian school) treated the theme traditionally, but very lovely is his Madonna of San Giorgio Maggiore, Verona, which shows very naturalistic effects in atmosphere above and depicts Saints Cecilia, Lucia, Catherine, Agnes and Barbara beneath; another of his is in the Berlin Gallery, a mandorla encompassing Mother and Child. Three paintings on this subject are in Venice by Gianfrancesco Caroto, also one by Cavazolla (Morando); these all are of the Brescia school. Tintoretto and Titian produced creations of this theme. Raphael gave us the Foligno Madonna (Vatican), which is greatly admired, but his Sistine Madonna (Dresden) brings us to the apex of highest inspiration with its majestic full-length figure in perfect poise and the charm of the cherubs surpasses all found in other depictions. Later came the selection of the crescent moon on which artists posed the Madonna in Glory; the exponents of this style are Albrecht Dürer, Sassoferrato (Vatican), Tintoretto (Berlin). Modern painters of the theme are Bouguereau, Bodenhausen, Defregger, etc.

Pietà.— This is probably the most popular and touching conception of the Madonna in Art. Every Roman Catholic church has one. It is the representation of the Virgin displaying the complete sacrifice. Francia's beautiful conception of the theme is shown in his painting in the London National Gallery, in which the outstretched limp body of the Crucified

One lies across the lap of the Holy Virgin while an angel on either side attends. Luini portrays the Head, crowned with thorns, falling back on the Mother's brow while she supports Him. The same scene with Saint John and Mary Magdalen attending is often termed a Pietà but correctly the groups should consist of Mother and the lifeless Savior, perhaps with angel or angels attending. Giovanni Bellini's painting in the Ducal Palace, Venice, shows the Crucified One being raised from the tomb by Mary, His head resting on her face, Saint John holds up His arm; another by this master is in the Uffizi Gallery. Crivelli painted two very pathetic Pietàs, one of which is in the Vatican. In the Pitti Palace is a Pietà by Fra Bartolommeo of most touching aspect. But Michelangelo's great group in the Vatican is said by many to be unsurpassed in its sublimity.

Mater Dolorosa.— The Divine Mother in anguish. This theme has called forth from the great painters facial expression of excruciating human agony of the most touching and pathetic depiction ever accomplished. The true pathos of sorrow displayed by the Spanish school is very prominent, Murillo's depictions excelling in their pictured anguish and tears. Tradition poses the hands clasped, the veil casting a shadow on the Virgin's head, the face, with its welling tears, glancing upward. At times the Madonna is placed at the foot of the Cross. For the most part the face is of middle age, except as with Michelangelo, who depicts youth and to a critic declared "Purity enjoys eternal youth"; Reni and later artists frequently depict a young maiden. Many of the paintings of the Mater Dolorosa type are but the head, others half-length figures. A beautiful example of Quintin Matsys' is in the London National Gallery. Many of the creations are disfigured by the unnecessary swords depicted as piercing the Virgin's bosom, referring, of course, to Simeon's prophesy. They are supposed to emphasize the pathetic subject — Vandyck uses the weapons.

Other phases of the Madonna theme pictured by masters are many but space forbids further description. Of such are the subjects known in the art world under the titles: "Purification," "Presentation to the Temple," "Assumption," "Last Judgment," "Seven Joys and Seven Sorrows of the Virgin," etc.

CLEMENT W. COUMBE.

MADOQUA, măd'ō-kwą, a diminutive antelope (*Cephalolophus abyssinicus*), one of the duiker-boks (q.v.), common in Abyssinia. The fore-parts are rufous, but gray is the prevailing hue. The same name is sometimes applied to other very small north African antelopes, as the Beni Israel.

MADRAS, British India, the capital of the presidency of Madras, on the Coromandel coast, lies on an open, sandy shore, exposed to the swell of the Bay of Bengal, which breaks upon the beach with great violence. It is 835 miles southwest of Calcutta. A modern harbor formed by two piers obviates the former dangerous passage through the surf. The city is built on level ground and with its nine suburbs occupies 27 square miles. The chief commercial portion is Black Town, now George Town, closely and irregularly built, containing the native and East Indian (or mixed) population, with a few European merchants and their families. On the south is the ancient Portuguese settlement Saint Thomé founded in 1504, with a Roman Catholic cathedral. One of the chief objects of interest is Fort Saint George, which commands George Town and the network of roads, and may be considered the nucleus of the city. It was built in 1639, and is admirably situated for the defense of the town and shipping. It contains a church, the barracks, and an arsenal. The government-house, the cathedral of Saint George and some of the other churches and public buildings, are handsome structures. Besides the university, the Presidential College and a medical college, supported by government, there are large missionary institutions. The public park, containing a small zoological collection, is the chief recreation ground of the city. From the meridian of the observatory connected with the university all India takes its time. Madras is the chief seat of the provincial government offices, of the Supreme Court, a board of revenue, marine board, etc. Notwithstanding the disadvantages of its position it is a place of great trade, and a new harbor has greatly tended to increase traffic. The landing and shipping of goods is effected partly by lighters to the pier-head inside the harbor, and partly by the old *massula* or surf-boats, which land their cargoes on the beach. The imports are chiefly manufactured goods from the United Kingdom, especially cottons, wines, spirits, metals, stationery, etc. Among the principal exports are cotton, grain, indigo, coffee, tea, hides, oil-seeds, dye-stuffs, pepper, etc. The chief industries are connected with the preparation of goods for export, such as coffee pressing and cotton cleaning. Cotton-spinning factories have been established at Madras. The country at a short distance from the city presents a remarkable contrast to its barren sandy shore, having the appearance of a fine park. The mean annual temperature is 82°, which rises in the hot weather to 96° in the shade. The city has railway communication with all the principal places of India, has good water supply and sewerage systems, is lighted by electricity and gas and is administered by a body of 32 commissioners.

Madras was founded in 1639 by the English, who obtained the grant of a piece of ground for the erection of a town and fort (Fort Saint George) from the Rajah of Chandgherry. It soon became a flourishing city and the chief station of the English on the Coromandel coast. In 1746 it was taken by the French, who kept it until 1749, when peace was made and the place was restored to the English by the Treaty of

Aix-la-Chapelle. In 1758 it was again besieged by the French under the celebrated Lally, who was obliged to retreat after a siege of two months. Pop. about 647,000, of whom 88 per cent are Hindus, 9 per cent Mohammedans and 3 per cent Christians.

MADRAS, mą-drăs', British India, a presidency occupying the southern portion of the Indian Peninsula. It stretches from the Bay of Bengal to the Arabian Sea, almost enclosing Travancore and Mysore, while a long, narrow portion extends along the west side of the Bay of Bengal till it meets the Bengal province about 70 miles from the mouth of the Mahánadi. It has a total area, excluding native states, of 142,260 square miles, the area of the native states being 10,696 square miles. Jaipur and Haidarabad bound it on the northwest, while the west borders for a short distance with Bombay. The chief mountain ranges are the Western Ghâts, the Eastern Ghâts and the Nilgiri Mountains. The principal rivers are the Godâveri and Kistna, with their tributaries; and the North Penner, South Penner, Palar, Kaveri, Coleroon and Vaiga. There are no lakes of any importance, but many salt lagoons or inlets of the sea. Extensive forests yield teak, ebony and other valuable timber trees. The wild animals are those common to other parts of India, the elephant, tiger, chetah, bear, bison, elk, spotted deer, antelope, jackal, wild hog, jungle sheep, etc. The climate generally is reckoned the hottest in India, but differs wildly in different localities according to elevation. Of the population, 71 per cent is engaged in agriculture, and 86 per cent of the cultivated area is under food crops. The soil along the coasts, particularly that of the Carnatic, is for the most part light and sandy; inland it consists of a decomposed syenite impregnated with salt, which in dry weather covers the ground with a saline efflorescence. The district of Tanjore on the banks of the Coleroon is esteemed the granary of southern India. The principal vegetable productions are rice, wheat, barley, maize and all the other grains common in India; sugarcane, areca, yam, plantain, tamarind, jack-fruit, mango, melons, cocoanuts and a variety of other fruits; ginger, turmeric, pepper, tobacco, hemp and cotton, for the growth of which the soil seems to be particularly well adapted. Tea is grown to some extent. Weaving is the only indigenous art of any consequence, and cotton cloth, muslins, carpets and silks are manufactured to a limited extent. The grand total of sea-borne trade for 1936–37 was rupees 661,000,000. Of external trade, 66 per cent is with the British Empire, and 33 per cent with the United Kingdom. The government of the presidency is vested in a governor subordinate to the governor-general of India. The revenue usually exceeds the expenditure, but the apparently healthy condition of the finances is largely illusory, as the presidency has been living on windfalls in the shape of grants from the Indian government. At the head of the educational institutions is the Madras University, an examining body, and since 1923 a teaching university, granting degrees in arts, law, medicine and engineering. There are various schools and colleges affiliated to the university.

The province is divided into 22 districts with a population of about 46,700,000. The native feudatory states of Travancore, Cochin, Banganapalle, Puddakotai and Sandur, with a total population of about 5,461,000, were in 1923 placed in direct relation with the government of India. The languages are Tamil, Telugu (spoken by the great majority of the inhabitants), Canarese and Malayalam, with lesser dialects spoken by the more barbaric tribes in the mountains; Mahrathi and Gujerathi in the northern and northwestern parts; Uriya in the northeast; while Hindustani is the language spoken everywhere by the Mohammedans. Capital, Madras (q.v.). See also INDIA.

MADRAS HOUSE, The, is not only an admirable example of the work of Granville Barker as a dramatist but also of the modern type of play written by, and for, those who conceive of the theatre as a place where it is permissible, even enjoyable, to *think* as well as to *feel*. It does not depend for its effect on thrilling situations, violent emotions or cunningly devised mystery but depicts the dramatic interplay of character and circumstance under normal conditions with a skill, insight and humor which afford even more pleasure, perhaps, to the reader than to the spectator. Of all the wide variety of human relations involved in the play, none are dealt with, so to speak, in actual crisis and there is a resulting lack of dramatic tension, but the author succeeds, nevertheless, in making one acutely conscious of the intensity and force of the emotions that underlie the surface not only of the play but of life. The two main themes are business and sex. The particular aspect of business which is presented is one that is unfamiliar in America, namely, the "living-in" system, inherited from the days of guilds and apprentices in England, under which clerks and other employees receive board and lodging as part of their wages. It is obvious that in a large "drapery establishment" employing both men and women, like the Madras House, such an arrangement would be likely to give rise to social complications. The business theme, therefore, although open to the reproach of being local in its application, may boast the charm of novelty for Americans. The sex interest, on the contrary, is of the familiar, universal, all-pervading variety. It inter-penetrates the life of the conventional suburban family, into which we are introduced in the first act; it comes frankly to the fore in the second, in the case of Mr. Brigstock, "third man in the hosiery," and one of the "lady shop assistants"; it pulls the strings during the sale of Madras House to an American millionaire in the third act; and it looms largest of all in the last act, in which that unconscionable old lady-killer, Constantine Madras, finally renounces his family and the trammels of conventional morality and turns Mohammedan. In this, as in his other plays, Barker, following Bernard Shaw's lead, omits the customary list of *dramatis personæ* and introduces his characters in a sort of literary preface to each act which is no less interesting and illuminating than the dialogue. "The Madras House" was written in 1910 and was first produced at the Duke of York's Theatre in London on 9 March of the same year under the direction of the author.

MADRAZO, mä-drä'thō, **Raimundo de,** Spanish painter: b. Rome, Italy, 24 July 1841; d. 1920. He studied under his father, Federigo de Madrazo, and Léon Cogniet in Paris. He was very successful in portrait and genre and numbered many prominent Americans among his sitters. He was equally happy in pastel and oils, and his 'Fête during the Carnival' in Mrs. W. K. Vanderbilt's collection is as brilliant in conception as in technique. Among his most celebrated portraits are those of the Queen Regent of Spain; the Countess Pillet-Will; Mrs. Cornelius Vanderbilt; Mrs. Whitney; Miss Anne Morgan; Madame Madrazo; Samuel P. Avery. 'The End of a Masked Ball' was awarded a first class medal at Paris in 1878 and was subsequently purchased by W. K. Vanderbilt. Other genre works all of a high order are 'Fête during the Carnival'; 'Girls at a Window' (both in Metropolitan Museum, New York); 'Lady with a Parrot' (purchased by W. A. Clark, New York); 'Lady with Guitar'; 'Déjeuner of the Infanta'; 'Pierrette.' Madrazo was made commander of the Legion of Honor. His brother, Ricardo (b. 1852), was also a pupil of his father and achieved some success as a portrait and genre painter.

MADRAZO Y KUNT, Federigo de, Spanish painter: b. Rome, 12 Feb. 1815; d. Madrid, 11 June 1894. His father, José de Madrazo y Agudo (1781–1859), was a painter of note and from him Federigo received his early instruction. Subsequently he studied under Winterhalter at Paris. His early works are 'The Resurrection of Christ' (1829); 'Achilles in his Tent'; 'The Continence of Scipio' and portraits of Baron Taylor and Ingres; 'Godfrey Proclaimed King of Jerusalem' (1837). Thereafter he went to Rome and while there painted 'Maria Christina' (1843); 'Queen Isabella'; 'The Duchess of Medina-Cœli'; 'Countess de Vilchès' (1847), and several portraits. In 1873 he was elected foreign member of the Paris Academy of Fine Arts. After his father's death he became director of the Prado Gallery and director of the Academy of San Fernando. He founded *El Artista,* the pioneer of Spanish art journals; it was followed by *El Renacimiento* and *El Semanario pintoresco.* Of his later works the best known are the genre pieces, 'The New Song'; 'The Cigarette'; 'The Musical Matinee,' etc. His brother, Louis de Madrazo, was also a painter. His best work is 'The Burial of Saint Cecilia' (1855).

MADRE DE DIOS, mä'drĕ dĕ dē'oos, or **AMARU-MAYU,** Bolivia, a river, the chief affluent of the Beni, rising in the Carabaya Mountains, Peru, about 50 miles east of Cuzco, and after an easterly course, south by north, of 900 miles, chiefly through the Bolivian department of La Paz, uniting with the Beni at Rivera Alta, where it is 1,500 yards wide. It was explored in 1865 under the auspices of the London Geographical Society, and since 1881 has been the highway for the exploitation of the rubber forests along its course.

MADREPORE, a genus of coral-forming polyps (see Coral and Coral Islands) containing numerous species from the warmer and tropical seas of all parts of the earth. The true Madrepores increase by budding, the result being usually large branching colonies in which the coral between the cups containing the polyps is perforate and spiny. The different species frequently attain large dimensions and constitute one of the most important elements in the formation of coral reefs. The polyps have 12 septa and 12 tentacles, 6 being large, the other 6 smaller, while a peculiar feature is the presence of 6 U-shaped tubes connected with the œsophagus at either end. The term *Madreporaria* is sometimes used to include all polyps in which the parts are arranged in multiples of six, and which secrete coral on the external surface of the body.

MADRID, ma-drid' (Sp. mä-drēd'), Spain, the capital of the republic and of the province of Madrid, a part of New Castile, situated near the centre of the country, on the left bank of the Manzanares, a sub-affluent of the Tagus. It is built on several low and irregular sandhills on a plateau 2,140 feet above sea-level, and is surrounded by a barren and extensive plain, treeless save in the vicinity of the city, and stretching northward to the snow-capped Sierra de Guadarrama. In winter the climate is exceedingly severe, and even in summer, when the heat is excessive, piercingly cold blasts descend from the mountains. The prevailing winds are the parching southeast *Solano,* and the icy north wind from the Guadarrama. The climate is described in a Spanish proverb as "three months of winter and nine months of hell." The temperature ranges from 18° to 105° F.; is subject to frequent and sudden changes; and between the sunny and shady sides of a street the difference of temperature is sometimes as great as 20°. Madrid was until recently surrounded by a wall 20 feet high, pierced by 5 large and 11 small gates; of these gates 3 remain: the Puerta de Alcala on the east, the Puerta de Toledo on the south, and the Portillo de San Vicente on the west. The streets are distributed somewhat irregularly around the Puerta del Sol, which is in the centre of the capital. The principal streets are broad, long and airy; and the houses are in general well constructed, substantial and of good appearance.

In common with most European capitals, Madrid has undergone much modern improvement; the streets are traversed by electric and horse car lines; are lighted by gas and electricity; the telephone system is efficient; and sanitation has been much improved. The former abundant and pure water supply, is, however, inadequate to the demands of the growing population. Madrid has no edifices of great antiquity. The royal palace, situated at the western extremity of Madrid, is one of the most magnificent in the world. It occupies the site of the original Alcazar (castle) of the Moors, and is of enormous extent, being 470 feet each way, and 100 feet high. The architecture is a combination of Ionic and Doric. It contains a small but splendid Corinthian chapel, and a library of nearly 100,000 volumes, and the armory is one of the finest in the world. The Chamber of Deputies, which occupies an area of 42,700 square feet, has a hexastyle Corinthian portico on the grand façade, destined for the entrance of royalty on state occasions. On the two lateral façades are the entrances for the members. The Royal Exchange and the Bank of Spain are two modern imposing buildings.

Madrid stands far behind many provincial towns as regards its churches, which are, with exception of a few attached to conventual establishments, poor and of indifferent artistic merit. The church of San Jeronimo el Grande is probably the most distinctive. The most important of the charitable institutions are the military hospital, an extensive building in the northwestern corner of the city; and the Hospicio of San Fernando, with schools for both sexes, the pupils being taught various handicrafts. At the southeastern corner of the city stands the general hospital. There are also hospitals for orphans and for foundlings, and numerous charities, mainly of a religious kind.

Madrid has 72 public squares, which are generally irregular both as regards their form and their edifices, as well as deficient in decorative monuments. Of these the Plaza Mayor is one of the largest and most regular. The Plaza de Oriente is adorned with 40 statues of Gothic kings, as well as those of the Asturias, Leon, Castile and Aragon. In the centre is a fine equestrian statue of Philip IV. Among places of amusement the most popular is the Plaza de Toros (bull-ring), a building which is about 1,100 feet in circumference, and capable of containing 12,000 spectators. The Prado, a sort of wide boulevard, about two miles long, running north and south on the east of the city, is the chief promenade, and beyond it is the chief public park, including the Buen Retiro gardens, near which are the new handsome building for various ministerial departments and the new station of the Southern Railway Company. The Royal Picture Gallery which stands in the Prado contains more than 2,000 pictures, including a great many by all the best masters, especially those of Spain. There are also good pictures in the Academy of Fine Arts. The National Library, founded by Philip V, contains 650,000 volumes. The Library of San Isidoro consists of 66,000 volumes. The University of Madrid (the most important in Spain) which arose out of that of Alcalà de Henares, founded in the 15th century, has an average attendance of 5,000 students. There are besides numerous other schools, academies and colleges, public and private, including a normal school, a deaf and dumb institution, a normal school for the blind, a commercial school, schools for engineers, a conservatory of music, an academy for the fine arts with a picture gallery, a veterinary college, an academy of medicine and surgery, etc. The famous monastical and palatial Escorial (q.v.) is 27 miles northwest of the city.

The industries have shown a remarkable development during the last decade, the chief manufactures being tobacco, leather goods, chocolate, beer, shoes, boots, plated ware, coaches, gloves and fans. There is a royal carpet and tapestry factory in the Pacifico suburb. The commerce is important, as Madrid is the entrepôt for all the interior provinces. Retail business is mainly in the hands of foreigners, mostly French, but most of the wholesale trade is carried on by native houses. Madrid has railway communication with Paris and Lisbon, and the chief cities of the Peninsula.

Madrid in the Roman period probably was the insignificant hamlet Majoritum. Under the name Majorit it appears as a Moorish outpost of Toledo when captured in 932 by Ramiro II of Leon. Henry IV about 1461 made some additions to the older town, which was placed on the western eminence over the river. Madrid only began to be a place of importance under Charles V. Declared the seat of the court by Philip II in 1560 the city rapidly grew up at the expense of the older and better situated capitals. It was the creation of a century, and its increase was very slow after the age of Philip IV. The gross mistake of a position which has no single advantage except the fancied geographical merit of being in the centre of Spain was soon felt, and on Philip II's death his son, in 1601, endeavored to move the court again to Valladolid, which, however, was found to be impracticable. The French under Murat entered Madrid in 1808 but soon evacuated it. The French held it again from 1909–12 when Wellington took it and restored it to the Spaniards. After 1873 it suffered greatly from civil struggles and in 1937 it was besieged by Generalissimo Franco, but the city held out through bombardments and air attacks until May 1939 when the Loyalist government surrendered it to the insurgent Nationalists. The population of the city in 1934 was 1,048,072 and that of the province, which has an area of 3,084 square miles, was 1,535,322. No population figures were available after the civil war, 1937–39.

MADRIGAL, a short lyric poem generally on amatory subjects. Those of Tasso represent the finest specimens of Italian poetry.

MADRONA, a large and ornamental tree of California (*Arbutus menziesii*), of the heath family, which often grows nearly 100 feet in height. It has a wide-spreading head, small evergreen leaves and the limbs and large parts of the trunk, where the thin outer bark easily peels off, are bright red. It grows in the foothills, and up to a moderate elevation, but not naturally in the valleys. It is a near relative of the strawberry tree of Europe.

MADSTONE, a vegetable substance or stone which when applied to a wound caused by the bite of a mad dog is said to prevent hydrophobia. The most famous one in the United States is owned by the descendants of a family named Fred, in Virginia. This stone was brought over from Scotland in 1776. It is said to be the one spoken of by Sir Walter Scott in 'The Talisman' and has been religiously preserved as one of the most valuable relics of the age. It is about two inches long by one inch broad, and about half an inch thick, and is of a chocolate color. When applied to the wound it adheres till all the poison is absorbed, when it drops off. It is then soaked in warm milk or water for a time, and when removed the liquid is found to be full of a greenish-yellow scum. It is said that of the 130 cases in which it has been applied for the bite of a mad dog, none ever suffered from hydrophobia. There are said to be three authenticated madstones in the United States.

The belief in a madstone was common hundreds of years ago in the East, and travelers in India in 1677 and 1685 make mention of it. Tradition said it grew on the head of certain snakes. George F. Kunz, a New York expert in gems, identifies the madstone, or snakestone, of the East, with the stone known as tabersheer, which is a variety of opal found in the joints

of the bamboo in Hindustan and Burma. This stone is formed of juice which by evaporation becomes mucilaginous, then a solid substance, and when placed in the mouth will adhere to the palate or cause water to boil. Sir David Brewster says it is found in the joints of diseased corn-stalks and is formed by sap depositing silica.

MADURA, mä-doo'rä, southeastern Asia, an island of the Malay Archipelago, Dutch East Indies, off the east end of Java, from which it is separated by the Strait of Madura. The island is about 105 miles long east to west, and 30 miles broad, with an area of 1,770 square miles. Madura forms one of the 17 Dutch residences or provinces into which Java and Madura are divided, and is administered by a governor or resident. The Dutch first landed in Madura in 1747. It is undulating but not mountainous, and though in general well watered, in some places, especially on the coast, there is a want of water, and the soil is unfertile. The interior, however, is fertile, though not so productive as Java. Maize, cocoanuts, tobacco, Jamaica pepper, tamarinds and salt are the chief products; stock-raising is an important industry; and the exports include also birds'-nests, country cloths, white and striped, poppy-oil, rattan-mats and baskets, etc. The chief towns are Bangkalang (pop. 24,000), Pamekasan (the capital, pop. 22,000), and Sumanap. Pop. 1,843,601, of whom 4,734 were Chinese and 621 Europeans.

MADURA, southern India, the capital of a district of Madras, 344 miles by rail southwest of Madras. It was the capital of the ancient Pandhyan kingdom, for over 2,000 years was the political and religious capital of southern India, and is noted for its interesting architectural monuments, chief of which is the Temple of Minarchi, dating from almost prehistoric times, restored and added to by Tirumulla Nayak (1622–62). It ranks fourth among the seven strongholds of Hinduism, and occupies a parallelogram of 56,000 square feet containing 50 buildings. The city was known to the Greeks and Romans. Cotton and tobacco manufactures and coffee mills, are the principal industries. Madura is the seat of Catholic and American Protestant and other missions, and has several high-grade educational institutions. Pop. 182,018.

MADVIG, mäd'vig, **Johan Nikolai**, Danish scholar: b. Svanike, island of Bornholm, 7 Aug. 1804; d. Copenhagen, 13 Dec. 1886. Educated at Frederiksborg and Copenhagen, he was from 1829 till 1879 professor of Latin in the University of Copenhagen. He took a profound interest in the politics of his country, and from 1848 till 1851 was Minister of Education and Religion. He is best known by critical editions of Latin classics and by his Latin grammar translated into English and most European tongues. His chief works are 'Emendationes in Ciceronis Libros Philosophicos' (1828); 'Cicero's De Finibus Bonorum et Malorum' (1839, amended 1876); 'Ciceronis Orationes Selectæ Duodecim' (1830); 'Cicero's Cato Major and Lælius' (1835); 'Opuscula Academica' (1834–42; new ed., 1887); 'Emendationes Livianæ' (1860); 'Livii Opera' (with Ussing, 1861–66); 'Adversaria Critica' (1871–84); 'Latin Grammar' (1841); 'Greek Syntax' (1846); 'Constitution and Administration of the Roman State' (1881–82); 'Autobiography' (published posthumously, 1887). Consult Sandys, J. E., 'A History of Classical Scholarship' (Cambridge 1908).

MÆANDER, mē-ăn'dẽr, now **MENDERES**, a river of Asia which arises in Phrygia not far from Celænæ. It forms the boundary between Caria and Lydia, and flows into the Icarian Sea between Priene and Myus, opposite Miletus. It covers a course about 200 miles long, is deep and narrow, and navigable only for small vessels. It was celebrated among the ancients for its winding course, and gave its name to the intertwined purple borders on mantles and other dresses, as well as upon urns and vases.

MÆANDRINA, mē-ăn-drī'nä, one of several genera of brain corals, so called from the elongate and meandering cups containing the polyps, which give a spherical mass of these corals an appearance strikingly like the human brain with its convolutions. This appearance is due to the fact that the polyps in their growth do not completely divide, but stretch out into long bands, frequently branching, with many mouths and tentacles, and a common body and digestive cavity. Brain corals occur in all tropical seas, several species being found in Florida and the West Indies. Their solid masses make them important factors in the formation of coral reefs.

MÆCENAS, mē-sē'näs, **Gaius Cilnius**, Roman nobleman: b. between 73 and 63 B.C.; d. 8 B.C. He was the friend of Augustus, and patron of Virgil and Horace. It is unknown where he received his education, but he was intimate with the literatures both of Greece and Rome, and was himself an occasional writer in prose and verse. We first hear of him authentically (40 B.C.) as negotiating a marriage between Octavianus and Scribonia; and in the same year he contributed materially to bring about the Peace of Brundisium, by which Octavian and Antony were reconciled. Two years later he was again employed in reconciling these self-willed potentates; and 36 B.C. he was twice dispatched by Octavian from Sicily to Rome to quell disturbances which had broken out there. He was for these services entrusted with the administration not only of Rome, but of all Italy, when Octavian became emperor with the title of Augustus. His palatial residence and gardens on the Esquiline were the rendezvous of all the *literati* of Rome, and of numerous parasites. But those admitted to his intimacy were the greatest geniuses and scholars of Rome, among them being Virgil and Horace. To the intercession of Mæcenas, Virgil was indebted for the recovery of his farm, and Horace also owed to him many favors. Consult Baehrens, 'Fragmenta Poetarum Romanorum' (Leipzig 1886); Harder, F., 'Fragmenta des Mäcenas' (Berlin 1899).

MAELAR, Lake of. See MÄLAR.

MAELSTROM, māl'strŏm, or **MOSKOESTROM**, Norway, a rapid current or tidal whirlpool off the northwest coast immediately southwest of Moskenesoe, the southernmost of the Lofoten Isles. The current runs with the tides alternately, six hours from north to south and six hours from south to north, producing

immense whirls. The depth of the water around does not exceed 20 fathoms, though immediately to the west the soundings are from 100 to 200 fathoms. When the wind is northwest and opposed to the reflux of the waves it attains its greatest fury, but in ordinary circumstances it may be traversed without difficulty. An imaginative description was given by Edgar Allan Poe in *A Descent into the Maelstrom.*

MAENAD, mē′năd, (Greek, mad woman), in Greek mythology, one of the alternative names for the Bacchaes, the frenzied female companions of Bacchus (q.v.) or Dionysus.

MAERLANT, mär′länt, **Jacob van,** Flemish poet: b. near Bruges, 1235? d. Damme, Belgium, ?1300. Besides writing original poems, he made free translations of French romances into rhymed verse. He rendered the *Biblia Scolastica* of Petrus Comestor into a rhymed Biblical history, but his most ambitious work was *The Mirror of History,* inspired principally by the *Speculum Historiale,* of Vincent of Beauvais. Maerlant, who founded the didactic school in the Netherlands, was one of the most learned men of his time.

MAES or **MAAS,** mäs, **Nicolaes,** Dutch genre and portrait painter: b. Dordrecht, 1632; d. Amsterdam, Nov. 24, 1693. He entered the studio of Rembrandt at Amsterdam about 1650 and studied there about four years, attaining a style of execution and coloring so similar to that of his master that many of his paintings were for a long time believed to be Rembrandt's work. He returned to Dordrecht in 1654, and in the succeeding 10 years he did his best work, which retained the influence of Rembrandt, particularly in coloring. From the time of his going to Antwerp in 1665 his style changed and he abandoned the domestic genre type of work for that of portraiture, and his subsequent pictures show the influence of Van Dyck. So different were the characteristics of the two periods that at one time it was believed that there were two artists of the same name. Of his earlier and better period notable examples are *The Reverie*; *Card Players*; *The Eavesdropper*; *Young Girl Peeling an Apple*; *Hagar's Departure,* long believed to be a Rembrandt and *The Listening Girl.* Numerous other examples exist in the galleries of Berlin, Brussels, Munich, The Hague, Frankfort, and Hanover.

MAESTRICHT. See MAASTRICHT.

MAETERLINCK, mä′tĕr-lĭngk, COUNT **Maurice,** Belgian poet, dramatist, and essayist: b. Ghent, Aug. 29, 1862; d. at his villa on the French Riviera, near Nice, May 6, 1949. He was educated in a Jesuit school in Ghent, and at the university, and in 1886 he was admitted to the bar. On a visit to Paris the next year he came under the influence of Philippe Villiers de l'Isle Adam (1838–1889) and other writers of the symbolist school, and soon thereafter gave up the law to devote himself to literature. He settled in Paris in 1896 but retained his citizenship as a Belgian. In 1911, he was awarded the Nobel Prize for literature, and during World War I he engaged in relief work in France and Belgium; on his 70th birthday the king of the Belgians raised him to the rank of count. He had visited the United States on a lecture tour in 1919, and in 1940, following the surrender of France in World War II, he visited New York City, returning to France several years later to pass the rest of his life writing his memoirs. His works, comprising lyric verse, dramas, and philosophical essays, were written in French, and many of them achieved an international reputation; a large number are available in English translation. While his verse is imaginative, it lacks in any strong degree the melodic quality. Superlatively praised and extravagantly censured, Maeterlinck has described his plays as written for marionettes, and his prose as verse in solution. As a rule his plays depend on mood rather than movement, suggestion of the event rather than its presentation; they are attempts to clothe mystical conceptions in concrete form. His chief absorption is with the mystery of life. The marks of his method have been described as parallelism, symbolism, suggestion, and the use of realistic means for romantic effects. To many, the essays are his ultimate test as a force in literature, the most interesting things that Maeterlinck did. Plays translated into English comprise: *The Princess Maleine* (1892); *Pelleas and Melisande* (1892); *Alladene and Palomedes* (1898); *Aglavaine and Selysette* (1899); *The Death of Tintageles* (1899); *The Blue Bird* (1909); *Betrothal* (1912); *The Wrack of the Storm* (1916); *The Burgomaster of Stilemonde* (1918). English translations of his essays and philosophical works are: *The Treasure of the Humble* (1897); *Wisdom and Destiny* (1898); *The Buried Temple* (1902); *The Double Garden* (1904); *The Life of Space* (1922); *The Magic of the Stars* (1930); *The Hour Glass* (1936). Works on natural history in English translation comprise: *The Life of the Bee* (1901); *The Life of the White Ant* (1926); *The Life of the Ant* (1931); *Pigeons and Spiders* (1936); *The Great Beyond* (1947); and an autobiographical book of memoirs entitled *Blue Bubbles* (1949).

MAEVIAD AND BAVIAD. See BAVIAD.

MAFEKING, măf′ŭ-kĭng, Union of South Africa, town of the Cape of Good Hope province, approximately 750 miles northeast of Capetown. Standing at an elevation of 4,194 feet above sea level, it is close to the border of the Bechuanaland Protectorate; it contains the administrative headquarters of that protectorate, and thus is in the unique position of serving as the capital of a country beyond its frontiers. Mafeking is also the headquarters of South Africa's railway system between Kimberley and Bulawayo, and it is the chief business center for the western Transvaal and Bechuanaland Protectorate. The surrounding district is pastoral, and the town contains creameries and malt and cement works. A mile distant from the town proper, on either side of the Milopo river, is the native *stad,* or town, which serves as headquarters of the Barolong tribe; the chiefs retain administrative and judicial powers there. Mafeking was founded in 1885, after a force under Sir Charles Warren (q.v.) had suppressed the republics of Stellaland and Goshen and effected the annexation of British Bechuanaland (that part of the Cape province in which Mafeking lies). The town was the starting place of the Jameson Raid (see JAMESON, SIR LEAN-

DER STARR), and was the base of subsequent operations against the Matabele. During the South African War a British force under Col. Robert S. S. (later Baron) Baden-Powell (q.v.) was besieged in Mafeking from Oct. 12, 1899, until May 17, 1900. Pop. (1936) 4,666.

MAFFEI, mäf-fâ'ē, MARCHESE **Francesco Scipione di,** Italian dramatist and archaeologist: b. Verona, June 1, 1675; d. there, Feb. 11, 1755. He studied at the Jesuit College, Parma, for five years, and from 1698 at Rome. During 1703–1704 he served as a volunteer in the war of the Spanish succession, being present at the battle of Höchstädt on the Bavarian side. His literary career commenced in 1710 with publication of *Della scienza cavalleresca,* a noteworthy censure of duelling. He was one of the founders of the *Giornale dei litterati,* and he edited, with introductions, some of the best plays of the Cinquecento (q.v.). In 1713 appeared his own play *Merope,* since frequently reprinted, one of the most brilliant successes achieved in the history of dramatic literature. While it lacks a love motif, it is considered a masterpiece of Italian tragedy. Voltaire adapted it for the French stage, declaring it "worthy of the most glorious days of Athens," and it inspired Home's celebrated English drama *Douglas.* His versatility and scientific attainments are shown in subsequent work which include *Teatro italiana* (1723–1725); *Storia diplomatica* (Mantua 1727); *Le Ceremonie* a comedy (1728); and *Verona illustrata* (1732). From 1732 he spent four years in travel in France and England, returning by way of Holland and Germany, and wrote *Galliae Antiquitates* (Paris 1733); *Storia teologica* (Trent 1742); *Dell' impiego del denaro* (1746), justifying loans on interest; and *Arte magica* (1749–1754). He was also associated with Maratori in the great collection of the *Rerum italicarum scriptores* which occupied 15 years and were published in 25 folio volumes (1723–1738). A complete edition of Maffei's works were published in 21 volumes (Venice 1790); and selected *Opusculi litterari* (Venice 1829; Milan 1844). See MEROPE.

MAFIA, mä'fē'ä, third largest island off the east African coast, 11 miles from the mouth of the Rufiji River. It was within that portion of the domains of the sultanate of Zanzibar transferred in 1888 to German East Africa (later Tanganyika Territory). The island, 170 square miles in area, is fertile, supporting large numbers of coconut palms. At Tirene Bay, on the southwest of the island, is the principal harbor, a poor one, and Chobe, the largest village. Traces of early settlement by Arabs have been found at Kua, on the neighboring small island of Dshuani.

MAFIA, or **MAFFIA,** mä-fē'ä, in Sicily, a spirit of lawlessness prevalent among a section of the inhabitants; in a collective sense, those who share such spirit. In popular usage, Mafia came to be regarded as a form of organized criminality operating through a secret society akin to the Camorra (q.v.), but the organization was quite elastic. Its origins are traced to the ill-disciplined forces of gendarmerie instituted in Sicily by Ferdinand IV. The members, known as Mafiosi, were required to prove their daring in a knife duel; they accepted a primitive code of honor, and were sworn to defy all established forms of justice. The movement partook of the nature of the vendetta (q.v.). Reaching its highest pitch about 1860–1870, the Mafia carried on robbery, smuggling, and murder; strongest in and around Palermo, it showed itself also in Italy, and attempts at suppression were made in 1874–1875. The influence of the Mafia was felt among the Italian born population of the United States; various outrages were attributed to the Mafiosi, notably at New Orleans, La., in 1890 and 1895. In Sicily, the Mafia was broken up in 1928 by Mussolini and Cesare Mori, prefect of Palermo.

MAFRA, mä'frä, Portugal, a town in Estremadura province, 20 miles northwest of Lisbon (Lisboa). Its principal architectural feature is a huge monastery which, with cloister and church, was built by John V between 1717 and 1732 to replace a small Franciscan friary. The monastery, modeled after the Escorial, contains more than 800 rooms. The church, richly built and lavishly decorated, has twin towers each containing a chime of 57 bells.

MAGADI, mä-gä'dē, a "lake" in Kenya Colony, East Africa, the surface of which is solid, being entirely composed of carbonate of soda. It lies at an elevation of 1,978 feet above sea level, southwest of Nairobi and immediately north of the border of Tanganyika Territory. Bore holes put down to a depth of 10 feet over an area of 30 square miles has proved some 40 million surface tons of carbonate of soda, and the total deposit is estimated to amount to 200 million tons.

MAGALHAES, mä-gä-lyāēs', **Domingo José Gonçalves de,** VISCOUNT OF ARAGUAYA, ä-rä-gwī'yä, Brazilian poet and diplomat: b. Rio de Janeiro, Aug. 13, 1811; d. Rome, Italy, July 10, 1882. He was educated in medicine, but entered upon a diplomatic career in 1836, when he became an attaché at the Brazilian embassy in Paris. From 1859 till 1867 he was minister at Vienna, and for the next four years he was ambassador at Washington, D.C. At the time of his death he was ambassador at Rome. He began the writing of verse at an early age and attained a considerable reputation, being regarded as the leader of the romantic school of Brazilian poetry. His more important works were *Suspiros poeticas* (1836); *A Confederação dos Tamóios* (1857); *Mistérios* (1858); *Urânia* (1862). In 1834 he published a literary history of Brazil. His *Obras completas* were published in Paris in 1864.

MAGALHAES, Fernando de. See MAGELLAN, FERDINAND.

MAGALLANES, mä gä yä'nās, Chile, a territory lying in the southern extremity of the republic, south of lat. 47° 50′ S. It comprises all mainland between the Pacific and the frontier of Argentina, together with all islands off that coast; the latter include most of the Fuegian archipelago and the western portion of Tierra del Fuego. The total area is 52,271 square miles. The islands are barren, but there are extensive forests on the mountainous mainland. Beautiful bays and fjords are characteristic of the coasts. The climate

is disagreeable and stormy. The animal life is not abundant; the seal and sea-otter frequent the coast and in the sheltered regions east of the Andes cattle, horses and sheep are raised. Coal has been found in the southern part and there are also copper and gold mines. The capital is Punta Arenas. Pop. 29,000.

MAGDA. Sudermann's 'Heimat' ("Home") was the sensation of the theatrical season 1889–90 in Berlin, and the play, either in the original German or in translations commonly bearing the title 'Magda'— the name of the heroine — is probably to be regarded as the most widely known and the most successful drama of the end of the century. Its success is traceable to at least four causes: its theme of revolt against paternal tyranny is one to which the times were sympathetic, its construction is skilful and in every sense theatrical, it contains a number of picturesque episodes and amusing characters, and is distinguished for animated dialogue; but most of all, its heroine is an unconventional, self-assertive, and emotional "new woman" who affords an actress an unusual opportunity for temperamental display. The technique is a clever combination of the naturalism of Ibsen and the methods of the *drame à thèse* familiar in the works of Dumas *fils*. The conventional *raisonneur* — in the person of the Pastor Heffterdingk — mediates between Magda and her father, and debates with each the problems presented by the situation of a prodigal daughter who returns home after a life of moral irregularity but operatic success. We are bidden to despise respectability and admire independence. But the representative of each side is far from being an acceptable champion. Magda's father fails to recognize the difference between a child with duties and a human being with rights, and Magda reveals no conception of the fact that duty is only in part a social obligation and is in its innermost essence an obligation of self-respect. Translated by C. E. A. Winslow (Boston 1896); edited by F. G. G. Schmidt (Boston 1909).

WILLIAM G. HOWARD,
Professor Emeritus of German, Harvard University, Cambridge, Mass.

MAGDALA, măg'dą-lą, or **MAKDALA,** Abyssinia, fortified town on the plateau of Talanto in Shoa, 72 miles northeast of Debra Tabor. The original fort was built on an isolated rock 3,300 feet above the Beshilo, and was stormed and wholly destroyed by the British troops under Sir Robert Napier 13 April 1868, Sir Robert becoming Baron Napier of Magdala in recognition of the achievement. The natural strategic advantages of the position, however, caused the fort to be rebuilt and the town has acquired considerable importance. Altitude, 9,110 feet. Pop. about 4,000.

MAGDALEN, măg'dą-lĕn, a name applied to one of the Marys in the Gospels, derived from her place of birth, or former residence, in order to distinguish her from other women of that name (Matt. xxvii, 56, 61; Mark xv, 40, 47; Luke viii, 2; John xix, 25).

MAGDALEN (môd'lĭn) **COLLEGE,** Oxford, England, originated in Magdalen Hall, founded in 1448 by William Patten, commonly called William of Waynflete, from the place of his birth, bishop of Winchester and Lord Highchancellor of England, who 10 years later added the College of Saint Mary Magdalen. In some respects Magdalen is the most noteworthy college of the university. Five of the fellowships are attached to five Waynflete professorships, of moral philosophy, chemistry, mineralogy, physiology and pure mathematics, established in lieu of the three former lectureships of divinity, moral philosophy and natural philosophy. There is also a professorship of botany. The buildings are noted for their beauty and occupy extensive grounds. Among Magdalen's celebrated alumni are Addison, Camden, Foxe, Gibbon, Hampden, John Lyly, Sacheverell, Selborne, Tyndale and Cardinal Wolsey. Consult Wilson, 'Magdalen College' (1899); Glasgow, 'Sketches of Magdalen College' (1901).

MAGDALEN (măg'dą-lĕn) **ISLANDS,** Quebec, Canada, near the centre of the Gulf of Saint Lawrence, 54 miles northwest of Cape Breton, Nova Scotia, and 100 miles southwest of Newfoundland. Amherst, Alright, Coffin, Wolf, Grindstone, Deadman, Entry and Byron islands compose the group which are politically attached to the district of Gaspé, Quebec. The inhabitants exist chiefly by the fisheries of the adjacent waters; gypsum which is found in veins and hollows, and grindstones from Grindstone Island, are exported. House Harbor on Alright Island, and Amherst where there is a custom house, are the chief settlements. Pop. about 5,000.

MAGDALENA, măg-dä-lā'nä, a river of Colombia, South America, which has its rise in the Andes Mountains in the southwestern part of Colombia, and flows north to the Caribbean Sea. A short distance from the sea, at the city of Barranquilla, the river divides and discharges its waters through two channels. It is about 1,000 miles in length. It is navigable for ocean steamers to La Dorada, 592 miles from Barranquilla, and for small steamers to about 900 miles from its mouth. Magdalena River is the principal route from the sea to the interior of the country, and the work of clearing and canalizing both the upper and lower parts of the stream has greatly increased its importance and value as a means of communication and transportation. Bogota (q.v.), the capital, is largely dependent upon this river for means of communication with places on the coast. The largest tributary is Cauca, whose source is near that of the Magdalena, and part of its course is almost parallel with the main river. Short railroads connect some of the interior towns with the river and its tributaries.

MAGDALENA (măg-dą-lē'ną) **BAY,** an inlet on the west coast of Lower California, in Mexico, one of the best harbors on the Pacific Coast. The inlet or arm of the sea is about 40 miles long and 12 miles wide and is protected by a long, low sand-bar. A town of the same name is situated on the harbor.

MAGDALENE (măg'dą-lĕn) **COLLEGE,** Cambridge, England, was founded in 1542 by Thomas, Baron Audley of Walden, in place of Buckingham College, established by Edward, Duke of Buckingham, in 1519, which had succeeded a monks' hostel for students founded in 1428. There are seven open fellowships on the foundation, and 12 open scholarships. There

are also several exhibitions. The annual Pepysian benefaction, value £50, is in the master's gift, and is usually bestowed upon poor and deserving students. The buildings consist of two courts, restored and altered in 1880, a chapel and hall dating from the 15th century and the Pepysian Library, built in 1688. Samuel Pepys, Charles Kingsley and Charles Stewart Parnell were educated at Magdalene College.

MAGDALENIAN STAGE, a period in the history of Paleolithic man in southwestern Europe when humanity lived largely in caves (wherefore these people are called «cave men»). They had attained a remarkably high degree of skill in the graphic arts, and adorned the interior of caverns with paintings and many objects with engravings of animals and other subjects. See STONE AGE.

MAGDEBURG, măg'dĕ-boorg, Germany, city, capital of the Prussian province of Saxony, on the Elbe, about 88 miles southwest of Berlin. The manufacturing and trade of Magdeburg are extensive, and its facilities for transportation by water and railroad are excellent. Among its industrial establishments are the Gruson Works, noted for their connection with the Krupp Works, the beet-sugar factories and a number of other establishments. It has a large number of excellent schools, gymnasia, a pedagogical seminary, art schools, industrial schools, etc. Magdeburg is a place of great antiquity, being a trading centre in the 9th century. It early distinguished itself in the Reformation. During the Thirty Years' War the town was besieged, stormed and sacked by Tilly, when 20,000 persons are said to have been murdered. Pop. (1925) 292,290. Consult Wolter, 'Geschichte der Stadt Magdeburg' (3d ed., Magdeburg 1901); Dodge, 'Gustavus Adolphus' (New York 1906).

MAGDEBURG CENTURIES, a Protestant history of the Christian Church by centuries, written in Latin in 1562 by Matthias Flacius of Magdeburg and other Lutheran theologians. It first appeared as 'Historia ecclesiæ Christi' (7 vols., Basel 1559–74); a German translation of the earlier part also appearing (Jena 1560–65). German Protestant princes bore the cost of publication. The 'Ecclesiastical Annals' of Baronius (q.v.) were a Catholic reply to the Magdeburg Centuries. See PROTESTANTISM.

MAGDEBURG HEMISPHERES, a celebrated invention of two hollow hemispheres, made of copper or brass, with their edges accurately fitted to each other, and one of them furnished with a stopcock. When the edges are rubbed over with grease, pressed tightly together and the globe thus formed exhausted of air through the cock, the hemispheres, which fell asunder before exhaustion, are now pressed together with immense force. If they are one foot in diameter they will, after exhaustion, be pressed together with a force of nearly a ton. This experiment was first performed by Otto von Guericke of Magdeburg, in 1654, at the imperial Diet at Ratisbon, to the astonishment of the Emperor Ferdinand III and the royal family.

MAGELLAN, ma-jĕl'an, **Ferdinand** (Port. FERNÃO DE MAGALHÃES; Sp. FERNANDO MAGALLANES), Portuguese navigator: b. probably at Villa de Sabroza, Trazos-Montes, about 1480; d. Philippine Islands, 27 April 1521. He served in the Indies with distinction, especially at Malacca, and in 1514 saw service in Morocco. In resentment at his treatment by the king, who had not, he thought, duly rewarded his services, he, with Ruy Falero, a geographer and astronomer, renounced his nationality and offered his services to Spain. Magellan's proposal to seek a western route to the Moluccas was accepted by Charles V, and on 20 Sept. 1519 he set sail from San Lucar de Barrameda in command of five vessels. He passed through the strait which bears his name (see MAGELLAN, STRAIT OF), and on 28 Nov. 1520, reached the great ocean which he called the Pacific from its calmness. With his three remaining vessels he sailed by way of the Ladrones Islands to the Philippines, discovering Samar on 16 March 1521. He caused the king of Zebu to swear allegiance to Spain, but was killed in a fight with the natives of Matan. His vessel, the *Victoria,* under Sebastian del Cano, completed this, the first circumnavigation of the globe. The chief authority for the voyage is a work by Pigafetta, an Italian who accompanied Magellan. Consult Lord Stanley, 'The First Voyage Round the World' (1875); and Guillemard, 'Ferdinand Magellan' (1891).

MAGELLAN, Strait of, the channel which separates the continent of South America from Tierra del Fuego and thus forms a communication between the south Atlantic and the south Pacific oceans. It is upward of 360 miles long, and is of difficult navigation. Its breadth varies exceedingly, the maximum being somewhat over 70 miles. There are a number of bays along the shore and at the southwestern end a group of several small islands. Punta Arenas is the best harbor. The strait was discovered in 1520 by Fernão de Magalhães or Magellan.

MAGELLANIC CLOUDS, *in astronomy,* called the Nubeculæ, Major and Minor, from their cloud-like appearance, two oval masses of light in the southern hemisphere near the pole; often both visible to the naked eye. Sir J. Herschel describes them as consisting of swarms of stars, clusters and nebulæ of every description.

MAGENDIE, François, frăn-swä mă-zhŏn'-dē, French physician and physiologist: b. Bordeaux, 15 Oct. 1783; d. Paris, 8 Oct. 1855. He was the pupil of the celebrated surgeon, Boyer, and at 20 was appointed successively *aide d'anatomie* in the faculty of medicine, and demonstrator. He, however, subsequently devoted himself principally to the practice of medicine, was in 1819 elected a member of the Academy of Sciences and in 1831 succeeded Récamier in the chair of anatomy in the College of France, which he retained until his death. As an experimenter in physiology he occupied a high position and his experiments on living animals were at one time so numerous and involved so much suffering to the animals that the French government deemed it necessary to interfere. The results obtained, however, were of great importance, if they do not absolve him from the charge of cruelty. Among them may be named an original demonstration that the two roots of the spinal nerves are devoted to two separate functions; that the veins are organs of absorption; that strychnine acts upon the

spinal cord and contracts by tetanic spasm the nerves of respiration, thus inducing asphixia; that food destitute of nitrogen is not nutritious, and that prussic acid is a valuable remedy in certain forms of cough arising from irritation in the lungs. He was a prolific author of medical works, the most important of which are 'Formulaire pour la préparation et emploi de plusieurs nouveaux médicaments' (1821), containing an account of the effects of certain plants then recently introduced into the materia medica, and which has been translated into all the languages of Europe; 'Précis élémentaire de physiologie' (1816–17), for many years an important manual for students; 'Leçons sur les phénomènes physiques de la vie' (1836–42); 'Leçons sur les fonctions et les maladies du système nerveux' (1839); 'Leçons sur le Sang' (1839); 'Recherches philosophiques et cliniques sur le liquide cephalorachidien ou cérébro-spinal' (1842).

MAGENTA, mä-jĕn'tä, Italy, town in the province of Milan, 16 miles west of Milan, is situated in a grape region, in which the cultivation of grapes and mulberries and the manufacture of wine are the principal industries. Considerable raw silk is exported. It was the scene of a famous engagement 4 June 1859 between the French and Sardinian forces and the Austrians. The Austrians were defeated, largely through the superior tactics of General Mac-Mahon of the French army. Pop. about 10,000.

MAGENTA, or **ANILINE RED,** a coal-tar dye, which consists of a mixture of the hydrochlorides of rosaniline and para-rosaniline. (See ROSANILINE). It may be prepared from aniline oil by digesting the aniline with arsenic acid or with nitrobenzene and ferrous chloride. When the oxidation is complete the rosaniline hydrochloride is precipitated by the addition of common salt in large excess, the hydrochloride being formed by double decomposition and thrown down because it is but sparingly soluble in salt solutions. Consult Benedikt, 'Chemistry of the Coal-Tar Colors.'

MAGGIORE, mäd'jō'rĕ, **Lake,** one of the largest lakes in Italy, the *Lacus Verbanus* of the Romans, is situated for the most part in Italy, but also partly in the Swiss canton of Ticino. It is 39 miles in length and varies in breadth from one-half mile to five and one-half miles. It is 646 feet above the level of the sea and has a maximum depth of 1,158 feet. The river Ticino flows through it. In the south-western expansion of the lake are the Borromean Isles (q.v.). On the north and west it is surrounded by granitic mountains, 7,000 feet high, on the south and east by vineyard-covered hills. On its shore are a large number of villages and cities noted for beautiful scenery and historic connections.

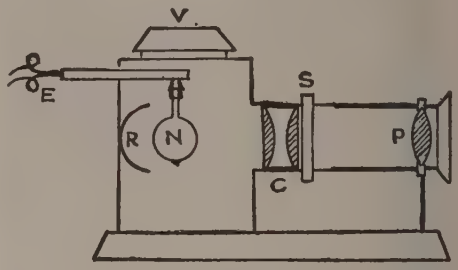
MAGGOT, the larva of a fly. (See FLIES).

MAGI, mā'jī (Lat. *Magus,* Gr. *Μαγος*), an Accadian term recently brought to light by Assyrian scholars; Accadian being the language of the people of Babylon and Media. The word signifies "august," "reverend," and was the title of their learned and priestly caste. The Semitic nations afterward dominant in Babylonia and Assyria adopted the learning and many of the religious observances of the early inhabitants, as also the name for the learned caste; and out of the Semitic form the Greeks made *magos.* Under the Persian Empire the magi were not only the "keepers of the sacred things, the learned of the people, the philosophers and servants of God," but also diviners and mantics, augurs and astrologers. They were held in the highest reverence, and no transaction of importance took place without or against their advice. Hence their almost unbounded influence in both private and public life. Apart from the education of the young princes being in their hands, they were the constant companions of the ruling monarch. Zoroaster, in the course of his great religious reform, reorganized the body of the magi, chiefly by reinforcing the ancient laws as to their manner and mode of life, which was to be one of the simplest and severest, befitting their sacred station, but which had become one of luxury and indolence, and by reinstituting the original distinction of the three classes of *herbeds* ("disciples"), *mobeds* ("masters") and *destur mobéds* ("complete masters"). The food, especially of the lower class, was to consist only of flour and vegetables; they wore white garments, slept on the ground and were altogether subjected to the most rigorous discipline. The initiation consisted of the most awful and mysterious ceremonies, and was preceded by purification of several months' duration. As far as we can learn the principle of good and evil, as represented by Ormazd and Ahriman, was recognized, and belief in the coming of a savior, in the resurrection and in a future life was held. Gradually, however, their influence, which was all-powerful during the epoch of the Sassanian kings of Persia, began to wane, and, from being the highest caste, they fell to the rank of wandering jugglers, fortune-tellers and quacks, and gave their name to sleight-of-hand and conjuring tricks. But the name seems to have been also current as a generic term for astrologers in the East, as is evidenced by the New Testament narrative of the homage of the Magi to the Infant Christ. According to the narrative (Matt. ii, 1–12) the three wise men came from the East to Jerusalem, led by a star, which at length guided them safely to the place of the Nativity at Bethlehem, where they offered their gifts of gold, frankincense and myrrh. As the "Three Kings" their names became celebrated in the Middle Ages, and Bede distinguishes them as Kaspar, Melchior and Balthasar. (See also PARSEES; ZOROASTER). Consult Cumont, F. V. M., 'Oriental Religions in Roman Paganism' (Chicago 1911); id., 'Les mystères de Mithra' (3d ed., Brussels 1913); Moulton, J. H., 'Early Zoroastrianism' (London 1913).

MAGIC, or **BLACK ART,** was formerly the means of producing supernatural effects with the assistance of evil spirits. Doubtless in very remote time magic and religion were practically one, but the development of mentality brought about a differentiation. The fundamental fact was a strong belief in what was considered supernatural. Magic is of a more positive nature, but it carries with it the idea of taboo (q.v.). Supernatural effects were at an early period naturally associated with the exercise of the healing art. In the rudest stage of society this was confined to the women, and naturally arrived at the dignity of a profession in the hands of the older, whom

experience had gifted with superior skill. As their art was for the most part a mystery to themselves, they gradually came to be regarded as objects of fear as much as of hope, and magic medicines became synonymous with poison. The sorceress, poisoner and witch were in time reckoned identical. (See WITCHCRAFT). Mediea, Persia, and the neighboring countries, famous for their knowledge of astronomy and astrology, are described as the chief seats of the ancient Magi, whose doctrine seems to be, in part, of great antiquity. This doctrine represented opposition or strife as the parent and original cause of all things. After the opposition between light and darkness, Ormuzd and Ahriman, was established, the whole series of finite beings, the whole sensual world, proceeded from this constant struggle of light and darkness, good and evil. The change of day and night, light and darkness, the whole series of ages, time itself, is only a consequence of this struggle, in which sometimes light, sometimes darkness, appears victorious, until finally light shall conquer for ever. If all finite things stand under the influence of preserving and destroying powers in nature, it is clear that he who could master these powers could dispose at his pleasure of the things subject to them; and the doctrine of the Magians was that by prayer and a true knowledge of those laws of opposition, love and hatred, light and darkness, such power could be obtained; and that thus also it was possible to pry into futurity. But it was believed that as the world became sinful the light of the ancient doctrine of the Magi was obscured, and those who bore the name became at last only evil-disposed sorcerers. One important branch of their art was now the excitement of love by potions and enchantments. Their love potions consisted partly of ingredients which are still known to the physicians as stimulants, partly of parts of animals who had died longing for food or air, or the saliva of hungry dogs, and other still more disgusting substances. Magic at this period also occupied itself with fortune telling, calling up the dead and bewitching by the look—a superstition which is found existing in the processes against witches in modern times. It can hardly be doubted that the art of the ancient magicians was founded to a considerable degree upon a knowledge of the powers of nature superior to that of the general public. At one time magic was greatly studied in Europe, and many distinguished names are found among its students and professors. The most famous of these are Albertus Magnus, Roger Bacon, Cornelius Agrippa, Michael Nostradamus, John Dee, William Lilly, etc. While magic is a thing of the past there are still many survivals to be found today among the superstitions held by a large number of individuals. Consult Lang, A., *Magic and Religion* (New York 1901); Marett, R. R., *The Threshold of Religion* (New York 1914); Frazer, James G., *The Magic Art* (New York 1925); Thorndike, Lynn, *History of Magic and Experimental Science During the First Thirteen Centuries of Our Era* (New York 1929); Mackay, Charles D., *Memoirs of Extraordinary Popular Delusions* (New York 1929).

MAGIC LANTERN, an instrument used for projecting highly magnified images upon a screen or other adapted surface. A basic type which is shown in the accompanying diagram represents a longitudinal section through a magic lantern fitted with a nitrogen lamp (N), attached to lighting wires (E), and provided with a pair of plano-convex condensing lenses (C). The reflector is indicated at R; the



slot in which the slides are inserted at S; the double convex projecting lens at P; and the ventilating chimney, to carry off excessive heat, at V.

The magic lantern is used to show magnified representations of transparent pictures painted or photographed on glass. The projection is said to be diascopic if the light traverses the object and episcopic if by reflected light. The size of the image will depend upon the brilliancy of the light, hence the circle which it is capable of illuminating. Secondarily the size will depend upon the distance of the lantern from the screen, and the ability to focus the image thereon. See STEREOPTICON.

MAGIC MIRROR OF JAPAN, some few specimens of the small, round bronze mirrors made in Japan which differ from others by reflecting upon a white screen the raised figures on the back of the mirror when a strong beam of light is thrown upon the polished convex surface. The mirrors are made of bronze with a polished, slightly convex face and the backs are decorated with raised ornaments. The characteristics of the magic mirrors was long a mystery, as much to the makers as to others, the peculiarity being apparently accidental. The Japanese themselves, while possessing a reverence for all mirrors, placed no undue value upon the magic mirrors. The Chinese noticed the phenomenon as early as the 11th century and gladly paid fabulous prices for such as possessed the trait. The physical nature of the mystery was first revealed by the French physicist, Charles Cléophas Person, in 1847. He observed that the convex surface of the magic mirrors was not uniform, the portions in front of the ornamental figures being plane, and therefore reflecting direct rays, while the convex portions gave divergent rays and so made the reflection of the images indistinct. The theory was worked out by W. E. Ayrton and J. Perry, who discovered the phenomenon to be due to peculiarities in the composition of the metal in some of the mirrors, the pressure used in polishing the thicker portions containing the raised ornaments resulting in a difference on the reflecting surface too minute to affect the reflection under ordinary light, but plainly apparent when thrown on a screen by a bright light.

MAGIC MOUNTAIN, The. In this long and brilliant novel (1924) Thomas Mann (q.v.) paints a symbolic picture of the dissonance and struggle between two seemingly irreconcilable forces in man's nature: the hypnotic lure of the esthetic, estranging the artist and the abstract thinker from the practical world of reality and robbing him of the strength for action, on the one hand; and on the other his sense of responsibility to that world and his longing for association with the commonplace activities and people of the world of reality. In this dualism Mann sees the disease which afflicted the German middle class before World War I.

In a luxurious tuberculosis sanitarium on a high mountain in Switzerland a group of characters from all parts of the world is gathered, from as far west as Daghestan, from the Graeco-Roman world of Mediterranean culture, from Holland, Germany and elsewhere. Into this motley assembly comes the hero, or rather the central figure (for he is designedly represented as a very ordinary bourgeois individual), Hans Castorp, not at first as a patient. He comes to visit a cousin, planning to stay three weeks, and remains seven years. The author's choice of scene was in itself an almost magical stroke of genius, for the rarified air of the mountain, the boundless horizons of snow, the enforced inactivity of the patients, and the disease itself convincingly symbolize the remoteness from the real world below (the Flatland) and suggest the devitalizing effect of a life of exclusively romantic, esthetic, or metaphysical speculation.

Hans Castorp is constantly exposed to the impact of the divergent attitudes of these characters toward life, chiefly by way of dialectic exchanges and conversations rather than action, for there is no plot in the usual sense. Each of them tries to persuade Hans toward his own particular way of life: the practical realist, the humanist, the romanticist, the sensualist, etc. As they come and go (the scene being what it is, Hans repeatedly finds himself beside a death-bed) his vacillation persists, until, with the outbreak of World War I, he hurries down to the Flatland to fight for his country, his resolve suggesting that he has after all maintained something of a balance between the "two souls that dwell within his breast."

The novel ends on a questioning note which Mann himself calls "the philosophic renunciation of much that I once loved . . . a book of pedagogic self-discipline." See also BUDDENBROOKS, THE, and JOSEPH AND HIS BROTHERS.

WILHELM A. BRAUN,
Professor Emeritus of Germanic Languages and Literature, Columbia University.

MAGIC SKIN, The or **WILD ASS' SKIN** (Fr. LA PEAU DE CHAGRIN), one of the most famous of the novels which make up the imposing series of *The Human Comedy* (*La Comédie Humaine*) by Honoré de Balzac (q.v.). It was also one of the earliest (1831). While it offers abundantly that penetrating observation of human conduct and character and that minute record of the myriad little concrete details of circumstance and environment that condition and explain them, that mark the realism of Balzac and make his work so full of what the French critic Hippolyte Adolphe Taine called "human documents," it is essentially an allegory and enforces, under the form of a magic symbol, a profoundly moral truth. The magic skin is a piece of shagreen bearing this inscription: "Possessing me thou shalt possess all things, but thy life is mine, for God hath so willed it. Wish and thy wishes shall be fulfilled; but measure thy desires, according to the life that is in thee. This is thy life, with each wish I must shrink even as thy own days. Wilt thou have me? Take me. God will hearken unto thee. So be it." The young man who becomes the possessor of this talisman in a moment of suicidal desperation demands of it a princely fortune and sees himself with the power to have every wish gratified. With each exercise of his power, however, he observes with horror that the magic skin continuously shrinks and that his demands on its power bring with them less and less satisfaction. The story is not of even interest throughout, and the narrative of the youth of the hero, which takes up half of the book, may seem somewhat long drawn out. But it is one of the best examples of Balzac's peculiar power of seeing facts and illuminating them with ideas.

Late Professor of Romance Languages, University of Michigan; author of "French Lyrics," "Poems of Victor Hugo," and "Life and Works of Honoré de Balzac."

MAGIC SQUARES. A magic square is a square divided into equal smaller squares, each containing a term of a series of integers, the sums of the numbers in any horizontal, vertical and diagonal line being the same.

The construction of such squares is an amusement of great antiquity. They were known in India and China before the Christian Era, and a knowledge of them was introduced into Europe by Moschopulus who flourished in

Constantinople early in the 15th century. Talismanic virtues and occult properties were ascribed to them by the ancients. They were engraved on metal and stone and worn as amulets, as in India at the present day. A magic square of the fourth order is engraved on the gate of the fort at Gwalior in that country. Mediæval astrologers and physicians were filled with superstitions in regard to magic squares. They associated the squares of the orders 3, 4, 5, 6, 7, 8 and 9 with the astrological planets Saturn, Jupiter, Mars, the Sun, Venus, Mercury and the Moon. A square containing one cell symbolized the unity of the Deity; one of the second order, not being possible, signified the imperfection of the elements air, earth, fire and water. Albert Dürer's well-known painting, 'Melancholy,' contains a magic square of the fourth order, doubtless because of its supposed mystical significance. They have been made the subject of elaborate research by various investigators but the world is indebted chiefly to the French mathematicians for the development of the theory of magic squares.

In this article general rules for the construction of magic squares of any order will be given, illustrated by particular examples. The squares produced by these methods by no means exhaust all possible arrangements, but the rules furnish squares in great number and variety.

Magic squares are divided into two general classes according as the numbers of cells on a side is odd or even. Even squares are subdivided into doubly even, i.e., when the root is divisible by 4, and singly even, when the root is divisible by 2 but not by 4. A horizontal line of cells is called a row, and a vertical line a column. Two cells in a row equidistant from the ends are termed a *horizontal pair*, and two cells in a column equidistant from the ends are termed a *vertical pair*. In a series of natural numbers any two equidistant from the ends are said to be complementary.

Magic Squares of an Odd Order.— La Hire's method for constructing odd magic squares requires the formation of two auxiliary squares A and B. For a square of the fifth order diagram A is formed with the series of natural numbers 1, 2, 3, 4 and 5 as follows: First, put 3 (the mean of the numbers) in the top left-hand corner cell, and the numbers 1, 2, 4 and 5 in the cells of the top row in any order. Next, the number in each cell of the top row is repeated in the cells of a diagonal sloping downward to the right. The cells filled by the same number form a *broken diagonal*. Form a new square by making the left-hand column of A (beginning with its bottom number) the first row in the new square, and so on. Next, instead of the numbers 1, 2, 3, 4 and 5, substitute respectively the numbers 0, 5, 10, 15 and 20, thus producing square B. In each cell of square C place the sum of the numbers in similarly situated cells of squares A and B. The result is a magic square of the fifth order. Any magic square of an odd order can be constructed in a similar manner.

La Loubère's Method.— In order to construct a magic square of an odd order by this method, place 1 in the middle cell of the upper row, and using the series of natural numbers (any arithmetical series will answer) proceed always diagonally upward to the right, except when the edge of the square or a cell already filled is reached. When a number would fall outside the square, carry it to the extreme cell in that row or column in which the cell outside would fall. When a cell is reached that is already filled or when the righthand upper corner cell is reached, place the number in the cell just below. The magic square D is formed by this rule. It may be remarked here that from any magic square, whether odd or even, a number of other magic squares can be formed by the mere interchange of the row and column which intersect in a diagonal with the row and column which intersect in some other cell in the same diagonal. In this way from each magic square of the fifth order 48 other magic squares can be formed.

D

30	39	48	1	10	19	28
38	47	7	9	18	27	29
46	6	8	17	26	35	37
5	14	16	25	34	36	45
13	15	24	33	42	44	4
21	23	32	41	43	3	12
22	31	40	49	2	11	20

Magic Squares of an Even Order.— To construct a magic of the sixth order proceed according to the following rule which is a modified form of a method due to La Hire.

E

1	5	4	3	2	6
6	2	4	3	5	1
6	5	3	4	2	1
1	5	3	4	2	6
6	2	3	4	5	1
1	2	4	3	5	6

F

0	30	30	0	30	0
24	6	24	24	6	6
18	18	12	12	12	18
12	12	18	18	18	12
6	24	6	6	24	24
30	0	0	30	0	30

G

1	35	34	3	32	6
30	8	28	27	11	7
24	23	15	16	14	19
13	17	21	22	20	18
12	26	9	10	29	25
31	2	4	33	5	36

As in his rule for odd squares two auxiliary squares are employed. For a square of the sixth order the first auxiliary square E is constructed as follows: First, fill the cells of the

H

1			4
	6	7	
	10	11	
13			16

I

1	15	14	4
12	6	7	9
8	10	11	5
13	3	2	16

two diagonals with the numbers 1, 2, 3, 4, 5 and 6, beginning on the left-hand side. Second, fill each of the remaining cells of the first column with the same number as that already in two of them or with the complementary number, i.e., with a1 or a6 in any way, provided that there are the same number of these numbers in the column. Third, cells horizontally paired with those in the first column are filled with the complementary numbers. Fourth, the remaining cells in the second and third columns are filled in an analogous way to that in which the cells in the first column were filled; and then the cells horizontally paired with them are filled with the complementary numbers. Observe that in the case of a singly even magic square it will be necessary in constructing E to take care in the second step that in every row at least one cell which is not in a diagonal shall have its vertically paired cell filled with the same number as itself.

The second of the auxiliary squares F is constructed as follows: Rewrite square E, making another square F in which the left-hand column of E (beginning with its top number) becomes the top row of the new

K

71	64	69	8	1	6	53	46	51
66	68	70	3	5	7	48	50	52
67	72	65	4	9	2	49	54	47
26	19	24	44	37	42	62	55	60
21	23	25	39	41	43	57	59	61
22	27	20	40	45	38	58	63	56
35	28	33	80	73	78	17	10	15
30	32	34	75	77	79	12	14	16
31	36	29	76	81	74	13	18	11

square, the second column of E becomes the second row of the new square, and so on. Then instead of each of the numbers 1, 2, 3, 4, 5 and 6, substitute the corresponding number from the series 0, 6, 12, 18, 24 and 30. The result is square F. Next, if in each cell of G the sum of the numbers in the corresponding cells of squares E and F be placed, the required magic square is formed.

The following method is applicable to the construction of doubly even magic squares only. Imagine the square to be divided into squarelets of four cells each, the four central cells comprising one; and conceive these squarelets to be of *two* kinds, alternating with each other. Place 1 in the left-hand upper corner cell, and proceed horizontally to the right counting a number to each cell, but filling successively the squarelets of one kind only. When the end of one row is reached turn to the left-hand cell of the next row and again advance, filling cells of one kind as before, and so on. For the

L

1	63	62	4	5	59	58	8

14	45	16	17	46	21	50	51
57	2	3	61	60	6	7	64

4-square the result of this operation is seen in diagram H.

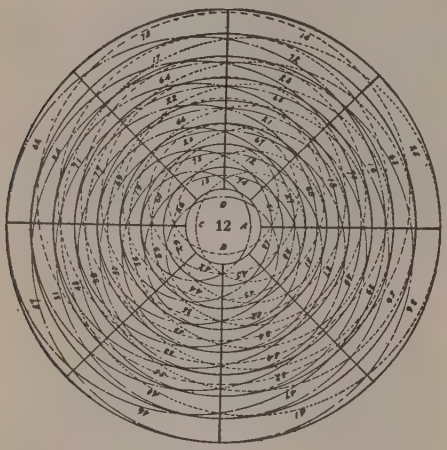
Next, begin with the right-hand lower corner cell, considering 1 as falling on it but not writing the number, and proceed regularly to the left, row after row, filling the empty cells with the numbers belonging to them but not writing numbers in the cells already filled. The result of the two operations is the magic square I. This is the most perfect magic square of the fourth order. Not only do the horizontal, vertical and diagonal lines of numbers sum up 34, but there are 38 other ways in which sets of four numbers may be selected whose sum is 34, making 48 ways in all. By the interchange of rows and columns according to the rule enunciated above, other squares may be formed, but none so perfect as this.

The above methods for the construction of magic squares are, in the writer's opinion, the simplest of all those proposed. Limited space permits only two other methods to be noticed, which, however, are applicable to only a limited class of cases. The first relates to the construction of composite magic squares. For example a square of 81 cells may be considered as made up of 9 smaller squares each containing 9 cells. The magic square in diagram K is built up by this method.

The other method consists in surrounding a magic square with a border of cells, constituting what is termed a concentric square. In

this way from the magic square of the third order can be built up squares of any odd order; and similarly even magic squares of any order may be built up from the magic square of the

M

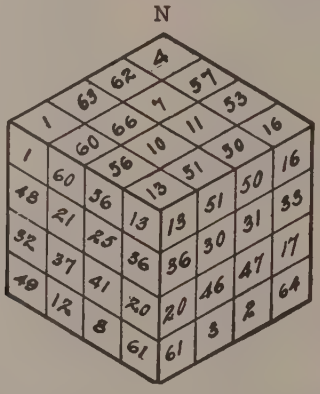


fourth order. Diagram L is constructed this way.

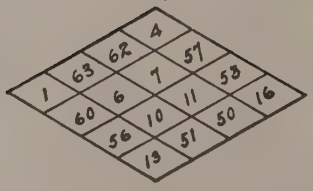
To Dr. Franklin is due the construction of diagram M which he called *The Magic Circle of Circles.* (See the illustration herewith). It is composed of a series of numbers from 12 to 75, inclusive, placed in eight concentric circular spaces and arranged in eight radii, with the number 12 in the centre. Like the centre this number is common to all the circular spaces and to all the radii. The numbers are so placed that the sum of all those in any of the circular spaces, together with the central number 12, is 360, the number of degrees in a circle. The numbers in each radius together with the central number make 360. The numbers in half of any of the circular spaces taken above or below the horizontal diameter, with half the central number, make 180, the number of degrees in a semi-circle. If any four adjoining numbers be taken, as if in a square, in the radial division of the circular spaces, the sum of these with half the central number is 180. There are, moreover, included five sets of other circular spaces bounded by circles which are eccentric with respect to the common centre. The centres of the circles which bound them are at A, B, C and D. The numbers in these eccentric circular spaces possess the same magic properties as the numbers in the first-mentioned circular spaces.

Magic squares have been developed into figures of three dimensions termed magic cubes. Diagram N is a magic cube of the fourth order. 1, 2, 3 and 4 are horizontal sections of N

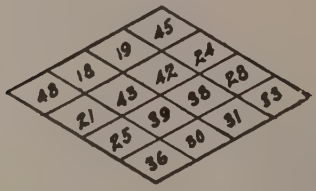
N



1



2



3

4

numbered from the top down. There are 52 ranks of numbers in this cube which sum up 130, namely, 16 vertical columns, 16 horizontal rows from front to back, 16 horizontal rows from left to right, and four diagonal lines uniting four pairs of opposite corners. The sum of any two numbers which are diametrically opposite each other and equidistant from the

32	23	2	11	34	25
1	10	33	24	3	12

centre of the cube equals 65; and the sum of the numbers in the 48 sub-squares of four cells each is 130.

Among curiosities in magic construction may be mentioned the following: The square in diagram O is filled with the natural numbers in the path of a knight returning to its starting cell, and possesses the property that the difference of any two numbers equidistant from and on opposite sides of the centre is 18. It is due to Euler, the famous mathematician.

W. S. Andrews in his *Magic Squares and Cubes* gives a magic cross filled with 145 numbers, with the statement that it contains the almost incredible number of 160,144 different columns of 21 numbers whose sum is 1,471.

A certain class of magic squares has received much attention in recent years. They are called *Nasik squares* in England, and in France *diabolic squares.* They are formed so that the sums along certain lines, such as all the rows, columns, diagonals and broken diagonals are the same. Diagram P is a unique example, as it is composed entirely of prime

P

1013	251	449	911	881
839	1301	941	113	311
41	173	701	1229	1361
1091	1289	461	101	563
521	491	953	1151	389

numbers. It is due to the ingenuity of C. D. Schuldham and appeared in a recent number of *The New York Sun.*

This square possesses the Nasik properties above mentioned, and in addition the sum of any two numbers equidistant from the centre and opposite each other is 1,402, or twice the central number.

Magic rectangles, crosses, stars, cylinders, etc., have been constructed, but want of space forbids any further notice of them.

Varying estimates as to the possible number of magic squares of a given order have been made by different investigators. W. W. Rouse Ball in his *Mathematical Recreations* thinks that those of the fifth order probably exceed half a million. Theodor Hugel in his *Die Magischen Quadrate* has calculated that the paper required to contain all the magic squares of the 13th order would cover the whole surface of the earth about 348 times.

As to the scientific value of magic squares the following paragraph is quoted from a paper by Maj. P. A. McMahon, F.R.S., published in *Proceedings of the Royal Institution of Great Britain,* 1892. "What was at first merely a practice of magicians and talisman makers has now for a long time become the serious study of mathematicians. . . . It was considered possible that some new properties of numbers might be discovered. . . . This has in fact proved to be the case, for from a certain point of view the subject has been found to be intimately connected with great departments of science such as the Infinitesimal Calculus, the Calculus of Operations, and the Theory of Groups."

A. B. Nelson.

MAGIC WOOD, a wood used in cups which were sent to Spain in the 16th century as presents to princes, and were highly valued first as curiosities and later as a means of health. The "magic" consisted in the fact that water put into the cup speedily turned a rich blue. Although it has been a subject of inquiry ever since it is not until lately that the wood has been identified botanically, and the cause of its effect on water is still unknown. The identification was made by William E. Safford, of the United States Department of Agriculture, who described the result of his investigation in *The American Museum Journal* (New York, Vol. XVIII, p. 48, 1918) with a colored illustration. He has discovered that two separate kinds of wood are involved in the history of this matter. The description of the early writers mostly refer to a shrub of Mexico called sweet-wood (*Eysenhardtia polystacha*); but the cups were made of wood of the gigantic narra tree (*Pterocarpus indicus*) of the Philippines. Although very different botanically, both produce effects on water virtually indistinguishable; and as in early times most of the communication between Spain and the Philippines was by way of Mexico, the double confusion as to origin easily arose. When water was poured into the narra cups, or chips of the Mexican sweet-wood were infused in a glass, the water became fluorescent in beautiful colors. In the early accounts of the cups (Pterocarpus) it was said that the water at once turned blue, which deepened if left to stand for some time. When this water was poured into a flask and held to the light it appeared perfectly clear, "but if you move this glass phial toward a more shady place the liquid will assume a most delightful greenness, and if to a still more shady place, a reddish color. . . . In the dark, however, or in an opaque vase, it will once more assume its blue color." As was customary in those days this changeably tinted

water was regarded as having medicinal value, especially in any disorder of the kidneys, and was carried to Europe in great quantities and thus used under the name *lignum nephriticum*. Similar colors were obtained from the Mexican shrub. A few small chips in ordinary tap-water tinged it a golden yellow, which soon deepened to orange. When the glass was held against a dark background the liquid glowed with a beautiful peacock fluorescence very much like that seen in quinine. Placed partly in a sunbeam, half of the liquid appeared yellow and the other half blue; "and when the sunlight was focussed upon it by the lens of a common reading-glass the vial seemed to be filled with radiant gold penetrated by a shaft of pure cobalt."

MAGIE, mà-gē′, **William Francis,** American physicist: b. Elizabeth, N. J., Dec. 14, 1858; d. Princeton, N. J., June 6, 1943. Graduating from Princeton in 1879, he afterward studied at the University of Berlin. He was instructor in physics at Princeton, 1879–1884; became professor in 1885; and was dean of the faculty, 1912–1925. He published *The Second Law of Thermodynamics* (1899); *A Course of Lectures on Physics* (1904); *Principles of Physics* (1911). He translated C. Christiansen's *Elements of Theoretical Physics* (1896), and revised W. A. Anthony and C. F. Brackett's *Physics* (1896).

MAGINN, mà-gĭn′, **William,** Irish author: b. Marlboro's Fort, Cork, Ireland, July 10, 1793; d. Walton-on-Thames, Aug. 21, 1842. He was graduated from Trinity College, Dublin, in 1811, and was for some years a schoolmaster. In 1819 he became a contributor to *Blackwood's Magazine* (using the pseudonym R. T. Scott), and *Literary Gazette*. He was in turn Paris correspondent of *The Representative*, joint editor of the *Standard*, and one of the founders of *Fraser's Magazine* (1830), his contributions to which made it famous. His most popular story was *Bob Burke's Duel with Ensign Brady* (1834). He is portrayed by the character Captain Shandon in Thackeray's *Pendennis*.

MAGINNIS, Charles Donagh, American architect: b. Londonderry, Ireland, 1867. He was educated at Cusack's Academy, Dublin, and won Queen's prize in mathematics at South Kensington, London, in 1883. He came to the United States in 1885, engaged in practice as an architect at Boston in 1886, and became a member of the firm of Maginnis and Walsh. He is especially interested in ecclesiastical architecture. He was a member of the Muncipal Art Commission, Boston (1909–1917), and of the Massachusetts State Art Commission, Boston (1911–1920). He is author of *Pen Drawing* (1898). He is a trustee of the Boston Museum of Fine Arts, and was appointed president of the International Congress of Architects by the United States government.

MAGINOT, mà-zhē-nō′, **André,** French politician: b. Paris, Feb. 17, 1877; d. there, Jan. 7, 1932. A deputy representing Bar-le-Duc from 1910, he was a member of the Democratic and Social Action Party. Undersecretary of war in 1913, he joined his regiment as a private on the outbreak of World War I the following year, received promotions to the grade of sergeant and was severely wounded. On his recovery in 1917 he was elected president of the army committee and severely criticized the conduct of the war. The same year he became minister of colonies in Alexandre Ribot's Cabinet, and was subsequently minister of pensions under Alexandre Millerand, Jean C. G. Leygues, and Aristide Briand. As minister of war in Poincaré's cabinets (1922–1924) he introduced the bill creating the ministry of air (1922). Again serving as minister of colonies (1928–1929), he returned to his preferred post of minister of war in November 1929 in the Tardieu Cabinet, retaining it until his death. His masterwork was the construction of the Maginot Line, so named in his honor. The Maginot Line fortifications protected France's eastern border from Switzerland to Luxembourg with a series of underground forts connected by casements and pillboxes. The Germans in World War II never dared attempt to assault it. Unfortunately, financial and political reasons prevented its extension along the Belgian frontier. See also Fortifications.

MAGINOT LINE. See Maginot, André; Fortifications.

MAGISTRATE. See Court.

MAGLIABECHI, mä-lyä-bä′kē, or **MAGLIABECCHI, Antonio,** Italian bibliographer: b. Florence, Oct. 29, 1633; d. there, July 4, 1714. In the early part of his life he was in the employ of a goldsmith, which he relinquished to devote himself to literary pursuits. Through unremitting application he acquired a multifarious stock of erudition, which made him the wonder of his age. Duke Cosimo III made Magliabechi keeper of the library which he had collected and gave him free access to the Laurentian Library and the Oriental MSS., and of the latter collection he published a catalogue. He left his personal library, Magliabechiana, to the Grand Duke of Tuscany. It is now a part of the Biblioteca Nazionale of Florence.

MAGLIONE, Luigi, Italian cardinal, Catholic churchman and diplomat: b. Casoria, archdiocese of Naples, March 2, 1877; d. there, Aug. 22, 1944. His brother, a priest, supervised his early education. Later he entered a Jesuit school at Naples and from there went to the Gregorian University, Rome. He received his degrees in philosophy and theology at the Gregorian, and later received his degree in canon law at the University of St. Apollinaris. In 1901 he was ordained priest and in 1905 began a two-year course in preparation for the Vatican diplomatic service at the Academy of Noble Ecclesiastics. In 1908–1918 he was professor at the Academy of Noble Ecclesiastics, and in the latter year was sent as representative of the Holy See to Switzerland. In 1920 he was created titular archbishop of Caesarea in Palestine and was made nuncio to Switzerland. In October 1926, Archbishop Maglione became nuncio to Paris, where he remained nine years. His work in Paris was so appreciated by the French government that he was awarded the Grand Cross of the Legion of Honor. On Dec. 16, 1935, Pius XI created him cardinal. Pope Pius sent his red hat for presentation to him by President Albert Lebrun in accordance with accepted custom when affairs at the nunciature prevented his return to the Vatican to receive it. Despite the request of the French government that he be left at Paris,

Pope Pius recalled him to Rome and appointed him prefect of the Congregation of the Council. On March 11, 1939, Pope Pius XII appointed Cardinal Maglione his secretary of state, the office that he himself had occupied under Pius XI.

MAGMA, măg'mȧ, rock which is in a fluid condition due to heat, and commonly said to be molten. For a discussion of the modern conception of a magma see the article on ROCKS.

MAGMATIC STOPING, the process by which a fluid rock mass (magma) heats the overlying rock till it fractures and portions break off and settle into the magma, there to be assimilated or to remain as solid blocks or xenoliths. The process is believed to be important in the mechanics of igneous intrusion.

MAGNA CARTA, măg'nȧ kär'tȧ, or **MAGNA CHARTA** (GREAT CHARTER). In its earliest form this was a grant of liberties extorted from King John of England (1199–1216) in 1215 by a group of rebellious barons. It was reissued with modifications and omissions in 1216 by the regency headed by William Marshall, earl of Pembroke, ruling for the infant Henry III (1216–1272). In 1217 the regency reissued the charter as two separate documents: the charter of liberties and the charter of the forest. In 1225, after Henry III had been declared of age, these charters again were issued in essentially the same form as in 1217. The charters of 1225 became the accepted version and were placed at the beginning of all medieval collections of English statutes. The original text of John's charter was not known to scholars until the 17th century.

Background.—Ever since the Norman conquest of England in 1066 the English kings had striven to develop their power at the expense of that of the feudal class: the barons, their vassals, and their rear-vassals. The barons had opposed this process and had risen occasionally in open revolt. When Henry I (1100–1135) ascended the throne, he issued a charter of liberties in which he promised to stop certain practices of his father and elder brother. Stephen (1135–1154) and Henry II (1154–1189) each issued similar charters. But these promises had little effect on the actual policies of the royal government. All these monarchs with the exception of Stephen steadily increased the royal power.

Henry II's sons, Richard I (1189–1199) and John, followed the example of their predecessors with great enthusiasm. This was particularly true of John. The late 12th and early 13th centuries was a period of rising prices, in which the costs of government also increased rapidly and the incomes of those who drew their revenues directly from the land also increased. The feudal class as a whole was steadily growing richer, but, as most royal revenues were fixed by custom, it was difficult for the king to tap the new wealth. John tried every means which an ingenious and not too scrupulous mind could devise. He abused his feudal rights by demanding exorbitant reliefs when heirs inherited their fathers' fiefs. He sold heiresses in his custody, both maidens and widows, to the highest bidder. John also levied scutages (payments to avoid feudal military service) far more frequently than former kings and on several occasions without actually conducting a campaign. In addition he used novel forms of taxation. He twice collected income and property levies. He experimented with customs duties. Finally he attempted to increase the annual rents or farms owed by the sheriffs for the counties which they administered. John also continually expanded the jurisdiction and hence the revenues of the royal courts at the expense of the baronial courts. In short, while in general John followed the policies set by his predecessors, he did so with extraordinary vigor and with little regard for protests.

At the same time John aroused the personal enmity of many of his barons. He was both cruel and licentious. He either murdered or procured the murder of his nephew, Arthur, duke of Brittany. When the wife of a baron made an indiscreet reference to this crime, John crushed her family's power, drove her husband and one son into exile, and starved the baroness and her eldest son to death in a dungeon. He seduced the sister of at least one great lord, and there probably were similar cases. But perhaps John's chief fault was that he trusted no one and hence no one trusted him.

Baronial Revolt.—In the autumn of 1214, King John returned from an expedition against King Philip Augustus of France. John and his allies had been crushingly defeated. This blow to the king's military prestige greatly encouraged the discontented barons. A group of these lords met at Bury St. Edmunds to discuss their grievances. These nobles not only hated John personally, but also they felt that he had deprived them of specific things to which they were entitled, such as lands, castles, privileges, and hereditary offices.

With the barons was Stephen Langton, archbishop of Canterbury, who had suffered from King John's enmity. Since he had been elected archbishop in the papal court without the king's assent, John had refused to admit him to England. For seven years Langton had waited in France until peace between John and Pope Innocent III allowed him to assume his office. During that time his relatives and friends were driven from England by John. Langton was one of the most able theologists and canon lawyers of his day. Having devoted a large part of his time to applying canon law throughout Christendom, he believed that, just as there was a canon law to govern the internal polity of the church and its relations to the lay world, there should be a recognized system of law to rule the affairs of secular states. Langton persuaded the barons to suppress for the moment their personal hatreds and ambitions and to sponsor a general program which would appeal to the entire feudal class. The assembled barons swore in the abbey church of Bury St. Edmunds that if John refused to grant their demands, they would wage war against the king. While it is impossible to discover which lords attended this meeting at Bury St. Edmunds, it seems probable that they numbered about a fifth of the English baronage.

In January 1215 the rebellious barons conferred in London with their king, who listened to their grievances and promised to give them an answer by Easter. Between January and June 1215, John's policy was extremely complicated. He had no intention of surrendering any of the royal authority and he was certain that eventually he could crush his foes. But only a small part of the four fifths of the English baronage not in the rebel ranks was willing to support the king actively, since most of the barons dis-

liked both parties and remained neutral. Hence John sent agents to Flanders and Aquitaine to hire mercenary troops. He also sent men throughout England to place the royal castles in a state of defense. Then he dispatched messengers to Pope Innocent III, whose vassal he was, to complain of the behavior of the barons. At the same time the king engaged in more or less continuous negotiations with the rebels.

The barons committed their first overt act of rebellion in April, when they gathered in arms at Stamford. Thence they marched to lay siege to the great royal castle of Northampton. Finding this castle too strong for them, they moved against Bedford, which was held by one of their number. The barons knew that John was mustering troops and would soon have an army which they could not meet in the field. Since they needed a secure refuge, they opened negotiations with the citizens of London and on May 17 they occupied the city without meeting any resistance. The capture of London was the victory which won Magna Carta. Since John could hardly hope to collect a force large enough to expel the rebels from the city, his only course was to make peace.

Issuance.—On June 15, 1215, King John and his supporters met the rebel leaders on a meadow called Runnymede lying in the valley of the river Thames between Windsor and Staines. The barons presented to the king a document embodying their demands—the Articles of the Barons. John agreed to accept the demands and ordered his clerks to attach his seal to the document. Then the royal clerks set to work to incorporate the clauses of the articles in a formal charter. This was no simple task. The clauses of the articles were not very well arranged and many were loosely drawn and hence vague. The expert royal clerks rearranged the clauses and tightened the wording. Some changes were made in the text—presumably by mutual consent. On June 19, King John notified his officials that peace had been made and directed them to execute the provisions of the charter, which was to be read publicly in every shire. Thus it seems likely that a complete draft had been made by June 19. But the work of the royal clerks continued. There was to be a copy for every sheriff and for every cathedral chapter—a total of some 47 copies. It seems likely that this task took several weeks. Moreover, since the clerks improved the drafts to some extent as they proceeded, all the copies are not exactly alike. Four of these copies are still extant: one in Lincoln cathedral, one in Salisbury cathedral, two in the British Museum in London. That at Lincoln is generally believed to be the nearest perfect.

Content.—The provisions of Magna Carta fall naturally into three groups. Fifteen chapters treat the feudal relations between the king and his vassals. Thirty-two are concerned primarily with the procedures and policies of the royal administration. These 47 chapters seek to redress general grievances—mostly long-standing ones. They could have been aimed at Henry II or Richard I as appropriately as at John. The last 12 chapters canvass the immediate situation—the king's quarrel with his barons and the resulting revolt. They express practical terms of peace rather than basic principles of law.

The chapters on feudal relations discuss such questions as the relief to be paid by the heir of a tenant-in-chief of the crown, the marriage of ladies in the king's wardship, and the custody of fiefs during minorities. Only one of these clauses is of modern interest. The 12th chapter provides that no scutage or aid could be levied without the "common counsel of our realm" except for three occasions on which aids were sanctioned by feudal custom: the ransoming of the king if he were captured, the knighting of his eldest son, and the marrying of his eldest daughter. The 14th chapter defines the body competent to give this "common counsel of the realm" as an assembly of all tenants-in-chief of the crown. As the king had many petty tenants-in-chief and hence this assembly would have been large and unwieldy, it is rather doubtful that it ever was summoned. This chapter, in fact, was dropped when the charter was reissued in 1216. But the principle embodied in it was observed. John's successors did not levy such scutages or aids without the consent of some assembly. For a while it was usually simply the great council of barons and prelates which was called, but later this became a prime function of Parliament. Hence the principle that the government could not ask for a special levy without the approval of some competent assembly was clearly expressed in Magna Carta.

Most of the chapters dealing with the policies and procedures of the government are also of temporary importance. The problems which they solved were of that day and are now forgotten. Some of them severely hampered the financial administration and were omitted when the charter was reissued. Chapter 21, providing that earls and barons could be amerced only by their peers, is probably the remote origin of the privileges of the peerage. But the most significant clause is chapter 39, which states that no free man can be arrested, imprisoned, deprived of his property, outlawed, exiled, or "in any way destroyed" except by "legal judgment of his peers or by the law of the land." Scholars have argued and will continue to argue about what this meant to the men of the time, but all admit that it forbade arbitrary action by the government. It was a guarantee of "due process of law"—we simply cannot be sure what sort of process is described. In all probability it meant trial in a feudal court by one's peers, when that was the proper procedure for the case, and otherwise by the established customary law.

The last group of chapters discussing John's relations with the rebel barons and their allies are no longer of any interest except to the historian. The last chapter attempted to create machinery by which John could be compelled to observe the charter. Twenty-five barons were to be elected to serve as a committee to hear complaints. If the king refused to correct the grievances which this committee presented to him, they were to wage war on him. The problem was a real one—how to oblige the king to obey the law which he recognized—but the establishment of a partisan commission was not an adequate solution.

Significance.—The conception of government limited by law was implicit in the feudal system. The feudal custom in each fief, be it petty barony or kingdom, was molded by the vassals of the lord in his court. Every feudal lord was subject to the law made in his court. Magna Carta makes this explicit for the kingdom of England. John admitted that he was bound by law. Then chapter 39 (cited above) safeguards the individ-

ual from arbitrary action by the government. It is true that Magna Carta did not apply to all the people of England. Its first chapter clearly defines the beneficiaries: "all the freemen of our realm." This included the whole feudal class, agricultural tenants by such free tenures as socage, and probably the townsmen. The mass of the agricultural population was excluded. But as that agricultural population, the villeins, obtained freedom, they fell heir to the rights granted by the charter. Thus the principles of limited monarchy and individual liberties are embedded in Magna Carta.

Later History.—The Englishmen of the later Middle Ages fully realized the importance of Magna Carta as an admission of the king's submission to the law. Whenever the barons or later the Parliament felt that the king was being too high-handed, they were inclined to insist that he confirm Magna Carta. It was confirmed 44 times before the death of Henry V (1413–1422). For the men of this period it was still a living document. Its next great era began in the reign of Elizabeth (1558–1603). Lawyers and scholars used it to confound contemporary monarchs. This was especially true during the reigns of the first two Stuarts (1603–1649), who were inclined to base their procedure on the practices of the Tudor monarchs (1485–1603) and whose opponents sought medieval precedents to oppose them. Magna Carta was used extensively by the great Sir Edward Coke (1552–1634). And it was Coke and his contemporaries and their immediate successors who wrote the legal treatises which shaped the thought of men like Thomas Jefferson. Thus Magna Carta forms part at least of the background of the political ideas which shaped the United States.

Bibliography.—The standard scholarly work on Magna Carta itself is W. S. McKechnie's *Magna Carta* (Glasgow 1914). The most recent account of the political and constitutional background is given in J. E. A. Jolliffe, *The Constitutional History of Medieval England* (London 1937). Sir Maurice Powicke's *Stephen Langton* (Oxford 1928) is extremely important for an understanding of the charter's relation to the political ideas of the time. Sidney Painter's *The Reign of King John* (Baltimore 1949) discusses the background of the charter and the document itself. For discussion of important details *Magna Carta Commemoration Essays* (London 1917) is very useful. The later history of Magna Carta is thoroughly and ably covered by two books by Faith Thompson, *The First Century of Magna Carta* (Minneapolis 1925) and *Magna Carta, Its Role in the Making of the English Constitution* (Minneapolis 1948).

SIDNEY PAINTER,
Professor of History, The Johns Hopkins University.

MAGNA GRAECIA, măg'nȧ grē'shȧ, "Great Greece," the name commonly given in ancient times to that part of southern Italy which was inhabited by Greek colonists. Apparently the name was in use as early as the time of Pythagoras (586–506 B.C.). Strabo includes the Greek cities of Sicily under the appellation, but the name refers generally only to the Greek cities in the south of Italy, including those on the shores of the Tarentine Gulf and the Bruttian Peninsula, with Velia, Posidonia and Laüs, on the west coast of Lucania. The name was not at first territorial or coextensive with any region, but applied merely to the Greek cities on the coasts. Cumae was the most ancient of all the Greek settlements in Italy, but from its remote position it was in a great measure isolated from the later Greek settlements. The Achaeans were the real colonizers of southern Italy, their first settlement being Sybaris (720 B.C.). A few years later (708 B.C.) Spartan colonists founded Tarentum (modern Taranto), and to counteract their encroachments the Achaeans founded Metapontum, on the frontier of the territory of the Tarentines, between 700 and 680 B.C. The Locrians founded further south the city known as Locri Epizephyrii, nearly contemporary with Crotona (710 B.C.). The Chalcidic colony of Rhegium, on the Strait of Messina, claims to have been more ancient even than Sybaris. The Greek cities on the shores of Bruttium and Lucania were, Velia excepted (540 B.C.), offshoots from the earlier settlements, and not founded by colonists direct from Greece. The arrival of Pythagoras at Crotona (530 B.C.) produced a marked change in the cities of Magna Graecia, and led to the introduction of great political changes. He and his followers were ultimately expelled from Crotona. Very little of the early history is known. The coast cities were essentially mercantile. Trade was well developed, and in the 6th century there was an extensive commerce, especially with Greece. The colonists who pushed to the interior subdued the opposing natives and developed the fertile plains into agricultural settlements. There was a high development of intellectual life. At various times there were temporary alliances among the cities. Warfare was common, and to this fact is largely due the decline of the territory. Magna Graecia comprised the provinces of Campania, Apulia, Iapygia, Lucania, and Bruttium.

MAGNALIA CHRISTI AMERICANA, măg-nā'lĭ-ȧ krĭs'tī ȧ-mĕr-ĭ-kā'nȧ, an ecclesiastical church history of New England, from 1620 to 1628, published by Cotton Mather in 1702. It treats more extensively of the early history of the country than its title seems to indicate, and is divided into seven books: the first treating of the early discoveries of America and the voyage to New England; the second is *Lives of the Governors;* the third, *Lives of many Reverend, Learned and Holy Divines;* the fourth, *Of Harvard University;* the fifth, *The Faith and the Order in the Church of New England;* the sixth, *Discoveries and Demonstrations of the Divine Providence in Remarkable Mercies and Judgments on Many Particular Persons;* the seventh, *Disturbances Given to the Churches of New England.* In the sixth book the author gives accounts of the wonders of the invisible world, of worthy people succored when in dire distress, of the sad ending of many wicked ones, and of the cases of witchcraft at Salem and other places.

MAGNENTIUS, măg-nĕn'shĭ-ŭs, **Flavius Popilius,** Roman emperor of the West: d. Aug. 11, 353. Having been entrusted by Constans with a high military command he availed himself of his office to plot the emperor's overthrow. On Jan. 18, 350, presenting himself in imperial purple at a great banquet given by one of the conspirators at Autun, he was saluted with the title of Augustus; and assassins sent for the purpose having dispatched Constans, Magnentius was acknowledged as emperor by all the western provinces except Illyria. Constantius II, on hearing of his brother's murder, hastened from the confines of Persia and defeated Magnentius (351). These disasters led to the defection of all the countries that had recognized the usurper. Constantius then became master of the entire empire, and Magnentius fled to Gaul, where he committed suicide.

MAGNESIA, the oxide of magnesium, MgO. See MAGNESIUM.

MAGNESITE, a mineral (magnesium carbonate, $MgCO_3$; carbon dioxide 52.4 per cent, magnesium oxide 47.6 per cent theoretically pure) in which silica magnesium compounds, calcium carbonate and iron oxide are always present, with a hardness of 3.0 to 3.5 (Mohs scale) and a specific gravity of 3.0-3.1.

Occurrence.—(1) In crystalline form as magnesite marble or "spathic": as a replacement of dolomite $MgCa(CO_3)_2$, commonly as a resultant of hydrothermal activity by magnesium solutions associated with granitic intrusives. There are deposits in Manchuria, Russia, Austria, Czechoslovakia, Brazil, British Columbia, Quebec, Washington, and Nevada. Colors range widely through the effect of oxidized impurities—blue-black, light red, mottled gray, gray to white. (2) As sedimentary beds it is cryptocrystalline, dense and exceedingly fine. Usually shallow the beds may be of great lateral extent, typical of desert conditions as in San Bernardino and Kern counties, California, and Clark County, Nev. The color is white to gray-white. (3) As veins and replacements in other rocks, notably in the ultrabasic intrusions of California. Associated with serpentine ($H_4Mg_3Si_2O_9$) it occurs in the coastal and Sierra Nevada ranges, also in Baja California (Mex.) and Venezuela deposits. Amorphic, the color is porcelain white.

Uses.—Chiefly for refractory brick and sintered grains as MgO after "dead burning" above 2900° F. The light burned (caustic) powder is used in oxy-chloride flooring especially on ship decks and in public buildings, as a fertilizer addition and as a rubber filler. Synthetic magnesia is produced for the same uses from various brines including sea water.

C. S. SARGENT,
General Manager, Northwest Magnesite Company.

MAGNESIUM, a metallic element whose compounds are abundant and widely distributed, but which does not occur in nature in the metallic form. Magnesium resembles calcium in its chemical deportment, and the oxides of the two metals were long confused with each other. Metallic magnesium was first prepared by Davy, in 1808, both by electrolysis and by the reduction of white-hot magnesia in an atmosphere of potassium vapor. In 1830 Bussy obtained a larger and purer yield of the metal, by heating a mixture of potassium and anhydrous magnesium chloride to redness. It is commercially produced by the electrolysis of the fused anhydrous chloride or the direct reduction of the oxide by ferrosilicon or carbon. Pure magnesium is silvery-white in color, lustrous and moderately hard. It may be hammered, rolled, filed and polished. Its specific gravity is 1.74 and its specific heat 0.246. Its melting point is 651° C. When raised to a bright-red heat (out of contact with the air) it volatilizes, depositing upon cool surfaces again in the form of lustrous silvery crystals which belong to the hexagonal system, and are isomorphous with those of zinc; this property has been commercially used in the production of metal of high purity. It expands by 0.000026 of its own length, per Centigrade degree of rise of temperature; and at 20° C. its electrical resistance is 0.0481 of that of mercury.

Chemically, magnesium is a dyad. It has the symbol Mg, and an atomic weight of 24.32. Its most important compounds are the oxide, MgO, the chloride, $MgCl_2$, the sulphate, $MgSO_4$, and the carbonate, $MgCO_3$. Metallic magnesium is not altered upon exposure to dry air, but ordinary air oxidizes it superficially. It dissolves readily in dilute acids, with the formation of the corresponding salts. Chlorine, bromine, iodine, fluorine, sulphur, phosphorus and arsenic combine with it directly. Red-hot metallic magnesium also slowly combines with free nitrogen to form a solid nitride. In the isolation of argon, helium and the other rare gases of the atmosphere advantage is taken of this fact for separating these gases from the nitrogen of the air. (See ARGON.) When strongly heated in the air, metallic magnesium takes fire and burns with an exceedingly brilliant white light that is rich in chemical rays; the product of the combustion being magnesia, MgO. Advantage is taken of this property in flashlight photography. Magnesium will also burn when sufficiently heated in steam, carbon dioxide or sulphur dioxide.

Magnesium oxide, or "magnesia," MgO, is usually prepared by heating the nitrate or carbonate of the metal; on account of this method of preparation it is commonly known as "calcined magnesia." Magnesia is a white substance, without taste or odor. It does not have a strongly alkaline reaction, but it acts as a powerful base, reacting with acids to form the magnesium salts. It is scarcely soluble in water, but it slowly absorbs moisture and carbon dioxide from the air, becoming converted into a mixture of the hydrate and carbonate. One of the most distinctive characteristics of magnesia is its infusibility, the electric furnace being required to melt it. On account of its infusibility magnesia is used in the manufacture of crucibles and of firebrick.

Magnesium chloride, $MgCl_2$, is prepared by dissolving magnesia in hydrochloric acid. This substance is largely used as a preventive of mildew, in the sizing of cotton cloth. The mineral carnallite contains magnesium chloride, having the composition $MgCl_2 \cdot KCl \cdot 6H_2O$; the chloride is also recovered from the bitterns, or mother liquors, remaining after the crystallization of salt from brine wells in Michigan, Ohio and West Virginia, and as a byproduct in the recovery of potash from langbeinite ($K_2SO_4 \cdot 2\,MgSO_4$) in New Mexico. Magnesium sulphate occurs native (in combination with one molecule of water) as kieserite, and it may also be prepared artificially by dissolving magnesium oxide or carbonate in dilute sulphuric acid. When combined with seven molecules of water, magnesium sulphate constitutes the familiar substance known as Epsom salts (q.v.), which is largely used in medicine. Magnesium carbonate, $MgCO_3$, is a white substance, insoluble in water, but soluble in a solution of ammonium chloride, and also in water that contains carbon dioxide in solution. It occurs in nature as the mineral magnesite, which crystallizes in rhombohedral forms, isomorphous with calcite. Dolomite, which occurs in nature in enormous quantities, is a carbonate of magnesium and calcium.

Magnesium salts are used to a considerable extent in medicine. The name "magnesium" is derived from "magnesia," which substance is said to have been obtained from the province of Magnesia in Thessaly.

Metal Production.—The expansion of the

production of magnesium metal in response to Second World War demands is one of the miracles of war production.

As an industrial metal, magnesium has been on the market for comparatively only a few years; production in the United States in 1932 was under 400 short tons, but had increased to 6,260 tons in 1940, with corresponding increases in other countries, and a world total in 1940 of about 45,000 tons. At that time these increases were considered phenomenal, but they fade into insignificance in comparison with the performance of the next three years, when mushrooming war demands brought developments in months that normally would have required years.

Nothing very specific is known of progress during this period in countries outside of the United States, but the results accomplished here may be taken as more or less representative of the progress that has been made in the other belligerent countries. However, that Germany and Japan had anticipated the coming war demand for magnesium is evidenced by the fact that the 1940 estimates attribute over half the world total to Germany, one sixth to England, somewhat less to the United States, and the remaining one sixth in decreasing amounts to Japan, France, the Soviet Union, Switzerland, and Italy. To this prewar list, Norway was added in 1941, and Canada, beginning in August 1942, the latter with an output of 3,575 tons in 1943.

While there are other uses for magnesium, air warfare claims the bulk of the output, for plane construction, incendiary bombs, illumination flares, tracer bullets, and similar items. As the field of war expanded, and the American plane construction program was enlarged accordingly, the potential demand for magnesium grew by leaps and bounds; a War Production Board estimated requirement of 550 tons a day was considered almost fantastic for a metal which only a few months earlier was being turned out at a rate of 520 tons per month, but almost before people had time to accustom themselves to the first figure, it was raised to 1,000 tons a day. Confronted with such demands, plant construction was started on an unprecedented scale, to supplement the output of the single prewar producer. This one original producer increased the capacity of its plant and built a second, while another company built a third, while the government financed and built 12 additional plants and doubled the capacity of the second private plant. By the end of 1943 these 15 plants were in production, with a rated capacity of 26,000 tons a month, with a maximum output of 21,000 tons in January 1944, practically double the output rate a year earlier.

This output was not the maximum of which the plants were capable of producing, and was only 70 per cent of the planned output, but as it turned out actual consumption failed to reach the high levels that had been anticipated, and by the end of the first quarter of 1944 sufficient surplus had been accumulated to permit a reduction of output. By June 1944 production had been scaled down by 30 per cent, with further cuts in prospect. Total production in 1943 has been reported at 184,000 short tons, with 112,700 tons in the first half of 1944.

These 15 magnesium plants use one of three basic processes for the production of the metal:

(1) Electrolysis of fused magnesium chloride,

(2) Reduction of magnesium oxide by ferrosilicon,

(3) Reduction of magnesium oxide by carbon.

The electrolytic method is preferred, especially if the required chlorides are directly available; if not, the oxide must be converted to chloride. Although the reduction procedure is simple and direct, producing fused magnesium of relatively high purity, the process has the disadvantages of requiring a cell feed of high purity, producing and handling the anhydrous chloride from the hydrated salt; providing means of handling and disposing of the chlorine produced, and providing a large amount of electric power.

The ferrosilicon reduction process is likely to prove somewhat higher in cost, but this is partly offset by the use of the oxide instead of the chloride, and is helped still more by the fact that the oxide need not be pure MgO; a calcined dolomite, containing lime (CaO) works better than the pure MgO. This is due to the fact that the silica (SiO_3) produced by the reduction must be slagged off as a silicate; if pure MgO is used, from one third to one half of the MgO is lost in this way; however, if the cheaper and more plentiful dolomite is used, the CaO does the slagging work, with a corresponding saving of MgO. The calcined dolomite is ground, mixed with ground ferrosilicon, briquetted, and charged into retorts, where they are heated in a vacuum to a temperature of 1100–1200° C. The reduced magnesium is volatilized and recovered as liquid metal in condensers attached to the retorts.

In the carbon reduction a briquetted mixture of MgO and carbon is heated in an electric arc furnace. In this case both products of the reaction are gases—carbon monoxide (CO) and magnesium vapor. If these are permitted to cool normally, the reaction reverses itself, with the reformation of MgO; this can be partially prevented by cooling the mixture to below the reaction temperature so rapidly that the reoxidation can not be completed. This is done by sweeping the mixed gases out of the furnace with a current of hydrogen or natural gas. Even this does not prevent some reoxidation, and the magnesium vapor condenses as a fine droplet of liquid metal, the surface of each particle being covered with a layer of MgO, which prevents coalescence. To obtain a pure metal this powder is charged into a redistillation furnace, from which the metal is again volatilized and condensed as liquid metal.

A modification of the carbon reduction method uses calcium carbide as the reducing agent. It is also possible to use aluminum instead of silicon, but the cost would be prohibitive in a commercial application.

The primary raw material for the electrolytic process (magnesium chloride) may be obtained from the residual bitterns from salt brine wells, from the mother liquors in the recovery of potash from langbeinite, or if necessary by chemical treatment of magnesium oxide. The oxide used in the thermic reduction processes may be supplied from mineral sources (mostly magnesite, dolomite) but at least two large plants use an elaborate process for the recovery of the 0.1 per cent of MgO in sea water and then converting it to the chloride for electrolysis, in preference to utilizing a relatively higher MgO content in mineral form. (See tables next page.)

TABLE I

ESTIMATED WORLD PRODUCTION OF MAGNESIUM, 1938–42, BY COUNTRIES, IN METRIC TONS*

Country	1938	1939	1940	1941	1942
Australia	.....	.....	.....	200	430
Canada	.....	.....	.....	.....	230
France	1,800	2,500	2,000	3,000	3,000
Germany	14,100	16,500	25,000	35,000	50,000
Italy	102	300	500	2,500	5,000
Japan	1,500	2,000	3,000	5,000	12,000
Norway	.....	.....	.....	100	2,000
Switzerland	750	750	750	1,000	1,500
U.S.S.R.	500	1,000	1,500	4,000	5,000
United Kingdom	2,200	4,831	6,500	12,000	16,500
United States	2,918	3,039	5,680	14,782	44,418
Total	23,900	30,900	44,900	77,600	140,100

TABLE II

ACTUAL DOMESTIC CONSUMPTION OF PRIMARY AND SECONDARY MAGNESIUM (MAGNESIUM CONTENT), 1941–42, BY USES, IN POUNDS*

Use	1941	1942	Use	1941	1942
Structural products[1]	21,951,900	63,519,400	Chemicals	27,600	22,900
Aluminum alloys	6,762,200	14,317,200	Other	32,300	23,300
Other alloys	59,000	[2]431,100			
Scavenger and deoxidizer	130,400	211,800	Total	29,346,600	84,525,700
Pyrotechnics	383,200	6,000,000			

[1] Castings, sheet, extruded shapes, forgings, etc.
[2] Includes 396,100 pounds of magnesium contained in 50-50 aluminum-magnesium alloy.

MAGNET WIRE. Magnet wire is a term given to conductors used for winding electromagnets. They differ from other conductors in having thin insulating coverings, and are used on comparatively low voltage circuits in the contruction of electrical devices where electrical energy is to be transformed into magnetic energy, as in relays, solenoids, contactors, transformers, field coils, and armature coils.

The power of "pull" of an electromagnet, or solenoid, depends upon the current in amperes and the number of turns (ampere turns) of the magnet, which produce magnetic lines of force. A reduction of current requires a greater number of turns and, with a "fixed" conductor size, the insulation of the conductor has much to do with the winding space required for a given magnet. For high efficiency and compact design, the wire, and thus the current, should be in as close proximity as possible to the magnetic circuit, or iron, in the magnet or solenoid. Insulation must be thin and flexible, and must possess high dielectric strength. The winding space varies according to the type and amount of insulation necessary for adequate protection.

Since each application of magnet wire has its own particular requirements, there is no universal magnet-wire insulation. There are, however, several different insulations, such as oil-type enamel; synthetic-resin base, including vinyl acetal; cotton; silk; paper; asbestos; cellophane; and glass fiber, which may be used alone or in combination where best suited for space factor, dielectric strength, flexibility, appearance, and resistance to heat, to solvents, and to moisture.

Two Temperature Classes.—The temperature limits on which the rating of electric machines and apparatus is based are largely determined by the character of the insulating materials used. Two classes are defined by the American Institute of Electrical Engineers (AIEE).

Class A insulation consists of cotton, silk, paper, and similar organic materials when impregnated or immersed in enamel; and of enamel as applied to conductors. The limiting "hottest-spot" temperature for Class A material is 105°C.

Class B insulation consists of mica, asbestos, and enamel in organic materials in built-up form combined with binding cement. The limiting "hottest-spot" temperature for Class B material is 125°C.

AIEE recognizes the ability of manufacturers to employ Class B insulation successfully at maximum temperatures of 150°C. or even higher. However, as sufficient data covering experience over a period of years at such temperatures was unavailable, the institute adopted 125°C. as a conservative limit for this class of insulation. Any increase above this figure should accordingly be made the subject of special guarantee by the manufacturer.

Class A Types of Magnet Wire.—The most commonly used Class A types are synthetic-resin coated magnet wire, enamel wire, and enamel single cotton wire. Many other types are available for special applications.

Vinyl-Acetal.—Later developments include magnet wire having a tough insulating film of synthetic resins, including those of the vinyl-acetal type.

Enamel wire has physical limitations that necessitate, in many applications, the use of protective coverings, such as cotton, paper, silk, or combinations. These coverings partially compensate for the physical limitations of the enamel film. However, because of the space they take up, these coverings increase the size—and hence the cost—of finished apparatus.

Formvar wire, in addition to having excellent electrical characteristics, has outstanding mechanical properties. It is remarkably strong, tough, and flexible, and needs no additional protective covering. It thus has many advantages: its first cost is generally less than that of fabric-covered

D.S.C. = Double Silk Covering. S.C.C. = Single Cotton Covering. D.C.C. = Double Cotton Covering.

From *Electrical and Radio Dictionary* by Gorder, Dunlap and Haan. Courtesy of American Technical Society.

enamel wire; it is smaller, and thus allows the use of the same amount of copper in less space, or more copper in the same space; it permits higher winding speed with fewer rejections; it saves on varnish treatment, and under severe conditions it will last much longer.

Formex is available in round sizes No. 10 to No. 40 awg. inclusive, with insulation thicknesses comparable to National Electrical Manufacturers Association (NEMA) standards for single and heavy enamel wire.

Enamel Magnet Wire.—Enamel wire differs from vinyl-acetal wire in that the base of the varnish is of the conventional-oil type instead of being of synthetic resin. Its electrical properties are about the same, but it has not the same high degree of physical toughness. Its first cost is lower, and it is available in all standard types and sizes.

Cotton-covered Wire.—This type consists of a wrap, or wraps, of specially selected cotton yarn applied over the conductor (either bare or enameled), producing a closely wrapped uniform covering which may serve as a protection to the enamel film against physical abuse during winding and assembly operation. It is available in all round, rectangular, and square standard types and sizes.

Other Types.—Among other types of magnet wire that are quite widely used are: enamel double cotton, single and double silk and enamel single silk, artificial silk covered, bonded cotton covered, paper insulated, and litzendraht (litz) wire. (Litz wire is made up of a number of fine, separately insulated strands, woven together in such a way that each strand successively takes up all possible positions in the cross-section of the entire conductor. This type reduces skin effect, which means lower resistance to high frequency currents.)

Class B Types of Magnet Wire.—There are only two Class B types of magnet wire, but at least three varieties of each type are available.

Asbestos-insulated Wire.—Asbestos-insulated magnet wire consists of nonferrous asbestos applied with an adhesive directly to the bare copper. The outer finish may be one of several varieties. The three below are the most common: (1) brown (varnish treated); (2) black (asphaltic base); and (3) white (untreated asbestos).

Round and square wires are made to have the same overall dimensions as does double-cotton magnet wire. This facilitates the changing of a double-cotton winding to a Class B type, because the same slot space would be required for the cotton magnet wire as would be required for the asbestos-insulated type.

Asbestos-insulated magnet wire is used principally where high current densities and operating temperatures are such that Class A magnet wire would fail because of heat.

For specialized applications, particularly where a wire with a higher voltage breakdown is required, it is recommended that an enameled conductor be used, with asbestos insulation overall.

Practically all Class B requirements can be met with the brown (varnish-treated) magnet wire. There are certain applications, however, that lend themselves particularly well to the black type of insulation, particularly where severe edgewise bends are to be made. The white wire is recommended for those applications where there is a maximum of heat and practically no moisture.

Glass-insulated Wire.—Glass-fiber-insulated magnet wire is commonly manufactured in three types: (1) double glass; (2) single glass; and (3) enamel single glass.

The choice of these wires depends upon the space permissible in the winding, and on the dielectric strength necessary.

Glass insulation is applied over the conductor as a wrapping of yarn, much as in the cotton-covered type. However, it is always necessary that an adhesive be used between the conductor and glass wrap; also, the glass should be impregnated with a finishing varnish. The varnish increases the resistance to abrasion.

Where increased dielectric strength is necessary, enamel single-glass or enamel double-glass wire is recommended.

For all types of asbestos- and glass-insulated magnet wires, both square and rectangular wires can be furnished.

Selection of Magnet Wire and Magnet Wire Symbols.—The selection of magnet wire depends upon many factors, such as finish, space factor, dielectric strength, resistance to abrasion, oils, solvents and moisture.

Symbols.—There are also many types of insulation used for covering magnets, each represented by a letter or group of letters, as follows:

MAGNET WIRE SYMBOLS

MAGNETIC DIP, the angle formed with the horizon by a magnetic needle free to move vertically in the plane of the magnetic meridian. It is also called *inclination* and *dip of the needle.* At the magnetic equator it is 0°, and 90° at the magnetic poles. See also DECLINATION NEEDLE; DIPPING NEEDLE; MAGNETISM.

MAGNETIC FIELD. See ELECTRICAL TERMS.

MAGNETIC FLUX. See ELECTRICAL TERMS.

MAGNETIC MOMENT. See MAGNETISM.

MAGNETIC POLE, either of two spots on the earth's surface toward which the compass needle points from any direction throughout adjacent regions. The North Magnetic Pole is at north latitude 71°, west longitude 96°, and the South at south latitude 72-73°, east longitude 156°. See also MAGNETISM.

MAGNETIC SEGREGATION, a process or processes in the preparation of ore by which the more valuable minerals are separated from the waste material and from each other by the use of magnets. A usual type of segregator consists of a belt conveyor carrying the ores below the magnet which raises the magnetic ore to another belt traveling at right angles to the first. As it passes out of the magnetic field the segregated ore drops into a receptacle. By weakening or strengthening the magnetic field it becomes an easy matter to separate the nonmagnetic from the magnetic, and the weakly magnetic from the strongly magnetic.

MAGNETISM, the name applied to a peculiar force action first observed in connection with certain iron ores. This ore, often called lodestone, is supposed to have been discovered in Magnesia, a part of Asia Minor. It is not possible to state just when this discovery was made, but certain passages in Lucretius show that something was known concerning it before the beginning of the Christian era. About the year 1200 we have the statement that a lodestone free to turn takes up a definite position in space. Some further details were noted by Peregrinus Proteus (1269), but the greatest of the early works is that of Dr. William Gilbert, a physician, who published his *De Magnete, Magneticisque Corporibus* in 1600. Those interested in the history of the subject may consult the *Intellectual Rise of Electricity* by Park Benjamin, in which an excellent historical sketch may be found.

The only direct evidence that a body is magnetic is its ability to exert a force on certain substances, which, by reason of their susceptibility to this action, are called magnetic substances. A lodestone brought in contact with several small bodies will select those of iron or steel, if such be present, but show no appreciable force on copper, lead, wood or in fact on any except iron, nickel, cobalt, certain rare metals and certain alloys of relatively nonmagnetic metals, and a few others to a lesser degree. Of even greater interest and importance is the fact that the lodestone is able to endow steel or iron with the ability to exert this force. Soft iron loses its external magnetic qualities when removed from the immediate neighborhood of the exciting source, but hard steel or iron will retain this property for a long time. If a bar or rod of hard steel is drawn across a piece of lodestone or other permanent magnet and is then suspended so as to be free to turn about a vertical axis, it will take up a definite position; usually its line of greatest length will be approximately north and south. If it be plunged into a box of iron filings, little magnetic action will be manifest near the middle of the bar, but near the ends considerable quantities of filings will be attracted and may be lifted against the action of gravity. These facts led to the naming of the regions of greatest external action the poles of the magnet and since the lines joining these regions would, in the case of a freely suspended magnet, lie in many places nearly north and south, the pole which seeks the north is often called the north-seeking or positive pole, and the other which turns toward the south is correspondingly named the south-seeking or negative pole. The entire subject was formerly studied with reference to the behavior of like and unlike poles, and it was even supposed that these poles consisted of opposite sorts of magnetic matter. Later investigations have developed methods less directly dependent upon the idea of poles, which are preferable for many purposes.

If we suppose two long magnets placed as shown in Fig. 1, a study of their mutual force

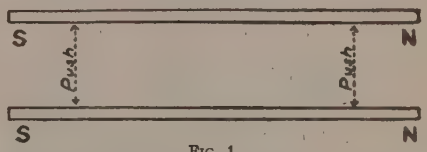

FIG. 1.

action would indicate that each is exerting a push tending to increase the distance between them, and that the amount of this repulsion will vary with the distance between the magnets. If one of the bars be replaced by another whose magnetic quality is different the force action will be modified. If one of the magnets be reversed in position a corresponding force tending to reduce the distance between the bars would be observed. It is convenient to use as a preliminary definition the statement that a unit pole is one which would exert unit force upon a precisely equal pole at a distance of one centimeter. The law of pole action can then be stated by saying that the force is equal to the product of the two poles' strengths divided by the square of the distance between the two poles.

If a freely suspended magnet is brought into

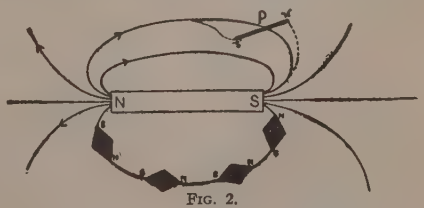

FIG. 2.

the neighborhood of a large bar magnet as indicated in Fig. 2, it will be observed to take up a position somewhat as indicated in the lower

part of this diagram, as its point of suspension is moved along the line. The region where this directive force is noticeable is called the *field* of the magnet. (Gilbert's «orb of virtue»). If continuous lines are drawn, which at each point have the direction taken by the free magnet, these lines are called lines of magnetic force, and they offer a very convenient method for a general study of magnetic action. While these lines have no objective existence, it is, nevertheless, desirable to imagine that they are real and that they possess certain definite qualities. They should always be considered as being directed away from the north-seeking or positive pole. In the early conception of magnetic action these lines would have been regarded as the lines of flow of the magnetic material, and the word flux, still in use, bears evidence of this conception. It is convenient also to regard the lines of force as being under tension and capable of repelling each other. The number of actual lines of force which could be drawn about a magnet is infinite. For purposes of comparison, however, it is customary to represent the force action at a point upon the unit pole placed at that point by the number of lines drawn per square centimeter on a surface perpendicular to the field. A unit field is one in which a force action upon a unit pole is one dyne, about the weight of 1–1000 of a gramme.

In order to compare magnets and to facilitate magnetic computations, certain methods of measurement have been devised. Only a brief sketch can be given here, as full details of these operations may be found in books devoted to this subject, some of which will be mentioned at the end of this article. When a bar magnet is placed at right angles to the lines of a uniform magnetic field it will experience a twist tending to place it along these lines. The amount of this twist will depend upon three things. First: The pole strength of the magnet in question. Second: The distance between the poles. Third: The strength of the field where it is placed. The product of the pole strength by distance between poles is called the magnetic moment of the magnet. When a magnet is suspended freely and slightly displaced from a position parallel to the lines of force it will vibrate about this position. The time required for a complete swing is found to depend upon the magnetic moment, the moment of inertia and the strength of the field where the magnet is placed. The vibration period may be directly observed and the moment of inertia computed from the dimensions and weight of the magnet. In this way the product of the magnetic moment by the field strength may be found. If the same magnet is held with the line joining its poles east and west it will cause a small freely suspended magnet some distance to the east or west to turn slightly from its equilibrium position. The amount of this deflection depends on the distance between the magnets and the ratio of *magnetic moment* to *field strength*. If we denote the magnetic moment by ml and the field strength by H, the product of ml times H is found from the time of vibration, and by means of the deflection of the small auxiliary magnet $\frac{ml}{H}$ may be determined. When ml times H or ml divided by H is known either ml or H is readily computed. When the field at any point is known, a comparison of the time of vibration of a magnet at the known point with its period when vibrating at any other point enables us to compare the two fields without further measurement. The law of change being that if periodic time is doubled the field strength would be four times as great; or the period varies inversely as the square foot of the field in which the magnet vibrates.

The facts mentioned above regarding the ability of a magnet to cause pieces of neutral iron or steel to show magnetic properties is frequently spoken of as magnetic induction. The general phenomena can be readily remembered if we imagine that it is easier for lines of magnetic force to pass through iron than through air. Small pieces, as shown at P, Fig. 2, would have lines entering at «S» and leaving at «N» and would behave as small magnets placed in corresponding positions. Owing to the tension of the lines of force these small pieces would tend to set themselves nearly parallel to the undisturbed direction of the lines. If a sheet of glass or other non-magnetic material is placed over a magnet and iron filings are sprinkled on its surface, a slight tapping, sufficient to overcome friction, will enable the lines of force to arrange the small temporary magnets parallel to the field. In this way maps of magnetic fields may be readily found, and their study throws considerable light upon many de-

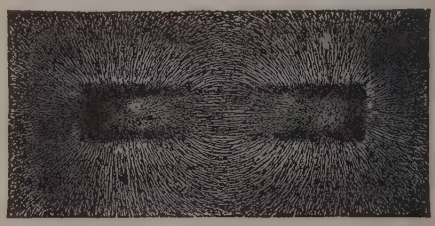

FIG. 3.

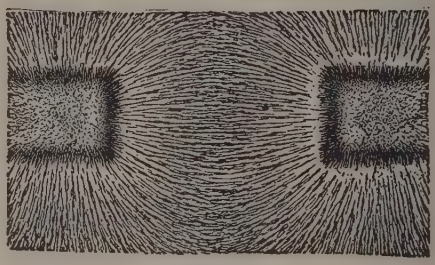

FIG. 4.

tails of these peculiar phenomena. Such fields are shown in Figs. 3 and 4. If a sphere of iron or cobalt is free to move in a magnetic field which is not uniform, a tendency is always observed for the iron to place itself in the strongest part of the field, or so that as many of the magnetic lines pass through it as possible. Such a substance is called paramagnetic. Some substances, as for example a sphere of bismuth, will tend to move to the weaker portions of the field, indicating that it is more difficult for magnetic lines to pass through the material than through air. These are called diamagnetic bodies.

The importance of magnetic action in both theoretical and practical affairs is due largely

to its intimate connection with the phenomena of the electric current. In fact it is absolutely impossible under any conditions to have an electric current flow in a conductor without producing a magnetic field. In the case of a long straight wire carrying current the magnetic lines are circular in form, concentric with the wire, and their planes are perpendicular to its axis. If a wire is wound in a long, straight, cylindrical coil, frequently called a solenoid, and a current be passed through it, the field produced will be nearly identical with that of a bar magnet, the difference being that the lines of force are entirely in air and are not modified by the peculiar properties of iron. By increasing the strength of the current and the number of turns of wire, a comparatively strong magnetic field may be produced at the centre. A piece of soft iron or steel inserted in the coil becomes a powerful temporary magnet, while strips or bars of hardened iron or steel would in the same way become permanent magnets. The requirements of modern electrical processes have led to very careful investigations of the magnetic behavior of iron in connection with the production and the measurement of electric energy. Only a brief sketch of the fundamental features can be given here. If we suppose an electric current flowing in a long solenoid, which does not contain an iron core, the strength of the magnetic field through the inside of the solenoid may be readily computed from a knowledge of the number of turns of wire and the strength of the current. The symbol H is generally used to indicate the field strength when iron is absent. If now a bar of iron be inserted it will be found that the magnetic field is greatly increased. The new field will depend partly on the original value of H and partly on the quality and previous magnetic history of the iron inserted. The symbol B is generally used to denote the intensity of the field when iron is present. It may then be stated that B equals μH, where μ is a variable factor depending on the nature of the iron and the field strength; this factor is called the *permeability*. The original field H is frequently spoken of as the magnetizing field and the new one as the induction. Or H stands for the number of lines per square centimeter where iron is absent and B stands for the number of lines per square centimeter in the iron. If iron, in a neutral magnetic condition, is placed in a solenoid and the electric current is gradually increased from zero the iron will be subjected to a steadily increasing magnetizing field. A comparison of corresponding values of B and H in such a case leads to very important results. The relation between these values is best explained by reference to a curve drawn by using these quantities as co-ordinates. Such curves, usually called the curves of magnetization, are shown in Fig. 5. It should be observed that when H is almost zero, the induction is very small, then B increases more and more rapidly with a rising field until at point two the rate of increase of B with H begins to fall off rapidly, and shortly a value of B is reached which cannot be materially increased no matter how strong a magnetizing field is used. For example in the specimens shown it is useless to extend the value of H much above 70, and in actual practice this limit would be taken much lower. When as many lines as possible are carried through the iron it is said to be saturated. The exact shape of the magnetization curve will depend upon the nature and previous magnetic history of the specimen, but the ratio B-H at any point gives the ability of the iron to multiply magnetic field strength for that particular

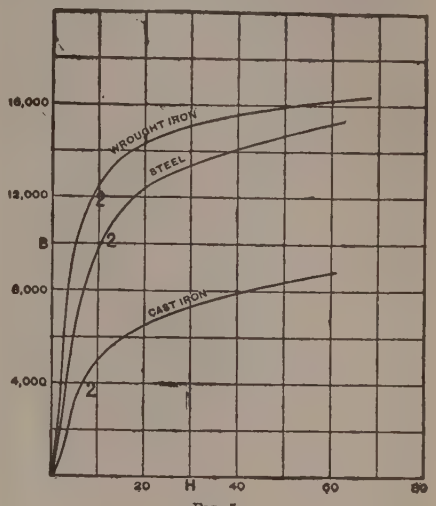

FIG. 5.

field. If, however, any definite state of magnetization is attained as at the point M, Fig. 6, it will be found that upon reducing the field, H, the values of the induction, B, will not agree with those found for the same value of H when the field was increasing. In fact if H be changed to zero and then to negative values and back again to the former condition the value of B will form a loop as indicated. This peculiar lag of the induction when the field is

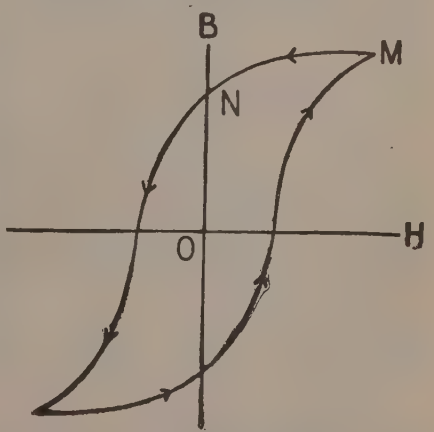

FIG. 6.

reduced is called hysteresis, and the hysteresis loop as shown is of practical importance because its area enables one to find the work converted into heat when the magnetization is carried through one complete cycle. The line ON measured the residual magnetism, which is

semi-permanent, and will be greater in hard than in soft iron or steel. No matter where the process of magnetization is stopped a series of cyclic changes of the magnetic field always gives corresponding loops.

A theory due to Weber and later improved by Maxwell which is useful in the correlation of the various phenomena observed in the magnetic behavior of iron is at once suggested by a simple experiment. Take a magnetic steel needle and which shows distinct polarity. Upon being broken into two parts it will be found that instead of securing two isolated poles, that each piece possesses a plus and a minus pole practically identical with the poles of the original needle. Carry this process to any length and each little piece, however small, will be found to possess two poles, one positive and the other negative. If we assume that this process could be carried on to the smallest conceivable particle of the iron we should say that each molecule of the iron is by itself a magnet. We may further suppose that the molecular magnets in a neutral piece of iron are entirely devoid of regular arrangement as regards position of the poles; such a chaotic condition may be indicated roughly by Fig. 7. It may be supposed that these molecular

Fig. 7.

magnets are partly held in position by the action of forces analogous to friction, which also tend to hold them in any new position to a greater or less extent in case the original arrangement is disturbed. Under the action of a weak magnetic field these friction forces would prevent the turning of the molecular magnets into parallelism with the field lines. As soon as the field is strong enough to overcome this sort of friction we might expect the same tendency to arrangement of these minute magnets that is observed in the case of iron filings in the mapping of magnetic fields. As long as a considerable number of the axes of these molecular magnets make fairly large angles with the field lines the leverage by which turning is produced would be considerable; if however they approach parallelism with each other and the field lines, the effective twisting would be very materially reduced. This would correspond to the approximate saturation of the iron and no considerable change in position could be produced by increasing the field strength. The general arrangement may be indicated approximately in Fig. 8, where

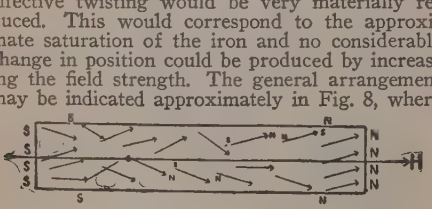

Fig 8.

it will be observed that there is a tendency for free positive poles to appear at one end, namely, where the field lines leave the iron, and for uncompensated negative poles to appear at the other end.

The facts in favor of this sort of explanation may perhaps be briefly summarized as follows: (1) the general shape of the magnetic curve is explained. (2) As friction or other molecular forces tend to prevent a return to the original chaotic condition after magnetization this arrangement would in part persist after removal from the field, or permanent magnetism would be explained. (3) Soft iron should be easier to magnetize and less permanent than hardened iron or steel. (4) Jarring as by blows tends to reduce friction and to assist in the process of magnetization and also to reduce permanent magnetism. (5) High molecular activity consequent on rise of temperature decreases magnetic action, in fact, at a dull red heat iron is non-magnetic. (6) Rapid reversals of magnetism involve work against molecular forces and the production of heat, this heat is proportional to the area of the loop. (7) A tube of iron filings or a set of pivoted magnets shows the same behavior in a rising or falling magnetic field as a solid bar. The precise agreement between experimental facts and the indications from theory shown above makes this conception extremely useful. Just why molecules of iron should be permanently endowed with magnetic properties is a subject for speculation which has been indulged in by numerous prominent scientists. It has been supposed for example that electrical currents flow around these molecules, that they consist of vortex rings or that small electrically charged parts are in vibration in such a way as to produce the phenomena of permanent molecular magnetism. The general usefulness of the hypothesis is in no way connected with the truth or falsity of such speculations any more than the facts regarding free fall are dependent on our view of gravitation.

The general statements noted above regarding magnetism of iron are of importance in the manufacture and utilization of magnets for various purposes. Where a considerable amount of permanent magnetism is undesirable, soft iron or steel is always used. For the manufacture of permanent magnets special steel is selected and hardened and is then magnetized by its insertion into a solenoid carrying a powerful electric current. Severe shocks or blows are frequently given in order to assist in the molecular rearrangement. The interaction of all the elementary magnets together with temperature changes and mechanical shocks will tend to weaken a magnet. This loss is very considerable at first but finally an almost permanent state is reached. When used in electrical measuring instruments magnets are artificially aged by subjecting them to considerable changes of temperature and a series of mechanical shocks. It should be noted in this connection that the permanence of the magnet will be somewhat increased by joining its poles, when not in use, by a piece of soft iron. The induced magnetism at the ends of the iron helps to hold the poles of the small molecular magnets in position, and counteracts the tendency of these poles to demagnetize the bar.

Aside from the extended use of permanent magnets in electrical instruments their practicable application is comparatively limited. The electro-magnet is widely used where it is desired to cause a temporary force action at a distance from the operator, as for example in the telegraph, etc. Powerful electro-magnets are now frequently used to lift large masses of iron during manufacturing processes. It may

be noted in this connection that the lifting force of a magnetic piece of iron depends on the square of the number of lines per unit area at the contact face. Only so large an area should be used in contact as can be very highly magnetized by the current available. In the construction of dynamos, motors and transformers, the magnetic quality of the iron used is of great importance. The total number of lines set up (flux) must be sufficient for the operations involved and saturation should not be approached in any part. Where the cross section may be made large, cast iron can be used, but where the flux must be concentrated, special soft iron or steel is required. All air gaps are made as small as mechanical and electrical considerations of construction will permit, in order that the required flux may be more easily set up

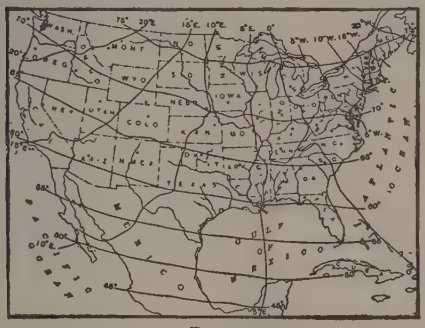

FIG. 9.

by the electro-magnets. Or as electrical engineers say, the magnetic "*reluctance*" is made small by use of properly proportioned iron parts and small air gaps in order that the *magneto-motive force* required may not be excessive.

Terrestrial Magnetism.— The statement usually made that a freely suspended magnet needle, remote from magnetic masses, tends to point north and south is not correct except for a few localities at certain times. The actual nature of the earth's magnetic field must be found by extended experiments which are being carried on by numerous observers largely under the direction of various governments. (See methods of magnetic measurements above). If a steel needle be suspended by a silk fibre and carefully balanced so as to hang horizontal and is then magnetized it will be observed to finally come to rest in a certain vertical plane and to be inclined to the horizontal. The angle between a horizontal line and the direction of the needle is called the dip, and the angle between the true north and south plane and that in which the needle lies is called the declination. The values of the dip, declination and intensity of the earth's field at a point are called the magnetic elements at that point. The use of the compass both by the surveyor and mariner over nearly the entire surface of the earth makes an accurate knowledge of these elements indispensable. In order to convey this information, in a practical way, recourse is had to maps on which places having the same declination, for example, are joined by lines. Such maps bring into view many interesting features as regards the earth's magnetism. For example, Fig. 9, published by the United States Coast and Geodetic Survey for 1900 shows that in northern Oregon, Idaho and Montana the compass pointed approximately 20 degrees east, while in the extreme northeastern part of Maine it pointed about 20 degrees west. Along an irregular line crossing Michigan, Ohio, North and South Carolina and passing east of Cuba the declination was 0, or the needle pointed due north. It is evident from an inspection of these maps that the poles of the earth considered as a magnet do not coincide with the geographic poles. The line of no dip follows the equator only approximately. North of this line the north end dips down, while at the south it is reversed. Some of the minor variations are no doubt caused by local causes, such as masses of magnetic material, but it is a general belief among observers that the earth's magnetism is largely due to outside agencies. Another very important point for the mariner, who depends on the compass to find his way in safety across trackless seas or the surveyor anxious to locate landmarks, is that these magnetic elements are continually changing even during the day, as well as month by month and year by year. In London during 232 years the declination changed 35 degrees. "A street one mile long laid out in London parallel to the compass direction in 1580 would have its terminus seven-tenths of a mile too far east according to the compass in 1812." Since 1812 the declination at London has changed from about 24 degrees west to 16 degrees west. In 1580 it was 11 degrees east. In fact it would seem that the magnetic poles of the earth are slowly vibrating. The periods of some of the components of this vibration are astronomical in origin — the day, the year, the lunar month, the sun-spot period, etc. The variation during the day must be taken into account in accurate work as a mile run in the morning and repeated in the afternoon may vary by 5 to 20 feet at its terminus. Sudden changes called magnetic storms also frequently occur, which seem to be associated with atmospheric electrical conditions, sun spots, etc. In order to secure data for the study of these complex phenomena, magnetic observatories are maintained where delicate instruments record, day and night, the countless fluctuations of the magnetic forces.

The problem of the navigator is still further complicated by the use of iron ships which are always sources of disturbance, both because of their permanent as well as their variable magnetism. The continual jarring and changes of temperature during a voyage enables the earth's field to continually change the distribution of magnetism in the vessel. The means to be used for the correction of this deviation have received the attention of many skilful investigators. The limits of this article will hardly allow a discussion of the matter which may be found in special books noted at the end.

The contrast between the state of knowledge regarding magnetism before 1600 and its present development is one of the most striking indications of the growth of scientific investigation. Instead of vague speculations, partial truths veiled in mysticism, more or less direct references to dogma and the supernatural, we have organized knowledge based on experience and constantly checked by experiment and ap-

plication. The number of those who believe in "magnetic" healing is constantly on the decrease. The relations between magnetism and other fields of physical research are constantly being investigated and no one believes the end is at hand. It may well be that the delicately poised magnetic needle in some future interpretation of its countless movements will give us a knowledge of the invisible yet all-pervading agency which governs its fluctuations and lead us to a broader generalization of physical phenomena than we can formulate at present. (See ELECTRICITY; ELECTROMAGNETISM.) For the optical effects of magnets in rotating the plane of polarization of light see POLARIZED LIGHTS.

JOHN S. SHEARER,
Late Assistant Professor of Physics, Cornell University.

MAGNETISM, Animal. See HYPNOSIS.

MAGNETITE, or **MAGNETIC IRON ORE,** native magnetic oxide of iron, Fe_3O_4. It sometimes has part of its iron replaced by titanium or magnesium, and occasionally by nickel. It is very abundant (the production of the United States in 1950 being 7,697,029 long tons, or over 7 per cent of the iron-ore production of the country). When pure it constitutes a valuable ore of iron, 72 per cent of its weight consisting of that metal. Magnetite crystallizes in the isometric system, commonly in octahedra, but also in dodecahedra, with striated faces. It also occurs, and very generally, in massive and granular forms. It is black in color, with a metallic or submetallic luster. It is brittle, and has a hardness of from 5.5 to 6.5; the crystals having a specific gravity of about 5.17. It may be readily distinguished by the fact that it is strongly magnetic. Specimens are found which manifest quite a strong, permanent magnetic polarity, this variety of the mineral being known as "lodestone." Magnetite occurs in vast beds in Canada and in the northern and eastern parts of the United States. Abundant deposits of it are also known in California and Washington. It is a common result of segregation in magmas during cooling. See IRON ORES; MAGNETIC SEGREGATION.

MAGNETO, a magnetoelectric machine, as a magneto alternator with permanent magnets, used to generate current for electric ignition in an internal-combustion engine (q.v.), and operated by the engine itself.

MAGNETOELECTRIC MACHINES. See ELECTROTHERAPEUTICS.

MAGNETOELECTRICITY. See ELECTROMAGNETISM.

MAGNETOMETER, in its customarily restricted sense, an instrument employed in observatories to determine the intensity of terrestrial magnetism. Essentially the instrument consists of a magnetic needle free to swing in a horizontal plane within a circular scale. The magnet may be supported on a fine vertical pivot, or by suspension on a fine untwisted silk thread. Bifilar suspension is more to be depended upon; the magnet is supported by two parallel threads and screws enable the tensions in the threads to be equalized and their distance asunder to be adjusted. For delicate readings the instrument has been highly refined, a mirror being attached to the magnet reflecting a beam of light upon a scale. To prevent possible oscillations due to air currents the magnet is closed within a box with glass sides, through which it may be observed. A tall tube above the box encloses the suspending thread. The unifilar magnetometer is set up with its magnet lying in the direction of the magnetic meridian. The bifilar instrument is set with the magnet at right angles to that meridian—a much more sensitive position. To fill the needs of traveling observers, portable magnetometers have been devised. These are more comprehensive, comprising within a single unit an astronomical telescope with a magnetometer—for the determination of both the magnetic declination and the horizontal intensity; and also a dip circle for the determination of inclination and total intensity. See MAGNETISM—*Terrestrial.*

Consult Joyce, J. W., *Manual on Geophysical Prospecting with the Magnetometer* (Washington 1948).

MAGNIFICAT. The words which Mary pronounced when she visited Elizabeth (Luke 1: 46–55) begin, *Magnificat anima mea dominum* (My soul doth magnify the Lord). Hence the whole of her thanksgiving on this occasion has been called the Magnificat. The present usage of the Roman Catholic Church is to chant or pronounce the Magnificat every day at vespers.

MAGNITOGORSK, măg-nē'tô-gôrsk, city of Soviet Russia, in the Chelyabinsk region in Asia, on the Ural River, 135 miles southwest of Chelyabinsk. Originally a small village of the steppe it underwent a tremendous development after the Soviet government began in 1929 the exploitation of the rich magnetic iron ore deposits of the near-by mountains and built huge plants for the production of iron and steel. Magnitogorsk soon became one of the Soviet leading metallurgical centers, with a steel mill which is one of the largest in the world. Heavy machinery is also manufactured. American engineers assisted in the preliminary planning of the city in 1929. Estimated population (1946) 200,000.

MAGNOLIA, măg-nōl'yà, town of Arkansas, the seat of Columbia County, 35 miles west of El Dorado, on the Louisiana and North West Railroad; altitude 312 feet. It lies in a farming region, rich in oil and gas deposits. Cotton ginning, gasoline refining, lumbering, and the production of cotton textiles, cottonseed oil, foundry products and soft drinks are the main industries. The Southern State College is located here. The town was settled in 1852 and was incorporated in 1855. Pop. (1950) 6,918.

MAGNOLIA, a genus of ornamental, deciduous or evergreen trees and shrubs of the family Magnoliaceae. The 35 species are natives

mostly of the United States, India, China and Japan. They are characterized by large, alternate entire leaves, large white, purple or pink, sometimes yellowish, solitary, terminal flowers, which are often highly fragrant; and cone-shaped, often red, decorative fruits. They are widely planted for ornament in parks and gardens; most of the deciduous species being tolerably hardy as far north as Massachusetts, some even farther north, but the evergreen kinds tender even at Washington, where, however, one species (*M. grandiflora*) can withstand the winters if in protected situations. The wood is close-grained, generally soft, spongy, light and satiny. It is little used because it is not durable, but in Japan one species (*M. hypoleuca*) is used for lacquering. The bark and the fruits of a few species were formerly employed as stimulants and tonics, but have fallen into disuse.

As a rule, magnolias thrive best in rather rich, fairly open, moist, peaty or sandy loams, but generally prove satisfactory upon any garden soil. A few, especially the beaver tree (*M. glauca*), which is also popularly known as sweet, swamp or white bay, are natives of very wet grounds and must be naturally well supplied with water, when planted for ornament. They may be propagated by means of layers, by grafts or by seeds planted as soon as ripe or stratified in sand and kept out of doors where they cannot become dry. The plants should be transplanted when the new growth is commencing, otherwise the operation is frequently unsuccessful.

The following species are among the most generally planted in the United States. The bull bay or big laurel (*M. grandiflora*) is found naturally from North Carolina to the Gulf States. It is a pyramidal, evergreen tree which often attains heights of 75 feet or more, and is especially conspicuous when in blossom, its fragrant white flowers often attaining a diameter of a foot. The swamp sassafras or sweet bay (*M. glauca*) ranges from the coast region of Massachusetts to Florida and irregularly southwestward to Texas. It reaches a height of 20 feet and bears fragrant cream-colored flowers. The cucumber trees (q.v.) are natives of the southeastern United States and are particularly attractive because of their pink fruits. Of the exotic species the yulan (*M. denudata*), a native of China, where it has been cultivated for more than a thousand years, and *M. coco, M. liliflora* and *M. hypoleuca* are popular, the first and last particularly. By crossing, hybridizing and selection a large number of choice horticultural varieties have been produced.

MAGOFFIN, mą-gŏf'ĭn, **Beriah,** American statesman: b. Harrodsburg, Ky., 18 April 1815; d. there, 28 Feb. 1885. He was graduated from Centre College (Danville, Ky.), in 1835, from the law school of Transylvania University (Lexington, Ky.) in 1838, entered the practice of law at Jackson, Miss., in 1839, but in the same year returned to Harrodsburg. In 1840 he became police judge, in 1848, 1856 and 1860 was a delegate to the Democratic national conventions, in 1850 was elected to the State senate of Kentucky and in 1859–62 was governor of Kentucky. He refused, 15 April 1861, to comply with Lincoln's call for 75,000 troops; in May 1861 by proclamation warned both the Confederate and Federal governments against occupying Kentucky soil, and the citizens of the State against entering hostilities; and in August requested Lincoln to withdraw United States troops. He vetoed a resolution of the legislature directing him to proclaim the evacuation of Kentucky by the Confederates; but the resolution was passed over his veto. In August 1862 he resigned his office and in 1867 was elected to the lower house of the State legislature.

MAGOG, mā'gŏg, Canada, town in Stanstead County in the province of Quebec, on Lake Memphremagog at its outlet, and on the Canadian Pacific Railroad, about 19 miles southwest of Sherbrooke. It has regular daily communications with Newport and other places in Vermont. Its industries include textile prints, lumber and butter and cheese making. Magog is a favorite resort for anglers. Pop. (1931) 6,302.

MAGOG. See Gog and Magog.

MAGOON, mă-goon, **Charles E.,** American lawyer and administrator: b. Steele County, Minn., 5 Dec. 1861; d. Washington, D. C., 14 Jan. 1920. He was educated at the University of Nebraska, was admitted to the bar in 1882 and engaged in the practice of law at Lincoln, Neb., in 1882–99. He was appointed judge-advocate of the Nebraska National Guard, with rank of major, and in 1899–1904 he was law officer of the Bureau of Insular Affairs at the War Office. He served as general counsel for the Isthmian Canal Commission in 1904–05, and was a member of the commission in 1905–06. He was governor of the Canal Zone from 25 May 1905 until 12 Oct 1906. He was also Envoy Extraordinary and Minister Plenipotentiary to Panama from 7 July 1905 until 12 Oct. 1906. He acted as provisional governor of Cuba from 12 Oct. 1906 until 28 Jan. 1909. Author of 'The Law of Civil Government Under Military Occupation' (1902).

MAGOT. See Barbary Ape; Macaque.

MAGPIE (originally *pie,* the pied or variegated bird, a bird of the genus *Pica,* closely related to the jays. The genus is distinguished by the extremely long wedge-shaped tail, the middle feathers of which equal the entire length of the head and body, while the outer feathers are less than half as long. The notorious magpie of Europe (*P. rustica*) is represented in North America by the variety *hudsonia,* which is rather larger but otherwise similar. The color is a lustrous black with a varied and changing iridescence and sharply contrasting white under parts and patches on the shoulders and wings, the latter being conspicuous as the bird flies. The yellow-billed magpie (*P. nuttalli*) of California is precisely similar except that the bill and a naked area at its base are yellow instead of black. Other species inhabit Asia and Africa. In America the common magpie is confined to the west, its range reaching from Alaska to Arizona and from the plains to the Cascade Mountains, being especially common in the Rocky Mountains. The magpie is a handsome bird of saucy, vivacious habits and is chiefly noted for its thieving habits and general rascality. It is always engaged in mischief, either in stealing brightly colored or glittering objects from the habitations of man or in robbing the nests of other birds, but because of its pert, merry manner is

usually forgiven for the former class of offenses. The caged birds seen in the East give but a faint idea of the beauty and activity of these birds in the wild state. Like the jays the magpies are omnivorous, but less strictly arboreal than the jays. The nest, which is built in a tree or bush, is very ingeniously and substantially constructed. It is a large domed structure protected outwardly by a thick, bristling layer of thorns and twigs, through which a narrow passage opening on one side leads to a deep cup plastered with mud and lined with fibres. Six to nine greenish drab eggs, much spotted and dashed with various shades of brown, are laid. The American magpie is occasionally taken young and made a pet, but it has not the reputation for talking and amusing, albeit thievish, manners, which has made the European bird a favorite from ancient times. Descriptions of its many interesting habits will be found in the books of Coues, Ridgway, Merriam, Cooper, Keyser and other writers upon the ornithology of the western United States.

MAGRATH, mą-grăth, **Andrew Gordon,** American Confederate governor: b. Charleston, S. C.; d. there, 9 April 1893. Magrath was the son of an Irish revolutionist of 1798 who escaped to South Carolina. He was educated at South Carolina College (1831) and at the Harvard Law School. He served two terms in the State legislature (1840–44), practised law in Charleston and in 1856 was made Federal district judge by President Pierce. In 1861 he resigned, was elected to the South Carolina convention which adopted the ordinance of secession and was then appointed Confederate judge. In December 1864 he became governor of South Carolina. After the war he was imprisoned for several months. He later resumed the practice of law in Charleston.

MAGRATH, William, American painter: b. Cork, Ireland, 20 March 1838. He emigrated to the United States in 1855, and was elected National Academician in 1876. He produced many excellent landscapes and his genre pictures are full of character. Among them may be mentioned 'The Road to Kenmair' (1871); 'The Reveillé' (1873); 'Rustic Courtship' (1877); 'On the Old Sod' (1879), which last is in the New York Metropolitan Museum; 'Paddy on his own Land' (1900); 'Sheep Pasture' (1903); 'The Killarney Country' (1910); 'The Bog of Allen, Ireland' (1911); 'Bog Lands' (1913). Deceased.

MAGRUDER, mą-groo'dẽr, **John Bankhead,** American soldier: b. Winchester, Va., 15 Aug. 1810; d. Houston, Tex., 19 Feb. 1871. He was graduated at West Point in 1830, served for a short time in the 7th Infantry, then in the artillery. In 1836 he was made first lieutenant, saw service in the Seminole War 1837–38 and became captain in 1846. He took an active part in the Mexican War, rising to the rank of lieutenant-colonel, 1847. In 1861, while in garrison at Washington, D. C., he resigned from the United States army, accepted a Confederate colonelcy and commanded the artillery at Richmond. In the same year he won the battle of Big Bethel (q.v.), and was made brigadier-general and major-general. Assigned to the Yorktown district, he fortified the Peninsula and with a force of 12,000 held it against the Army of the Potomac in April 1862. In the Seven Days' Battles (q.v.) he commanded the Confederate left. In October 1862 he was appointed commander of the Department of Texas. He recaptured Galveston 1 Jan. 1863, and broke the blockade of that port. After the war he served as major-general in the army of Maximilian in Mexico until the end of the empire, but finally in 1869 he settled at Houston for the rest of his life.

MAGRUDER, Julia, American novelist: b. Charlottesville, Va., 14 Sept. 1854; d. Richmond, Va., 9 June 1907. Her literary career began in 1885 with 'Across the Chasm,' published anonymously. She wrote 'A Magnificent Plebeian'; 'The Violet'; 'Miss Ayr of Virginia'; 'A Manifest Destiny'; 'Princess Sonia' (1895), etc.

MAGUAGA, Battle of. See DETROIT, SIEGE AND CAPTURE OF.

MAGUINDANAO, mä-gēn-dä'now, a tribe of Moros who inhabit the valley of the Rio Palangui, island of Mindanao; the Moros of the Sarangani Islands, and some of those of Davao Bay belong also to this group. See PHILIPPINE ISLANDS.

MAGYAR MUSIC. See HUNGARY, *Music.*

MAGYARS, mŏ'gyŏrz, the original name of the Hungarians, which they still use in preference to any other. See HUNGARY.

MAHA-KAŚYAPA, mä hä' käsh'yä pä, **Kassappa,** one of Buddha's first converts and one of his 80 great disciples who was favored by Buddha as his successor. After the death of Buddha he seems to have taken an active part in the work of organizing and propagating the faith. It was at his instance that the first Buddhist council of a general nature assembled. He gave considerable attention, according to tradition, to the organization and arrangement of the canonical books of the Buddhist faith. Playing such a prominent part at the dawn of the Buddhist religion, and being the beloved and trusted disciple of the master and, in a sense, his successor, it is natural that he should enter largely into the legendary and traditional religious lore of the Buddhists, as he does, in fact. Consult Bournouf, 'Indroduction à l'histoire du buddhisme indien' (Paris 1844); 'Le lotus de la bonne loi' (Paris 1852); Kern, 'Manual of Hindu Buddhism' (Strassburg 1896); Rhys, Davids, 'Buddhism' (London 1890).

MAHÂBHÂRATA. The name of this, the great national epic of the Hindûs, etymologically considered, consists of the word «mahâ,» meaning «great,» «mighty,» and «bhârata,» one of the several names of a powerful Indian tribe, but has reference more to the story itself, about «the great tale of the Bhâratas.» In the shape in which the Mahâbhârata has come down to us it is enormous in bulk, comprising some 100,000 *çloka* (couplets), and as its author is cited one Vyâsa. But the word «vyâsa» stands for «reviser,» «collector,» «editor,» and this alone, irrespective of the fact that no description, no biographical detail of this Vyâsa has existed, seems clearly to prove that the Mahâbhârata represents a gradual growth and gathering of poetic material finally given a collective name and figuring as an entity. In the poem itself the number of *çlokas* (distichs) is given at 24,000, while there is

rather strong literary proof that the original core was even much smaller than that, namely, counting but 7,000 *ślokas*. The total of the colossal remainder represents accretions and superimpositions that were at last included in the whole — many episodes, much legendary lore, lengthy and detailed ethical precepts, such as those addressed to the Kshatrias, the warrior caste, to guide their behavior to the other castes, and other material. Already in the 4th century A.D. the 'Mahâbhârata' was popularly held in the light of a code of laws as well; it was not alone the 'Iliad' and 'Odyssey' of the Hindû people combined, which youth studied and recited and learned by heart, but also a compendium of morals read aloud by the priests in the temples and shrines, at least fragments and selections from it. Thus we do know that the 'Mahâbhârata' is a work of great antiquity; but the exact period of its birth, the whole story of its genesis, we cannot even guess. It is certain, however, that the kernel of the epic, describing the war between the Kurûs (or Bhâratas) and the Pândavas, must have antedated the time of Kalidâsa by many centuries. The archaic language shows that. This simple tale gives us as heroes Duryôdhana, son of blind King Dhirtarâshtra, Drôna, Kama, Çalya among the Kurûs, and among the Pândavas the five sons of Pându, Ardjuna, Judishthira, Bhîma, and the Vishnuic incarnation, their wise counselor, Krishna, the ruler of Yâdava, the «spinner of all ruses and deceptions.» The circumstance that the five Pândava brothers have jointly but one wife, Drâupadî, and the fact that the caste, marriage and inheritance customs, as exemplified in the poem, are in strong contrast with later practices, of itself bespeaks great antiquity of this, the core of the epic. Brahmanism had not yet crystallized when it originated. At very different periods extraneous matter has been interpolated and amalgamated with this primary portion of the Mahâbhârata. In fact, all that ran riot in the earlier Hindû mind in the shape of folklore, legend and myth was, one after the other, added to the first text and gradually coalesced with it. Hence, too, the enormous size of this lay as we have it now. But even as it is, the Mahâbhârata is by no means a unit accepted by all. We see it subdivided in the north of India into 18 books (*Parvans*), sometimes including the 19th, the Harivamça; in the south it exists in 24 books, and the various chapters differ materially in sundry versions, both in text and size. The most comprehensive and enlightening critical work in this line has been done by the Danish philologist, Söre Sörensen, in his compendium on Hindû literature (Copenhagen 1843). A careful examination of the whole text unavoidably betrays the mixed origin of the Mahâbhârata, shows plainly the earmarks of having been worked over, revamped, added to, and that numberless scribes have probably been busy at this task for a period exceeding 10 or 12 centuries. The composite character of the poem is also shown by the different metres, contents and spirit. By some scholars, such as Hopkins and Dahlmann, the conclusion has been reached that there were earlier portions of the epic than now remain; perhaps, as Grierson holds, describing an initial struggle for the possession of northern India between the Aryan settlers and their foes. As it stands at present the poem — meaning its oldest core — is somewhat puerile, since it starts with an account of a gambling match, at which the Kurûs cheated the Pandûs, robbed them of the kingdom, and exiled them for 12 years. While spending this exile in the forests and groves, tales are told to while away the dreary hours. When the exile draws to a close the Kurûs are utterly routed during an 18 days' battle. This story furnishes the backbone; it is crude and in a literary sense sadly deficient, but it doubtless derives from the hoary past. The 20,000 stanzas of rules and instructions to the warrior caste are jumbled, often contradictory. From an artistic point of view the best parts of the whole are episodes like that of Damayânti and Nâla, of Savîtri, etc., which have been successfully dramatized. Like all of Hindû literature, even the best, there is a palpable lack of proportion. But there are eminently strong passages, scattered here and there in the whole and showing pathos, tenderness, descriptive powers. The student may be referred to a good summary of the poem, 'Mahâbhârata, the Epic of Ancient India,' condensed into English verse by Romesh Dutt (London 1898), to 'Geschichte der indischen Literatur' (Leipzig 1908), by M. Winternitz; to 'Das Mahâbhârata' (Kiel 1892–95), by Adolf Holtzmann; or to the English translation of the original work by a Hindû scholar, Protap Chandra Roy (Calcutta 1883).

WOLF VON SCHIERBRAND.

MAHADEVA, mą-hă-dā'vą, in Hindû mythology, a deity who shares the attributes of Siva in the Indian Trinity, Mahadeva being regarded as a generator as well as a destroyer.

MAHAFFY, mą-hăf'ĭ, **John Pentland,** Irish Greek scholar: b. Chapponaire, near Vevay, Lake Geneva, Switzerland, 12 July 1839; d. Dublin, Ireland, 1 May 1919. He was educated in Germany and at Trinity College, Dublin, from which he was graduated in 1859; and became professor of ancient history in the college in 1871. In 1873 he was Donnellan lecturer. His first publication was a translation of Kuno Fischer's 'Commentary on Kant' (1866); and on philosophical subjects he afterward issued several volumes. The greater number of his works, however, treat of the history, literature and everyday life of ancient Greece, among these being the following: 'Prolegomena to Ancient History' (1871); 'Greek Social Life from Homer to Menander' (1874); 'Greek Antiquities' (1876), a work much used in Continental schools; 'Rambles and Studies in Greece,' a record of antiquarian research (1876); 'Old Greek Education' (1879); 'History of Classical Greek Literature' (1880; 3d ed., 1891); 'Greek Life and Thought from Alexander to the Roman Conquest' (1887), a continuation of the work of 1874; 'The Greek World under Roman Sway' (1890), a continuation of the preceding; 'The Story of Alexander's Empire' (1890); 'Greek Pictures' (1890); and 'Problems in Greek History' (1892); 'The Progress of Hellenism in Alexander's Empire' (1905); 'The Silver Age of the Greek World' (1906); 'What have the Greeks done for Modern Civilization?' (1909). He wrote with special interest and authority of the post-Alexandrian period; and discovered interesting parallels between that and modern civilization. Among

his other writings are 'Twelve Lectures on Primitive Civilization' (1868); 'Report on the Irish Grammar Schools' (1880–81); 'The Decay of Modern Preaching' (1882), and 'The Art of Conversation' (1889); 'An Epoch in Irish History' (1904).

MAHALEB, a kind of European cherry (*Cerasus mahaleb*), whose fruit affords a violet dye and a fermented liquor. Its flowers and leaves are used by perfumers, and its wood by cabinet-makers. See CHERRY.

MAHAN, mą-hăn', **Alfred Thayer,** American naval officer: b. West Point, N. Y., 27 Sept. 1840; d. 1 Dec. 1914. He was graduated from the United States Naval Academy in 1859, and served during the Civil War, rising to the rank of lieutenant-commander in 1865. In 1885 he was promoted captain, and in 1886 was appointed president of the Naval War College at Newport, a position which he held till 1888, and again 1892–93. In 1893–95 he was commander of the *Chicago,* and in 1896 was retired after 41 years' active service at his own request. In 1898 during the war with Spain he was a member of the Naval Board of Strategy; and in 1899 one of the United States delegates to The Hague Peace Conference. In 1906 he was advanced to the rank of rear-admiral on the retired list. In 1890 he published his chief work, 'Influence of Sea Power upon History'; the continuation, 'Influence of Sea Power upon the French Revolution and Empire,' appeared in 1892; his other writings include 'The Gulf and Inland Waters' (1883); 'Life of Admiral Farragut' (1892); 'Life of Nelson' (1897), highly commended by English critics; 'The Interest of America in Sea Power' (1897), a compilation of his magazine articles; 'Lessons of the War with Spain' (1899); 'The Problem of Asia' (1900); 'The South African War' (1900); 'Types of Naval Officers' (1901); 'Retrospect and Prospect' (1902); 'Seapower in its Relations to the War of 1812' (1905); 'Some Neglected Aspects of War' (1907); 'From Sail to Steam' (1907); 'Naval Administration and Warfare' (1908); 'The Harvest Within' (1909); 'The Interest of America in International Conditions' (1910); 'Armaments and Arbitration' (1912); 'Major Operations of the Navies in the War of American Independence' (1913).

As a historian he made a distinct contribution to historical science as the first writer to demonstrate the determining force which maritime strength has exercised upon the fortunes of individual nations, and consequently upon the course of general history. Technically, his representative work, the 'Influence of Sea Power upon History,' is but a naval history of Europe from the restoration of the Stuarts to the end of the American Revolution. But the freedom with which it digresses on general questions of naval policy and strategy, the attention it pays to the relation of cause and effect between maritime events and international politics, and the author's literary method of treatment, place this work outside the class of strictly professional writings and make it a recognized leading authority. His prime object, in establishing the thesis that maritime strength is a determining factor in the prosperity of nations, was to reinforce his argument that the future interests of the United States require a departure from the traditional American policy of neglect of naval-military affairs. Captain Mahan was president of the American Historical Association in 1902–03; and received honorary degrees from several universities, including D.C.L. from Oxford and LL.D. from Cambridge (England), Harvard, Yale, Columbia and McGill universities.

MAHAN, Asa, American Congregational clergyman and educator: b. Vernon, N. Y., 9 Nov. 1800; d. Eastbourne, Sussex, England, 4 April 1889. He was educated at Hamilton College, Clinton, N. Y., and Andover Theological Seminary, and after holding pastorates at Pittsford, N. Y., and Cincinnati, Ohio, was president of Oberlin College 1838–50; and also professor of philosophy there. He was president of Cleveland University 1850–56; and of Adrian College, Michigan, 1860–71. After the last-named date he lived mainly in England. Among his works were 'Doctrine of Christian Perfection' (1839); 'System of Intellectual Philosophy' (1845); 'The Will' (1846); 'Science of Logic' (1857); 'Mental Philosophy' (1882); 'History of Philosophy' (1883).

MAHAN, Dennis Hart, American military engineer: b. New York City, 2 April 1802; d. near Stony Point, N. Y., 16 Sept. 1871. He was graduated at West Point in 1824, where in 1825 he was appointed assistant professor of mathematics and of engineering. He was stationed in Europe four years on professional duty and in 1832 returned to West Point as professor of military engineering, where he remained until his suicide, which was caused by temporary insanity. His textbooks are generally recognized authorities and include 'Treatise on Field Fortifications' (1836); 'Descriptive Geometry' (1864); 'Military Engineering' (1865); 'Permanent Fortifications' (1867); 'An Elementary Course of Civil Engineering' (1837, rewritten 1868), etc. Consult Abbot, H. L., 'in Biographical Memoirs of the National Academy of Sciences' (Vol. II, Washington 1886).

MAHAN, Milo, American Protestant Episcopal clergyman, brother of Dennis Hart Mahan (q.v.): b. Suffolk, Va., 24 May 1819; d. Baltimore, Md., 3 Sept. 1870. He was educated at Saint Paul's College, Flushing, L. I., and in 1845 was ordained in the Protestant Episcopal Church. He was called to the charge of Grace Church, Jersey City, N. J., in 1848, and became assistant at Saint Mark's, Philadelphia, in 1850. In 1857–64 he was professor of ecclesiastical history at the General Theological Seminary, New York. He became rector at Saint Paul's, Baltimore, Md., in 1864 and spent the remainder of his life there. Author of 'The Exercise of Faith' (1851); 'History of the Church During the First Three Centuries' (1860; enlarged to cover seven centuries, 1872); 'Palmoni, a Free Inquiry' (1864); 'The Comedy of Canonization' (1868); 'Collected Works' (3 vols., 1872–75).

MAHANADI, mä-hä-nŭd'ĭ, or **MAHANUDDY** ("The Great River"), a river in British India. In the upper part of its course it drains the fertile plain of Chhattisgarh in the Central Provinces; flows southeast and then east through the province of Orissa, past Sambalpur and Cuttack, into the Bay of Bengal by two mouths, after a course of about 530 miles.

During the rains it is navigable 30 miles from its estuary, but a large portion of its channel is dry during five or six months of the year, and since the opening of the Bengal and Nagpur Railroad it has been little used for navigation. It is estimated that the Mahanadi drains an area of nearly 44,000 square miles, and during the rainy season about 1,500,000 cubic feet of water passes every second through the Maraj gorge, which amount decreases in dry weather to 1,125 cubic feet. An extensive system of irrigation canals is connected with it. Diamonds are found in this river and in several of its tributaries.

MAHANOY (mä-hạ-noi') CITY, Pa., a borough in Schuylkill County; alt. 1,230 feet; 18m. SW. of Hazleton; on the Lehigh Valley, and the Reading railroads. It is situated in the anthracite coal mining region of the Mahanoy Valley; mining was begun here in the early 1860's. The borough's principal industrial products are shirts, hosiery, and other apparel; cigars, and beer. First settlement, by Emanuel Boyer, tavernkeeper, was in 1853; incorporation as a borough, 1863. The name is a Delaware Indian word meaning deer lick; it was originally applied to the creek. Government is by burgess and council. Pop. (1930) 14,784; (1940) 13,442.

MAHARAJAH, mạ-hä-rä'jạ, a title used in India; applied in courtesy to every rajah, or to any person of high rank or deemed holy.

MAHASEER, mä'hạ-sēr, a large and ravenous barbel (*Barbustor*) of India, which reaches six feet in length and in the early part of the rainy season afford the best sport known to the anglers of India and Ceylon, as they take a fly readily, and struggle with the gameness and energy of a salmon to get free, pleasantly taxing the skill of the angler to bring them to land without breaking rod and line. They spawn at the heads of the hill-rivers, and then descend before the young are hatched. The fry then have an opportunity to grow in comparative safety to a size which enables them, the following season, to descend the rivers and take care of themselves; otherwise they would be devoured in infancy by their elders.

MAHATMA, a Hindu word meaning "the great-souled one," and applied among the Brahmans to one who has attained the highest possible point of spiritual enlightenment. It is also the name of a high priest or "wise leader" of the theosophists

MAHĀYĀNA ("The Great Vehicle"), the name of one of the principal divisions of Buddhism (q.v.). It originated in northern India about the beginning of the Christian era through a gradual synthesis of tendencies already manifest in earlier Buddhism, possibly with some admixture of ideas from the West.

In its philosophy the Mahāyāna goes beyond primitive Buddhism's denial of the real existence of a soul or ego, and maintains the doctrine of the utter unreality of all experience. This is expressed in the formula "everything is void," which is interpreted by the Madhyamaka, or sceptical, school as meaning that it is impossible either to affirm or to deny anything concerning reality, whereas the Vijnānavādins, or idealists, declare "the void" to be pure thought, without distinction of subject or object. Both schools admit that the illusion of the phenomenal world is invincible for even the wisest man, and that only the Buddhas are perfectly free from it, so that the practical validity of experience is not impaired.

The idea of the Buddha, or "Enlightened One," has received a great extension in the Mahāyāna, and the human traits of the historic Gautama have been lost in the radiance of divinity. There are countless Buddhas throughout the worlds, and they manifest themselves through infinite periods of time in the various heavens, as well as by appearing on earth in the guise of human teachers. In their function of enlightening all creatures they are aided by the celestial Bodhisattvas, or Buddhas-to-be, who are more actively beneficent. Among the Buddhas the most worshiped is Amitābha, "He of Boundless Light," the ruler of the Western Paradise called Sukhāvatī, "Happy Land." This deity, who is quite unknown in the earlier Buddhism, is presumably of solar origin. The merciful Avalokiteśvara and Manjuśrī, the fount of wisdom, are especially prominent Bodhisattvas. The belief in female Bodhisattvas, such as Tārā and the Chinese Kwan-yin, is a later development, as is also the notion of a "primordial Buddha," or First Cause. All this luxuriant polytheism is harmonized with the doctrine of "the void" through the belief that a Buddha has three "bodies" or modes of being, the "body of the Law," identical with the void, the "body of bliss," an appearance manifested to the celestial beings, and the "body of fabrication," the illusory form of an earthly Buddha such as Gautama.

The Mahāyānist belief in the powerful and merciful Buddhas and Bodhisattvas is accompanied by a new conception of the religious life. Instead of the older self-centred system of monastic discipline, by which the individual was to obtain final deliverance, Nirvāna, at the close of his present existence, the Mahāyānists made it their goal to become Buddhas themselves, after practising all the virtues through numberless existences, for the sake of the salvation of all beings. Everyone who consecrates himself to this aspiration is a Bodhisattva, or potential Buddha, although he will not attain the rank of a celestial Bodhisattva until toward the last of the 10 stages in his career. Self-sacrifice, rather than self-restraint, is therefore the keynote of the ethics of the Mahāyāna, and though the institution of monasticism is preserved, the discipline is relaxed, and laymen also may follow the career of a Bodhisattva. Prayer and confession of sins to the Buddhas are commanded, and forgiveness is believed to be secured through their superabundant merits.

The broadly human quality of the Mahāyāna religion involved a certain sacrifice of the distinctive features of Buddhism, and its later development, particularly in the form of the Tantra (q.v.) system, shows a gradual approximation to the contemporary Hinduism. Hence in India the Mahāyāna ultimately gave way to the Vedānta philosophy and the popular religions of Vishnu and Siva; but it still survives in the countries to the north and east, whither it had been carried by missionary activity. In Tibet and Mongolia it has assumed the form of Lamaism (q.v.), while in China and Japan it shows more of its primitive character, although

in the latter country especially it has split into numerous sects, some of which hold a decidedly theistic belief.

MAHDI, mä-dē′ (Arab. he who is guided in the right path). The title of a coming messiah of the Moslems who will establish the reign of justice on earth. The mahdi must be a descendant of the prophet; he must be proclaimed mahdi against his will at Mecca at a time when there is strife after the death of a caliph; and his advent shall coincide with that of Antichrist, after whom Jesus will descend in Syria and the reign of righteousness be inaugurated. This is the orthodox view, but in Iran and Asia Minor there have been many pretenders to the title from the time of the first generation after Mohammed. According to the Shi'ite sect, the mahdi has already appeared in the person of the 12th imam, who disappeared about 874 and is concealed in some secret place until the end of the world. The most notable of recent mahdis was the Sudanese sheik Mohammed Ahmed (1843?–1885). During 1880–1884 he proclaimed a mission to free Egypt from the foreign yoke and acquired an ascendancy over the Sudanese peoples. Gen. Charles George Gordon, sent to withdraw the British garrisons, was shut up in Khartoum, besieged by Mohammed Ahmed, and killed. The latter died in the same year, and his tomb was destroyed in 1898.

MAHE, mä-ā′, island in the Indian Ocean, largest of the Seychelles group, 600 miles northeast of the northernmost point of Madagascar. It has a length of 17 miles and breadth of 4 to 7 miles, the area being 55 square miles. Much of the island is mountainous, in most places the hills rising nearly perpendicularly from the sea; the highest point has an elevation of 2,993 feet. Victoria, capital of the British colony of Seychelles and its chief seaport, is located on the northeast coast of the island. Mahé was named for Mahé de la Bourdonnais, governor of Mauritius in 1742, when the island was annexed to France; the British took possession in 1794. Pop. (est.) 22,000. See also SEYCHELLES.

MAHE, settlement, French India, formerly known as MAYYALI. It is located on the Malabar coast 40 miles north of Calicut, and is the only possession of France on the west coast of India. The area is 23 square miles. The town of Mahé, at the mouth of a river of the same name, has no trade or industry of importance. First occupied by the French in 1725, the settlement was seized by Great Britain on several occasions prior to 1817, when it was restored to France. The Union of India renewed in 1952 its demand that Mahé be ceded to it. Pop. (1948) 18,293.

MAHICAN, mä-hē′kăn (meaning wolf), an Algonquin tribe of American Indians formerly occupying the Hudson River valley. They were closely related to the Delawares and the Mohegans, the collective tribes being known as the *Loup* or Wolf Indians. At one time there was a settlement of 40 villages near the site of the present city of Albany, N. Y. The assaults of the Iroquois and the white settlers diminished the tribe until the remnants of the race became merged with the Delawares. In 1736 those who still remained in Massachusetts, whither they had removed some years before, came together as a unit at Stockbridge and assumed the name of Stockbridge Indians. Later they removed to New York. See also MOHEGAN INDIANS.

MAHJONG, mä′jŏng′, or **MAH-JONGG.** The Chinese game known as mahjong is played with dominoes made of ivory and bamboo. There are usually four players at a table, each one acting for himself, as there are no partners. The dominoes, which number 136, are arranged in three suits, and there are four sets of each. One consists of three honors, red, white, and green; another represents the four winds, north, south, east, and west. The third is more elaborate, consisting of three sets of nine dominoes which are named characters, circles, and bamboos. The object of each player is to obtain the highest scoring hand.

MAHLER, mä′lĕr, **Gustav,** Austrian composer and conductor: b. Kalischt, Bohemia, July 7, 1860; d. Vienna, May 18, 1911. From 1897 to 1907 he was director of the Imperial Opera, in Vienna, and thereafter he conducted in the United States for three seasons, notably at the Metropolitan Opera House, New York City, and with the New York Philharmonic. Besides ten symphonies, he composed two operas, many songs, and much chamber music.

MAHMUD I, mä-mōōd′, sultan of Turkey: b. Constantinople, 1696; d. 1754. The son of Mustafa II, in 1730 he succeeded his uncle, Ahmed III, on the throne. He continued the war against Persia until 1736, when peace was made, and shortly became involved in war with Russia and Austria; Turkey recovered Belgrade by the treaty concluded in that city in 1739. His brother succeeded him as Osman III.

MAHMUD II, sultan of Turkey: b. July 20, 1785; d. July 1, 1839. The son of Abdul-Hamid I, in 1808 he ascended the throne in succession to Mustafa IV, his brother, who had been deposed and assassinated. He carried on war against Russia from 1809 until 1812 when, by the Treaty of Bucharest, Moldavia and most of Wallachia were restored to the Ottoman government. In 1814 he quelled a Serbian revolt, and from 1821 to 1829 he attempted to suppress the Greeks in their struggle for freedom; France, Britain, and Russia went to the aid of the Greeks, and in 1829 he was compelled to conclude the Treaty of Adrianople, recognizing Greek independence. He became involved in war with Mehemet Ali (Mohammed Ali), his viceroy in Egypt, in 1831, when the latter despatched Ibrahim to conquer Syria; it was only with Russian aid that the Egyptians were stopped in 1833. A second rebellion of Mehemet Ali, in 1839, was followed by a defeat of the Turks at Nizib shortly before the sultan's death. His successor was his son, Abdul-Medjid I (Abdul Mejid).

MAHMUD OF GHAZNI, mä-mōōd′, gŭz′nē, Moslem sultan of Ghazni, southwestern Asia: b. Oct. 2, 971; d. 1031. He was the son of Subuktigin, who founded the Ghaznevid dynasty in 977 at Ghazni, in central Afghanistan 92 miles southwest of Kabul. Succeeding his father in 997, he extended a relatively small Afghan kingdom as far as Iraq and the Caspian, and in the course of 17 invasions of India from 1001 onward he penetrated as far as the Ganges and central Gujarat (Guzerat). His earlier expeditions into India

were directed against successive rajas of Lahore. In 1005 he seized Multan (Mooltan), and in 1010, after subduing Ghor (Ghur), in the Hindu Kush, he resumed his conquests in India. For a time these were interrupted by his conquest of Transoxiana, effected in 1016. At the head of a large army, he invaded India once more in 1018, and the next year plundered Mathura (Muttra) and captured Kannauj (Kanauj). In his famous campaign of 1024 he invaded Gujarat and sacked the great temple at Somnath (Patan Somnath), the magnificence of which filled him with awe. He is said to have carried off immense treasures in diamonds and precious stones and to have sent to Ghazni the famous "Gates of Somnath" (later recovered and deposited in the arsenal at Agra). During 1026 he ravaged the Punjab, which became an outlying province of his kingdom, and in 1029 he led an expedition into Persia. *Shah Namah* (1010), the great epic poem of Firdausi (q.v.), was dedicated to Mahmud of Ghazni, who gave him but a meager reward.

MAHMUD SHEVKET PASHA, mä-mo͞od' shĕf-kĕt' pä-shä', Turkish army officer and statesman: b. Baghdad, 1855 or 1858; d. Constantinople, June 11, 1913. At the age of 24 he came under the influence of Baron Kolmar von der Goltz, the German general reorganizing the Turkish Army, who sent him to purchase war material in Germany and France. After 10 years' sojourn in western Europe he returned home with advanced ideas. He joined the Young Turk cause in 1908, and the next year he commanded a force which marched from Salonika, headquarters of the movement, to Constantinople and effected the deposition of Sultan Abdul-Hamid II. In 1912, during the First Balkan War, he was appointed minister of war, and in 1913, as grand vizier (premier), he was forced to conclude a disastrous peace. In the midst of attempts to settle differences with Great Britain and France, he was assassinated by political opponents while motoring to the sultan's palace.

MAHOE, mä-hō', name of an important fiber plant, *Hibiscus tiliaceus* or linden hibiscus, lemon hibiscus, or corkwood, a member of the mallow family. It is a handsome woody shrub or small tree with large lemon-yellow flowers and entire broadly cordate leaves like linden. Low banks of tidal rivers is its favorite habitat and it is widely distributed over tropical America, Polynesia, and the shores of the Indian Ocean. In some of the Pacific islands it grows spontaneously in large areas which have been abandoned after previous cultivation. The bark contains a strong flexible fiber used for many purposes, especially by the aborigines who also used the wood for making fire in the primitive fashion. The dark green heart wood is very tough and durable. The plant has remarkable properties of renewing fertility of soil which has been exhausted by crops. The mahoe is considered indigenous to America, and apparently on account of its useful character it was distributed widely over the islands and shores of the Pacific and Indian oceans before the arrival of Europeans. The etymology of its names in various regions gives some important clues as to the history of its distribution.

MAHOGANY. A popular name for the timber of several unrelated trees, among which are various species of eucalyptus (q.v.), natives of Australia, and members of the family Myrtaceae; two species of *Cercocarpus,* of the family Rosaceae, *C. montanus* being known as valley mahogany and *C. ledifolius* as mountain mahogany in the Rocky Mountain region where they are native and are mainly used for fuel. African mahogany (*Khya senegalensis*), East Indian mahogany (*Soymida febrifuga*), and *Cedrela toona,* an East Indian tree equally well known also as the toona, all belong to the family Meliaceae, but are less important timber trees than the true mahogany (*Swietenia mahagoni*) of the same family. This species is a native of tropical America, occasional small specimens being found in extreme southern Florida. It was formerly abundant in the West Indies, attaining heights of 150 feet or more in Jamaica, but on account of the demand it is now scarce. Cuba and Hispaniola formerly supplied the choicest, and Honduras the low grades; now practically all comes from Central America. The wood is generally some shade of brown, fine grained, easily polished, and durable except under lateral strain. It is highly valued for furniture, musical instruments, interior house-finishing, and the like, and is one of the most popular woods of the world. Formerly it was used for shipbuilding but now very little. The tree, which sometimes attains heights exceeding 100 feet, and diameters of six feet, has abruptly pinnate leaves with usually four pairs of leaflets, and small white or yellowish flowers in axillary or nearly terminal panicles. As an ornamental tree it is planted in southern Florida and southern California in rich soil. A few other related species of this genus are occasionally found in commerce.

MAHOMET. See MOHAMMED.

MAHON, mä-ôn', or **PORT MAHON,** seaport, Spain, in the Balearic Islands (Baleares Province), capital of the island of Menorca (Minorca). It is situated on the east coast, at the head of a bay which forms one of the best harbors on the Mediterranean. The town contains a handsome church, consistorial palace, theatre, museum, and library. There is a brisk coasting trade in the exports of Menorca, primarily brandy, wine, dried fruits, and agricultural products; grains, manufactured goods, coffee, sugar, and tobacco are imported. Mahon is believed to have been founded by the Carthaginian general Mago, whence its ancient name of Portus Magonis. The Moors occupied it from the 8th to the 13th centuries, and in 1535 it was pillaged by Barbarossa II. The seaport was occupied by the English from 1708 until 1756, when it was taken from them by the French after a memorable siege. It was restored to the English in 1763; and in 1783 it was awarded to Spain by the treaty terminating the War of American Independence. Pop. (1941 est.) 17,459.

MAHONE, mä-hōn', **William,** American Confederate officer: b. Southampton County, Va., Dec. 1, 1826; d. Washington, D.C., Oct. 8, 1895. After graduating at the Virginia Military Institute in 1847 he became a civil engineer. During the American Civil War he fought for the Confederacy, serving at the battles of Malvern Hill, Second Manassas, and the Wilderness, and becoming brigadier general in 1864. The war over, he became president of the Norfolk and Tennessee Railroad and was a principal organizer (about

1878) and leader of the Readjusters (q.v.), chiefly a faction of the Democratic party in Virginia who favored the forcible readjustment of the State debt on terms involving conditional or partial repudiation. Mainly by the supporters of this movement, he was elected in 1880 to the United States Senate, where, however, he acted with the Republicans, making the vote of the Senate a tie and disappointing the Democrats of their expected majority. By this and other acts of his senatorial career he lost favor with his constituents and was not re-elected.

MAHONY, mäh'ō-nĭ, **Francis Sylvester,** Father Prout,» Irish author: b. Cork 1804; d. Paris, 1866. Educated at a Jesuit seminary at Amiens, he studied theology at Paris, was admitted into the Order of the Jesuits and taught for some time in a Jesuit college in Ireland, but for some irregularities was deprived of the position of a member of the order. He received clerical ordination and officiated for a short time at Cork and in London, but soon adopted the profession of literature. In 1834–36 he contributed the 'Prout Papers' to *Fraser's Magazine,* published as the 'Reliques of Father Prout' in 1836. In 1846 he became Rome correspondent to the London *Daily News,* his letters being afterward republished as 'Facts and Figures from Italy' (1847). In his later years he was Paris correspondent for the *Globe.* The 'Reliques of Father Prout' in a revised and enlarged form were published in 1860, and 'Final Reliques' in 1876. In 1881 Charles Kent published a collective edition with a memoir. He will be longest remembered by his poem 'The Bells of Shandon.'

MAHRATTAS, mą-răt'ąz, a native Hindu race, supposed to be descendants of the Persians, and occupying a large tract of central and western India. They have always been a distinct nation or people, and still consider themselves as such, even though now largely under British or Mohammedan jurisdiction. They came into prominence about the middle of the 17th century, when the chief, Sevaji extended his conquests in various directions, had himself crowned king in 1674 and established the Mahratta Empire. After his death long minorities and the incompetency of the sovereigns caused the powers of the state to fall into the hands of the *Peshwa* or Prime Minister, who became the acknowledged head of a Mahratta confederacy. The first trouble with the British broke out in 1775 and was not settled until 1782. This happened during the administration of Warren Hastings (q.v.). The next outbreak came in 1803–05 and resulted not only in the acquisition of territory by the British but also in strengthening their power. Meanwhile the confederacy had held together till 1795, but internal wars and disturbances reduced the *Peshwa* to the position of a British dependent, and Scindia, Holkar and the Rajah of Berar were able to take the position of independent sovereigns. The confederacy came to a final end in 1818, after the third collision wherein the Peshwa himself took up arms against the British, and Scindia, Holkar, the Guicowar of Baroda, and the Rajah of Kolapore became dependent princes under British protection. The state of Gwalior came under British control in 1844. Though devout worshipers of Brahma, no distinction of caste exists among them. Consult Grant-Duff, 'History of the Mahrattas' (Bombay 1863); Kincaid, C. A. and Parasnis, R., 'A History of the Maratha People' (Vol. I, London 1919); Ranade, 'Rise of the Maratha Power' (ib. 1900); 'Imperial Gazetteer of India' (Oxford 1909).

MAI, Angelo, än'jā-lō mā'ē or mī, Cardinal, Italian classical scholar: b. Schilpario, near Bergamo, Italy, 7 March 1782; d. Albano, 8 Sept. 1854. His abilities attracted the notice of Father Mozzi, a Jesuit, who instructed him in Latin, Greek and mathematics. On the establishment of a Jesuit college at Colorno, in the duchy of Parma, he accompanied Father Mozzi thither in 1799, and a few years afterward was made professor of Latin and Greek in the Jesuit college at Naples (1804). He was transferred to Milan (1808), where he became an associate of the Ambrosian College, and one of the curators of the Ambrosian Library. One special department to which he devoted himself was the examination of the palimpsests (q.v.) and through his industry in deciphering these, two volumes of fragments of Cicero's orations, of Lysimachus and of Isæus, a fragment of the 'Vidularia' (a lost comedy of Plautus), and a collection of the letters and other writings of Cornelius Fronto, the preceptor of Marcus Aurelius, were recovered and given to the world. In 1819 he was appointed chief keeper of the Vatican Library at Rome, and discovered beneath a manuscript of Saint Augustine's 'Enarationes in Psalmos' obliterated fragments of Cicero's treatise 'De Republica,' amounting to about a fourth of the original, which he published in 1822 with a critical commentary. A colossal work was then undertaken by Mai, the editing of the various unpublished manuscripts in the Vatican, sacred and profane. It comprises 10 quarto volumes, under the title of 'Scriptorum Veterum Nova Collectio e Vaticanis Codicibus Edita' (1828–38), and consists of numerous fragments, previously believed to be lost, of the ancient historians, such as Polybius, Diodorus Siculus, Dionysius of Halicarnassus, Dion Cassius, Appian and others, besides the various writings of the Fathers. In 1838 he was created a cardinal. A new collection, 'Spicilegium Romanum,' was published in 10 volumes between 1839 and 1844, and a patristic series, called 'Nova Patrum Bibliotheca,' issued between 1845 and 1853, closed his list of publications. Consult his life by G. Poletto (Siena 1887); also Prina, B., 'Biografia del cardinale Angelo Mai' (Bergamo 1882); Sandys, J. E., 'A History of Classical Scholarship' (Vols. I, III, Cambridge 1908).

MAIA, mā'ya, in Greek mythology, the eldest daughter of Atlas and Pleione. She was placed with her six sisters among the stars, where they have the common name of *Pleiades.* The Romans also worshiped a Maia, who was also called *Majesta,* and was afterward identified with the daughter of Atlas. The Tusculans called their principal deity *Majus.* The month of May is said to have received its name from them.

MAID OF ATHENS, immortalized by Lord Byron, was Theresa Macri, who 25 years after Byron's poem was written had lost her beauty, lived in a hovel in dire poverty and had reared a large family.

MAID MARIAN, a name given Matilda, daughter of Fitz-Walter, baron of Bayard and Dummow. She eloped with Robert Fitz-Ooth, an outlaw, and lived with him in Sherwood Forest. It is supposed that she was married by Friar Tuck to Fitz-Ooth, who was more commonly called Robin Hood (q.v.).

MAID OF THE MIST, (1) the name of a small steamboat used on the Niagara River below the Falls, to carry passengers close to the cataract. (2) A name given to the heroine of Sir Walter Scott's 'Anne of Geierstein.'

MAID OF ORLEANS, a name given Jeanne d'Arc (1412–31). See JOAN OF ARC.

MAIDEN, or **THE WIDOW,** an instrument of capital punishment used in Scotland during the 16th century, the prototype of the French guillotine (q.v.). It consisted of an upright frame and a broad piece of iron a foot or more wide, sharp on the lower part and loaded above with lead. At the time of execution this was pulled up to the top of the frame, in which was a groove on each side for it to slide in. The prisoner's neck being fastened to a bar underneath, on a sign given the cutting iron was let loose, and the head instantly severed from the body. Its first victim is said to have been Thomas Scott, executed 3 April 1565, one of the agents in the assassination of Rizzio. In 1581 it was used in the execution of the Earl of Morton, the alleged inventor.

MAIDEN QUEEN, in England, a popular title bestowed upon Queen Elizabeth.

MAIDENHAIR FERN. See FERNS AND FERN ALLIES.

MAIDENHEAD, England, market town and municipal borough in Berkshire, on the Thames, 24 miles west of London, on the Great Western Railway. It is an ancient town and was formerly known as Maydenhutt, or Maydenhith, and while its stone bridge which takes the London road over the Thames dates only from 1772 there are records of earlier bridges as early as 1297. It was incorporated as a guild to maintain the bridge by Henry VI, in 1451. It had formerly a large carrying trade in malt, meal and timber but it is now principally a residential town and pleasure resort for boating parties. The Wednesday market is still held under the charter of Queen Elizabeth, dating from 1582. Pop. about 17,000.

MAIDSTONE (Saxon MEDWEGESTUN) England, municipal and Parliamentary borough and the county town of Kent, 34 miles east-southeast from London, on the banks of the Medwey. The town consists chiefly of four principal streets, which cross each other at the market-place, with smaller ones branching off at right angles. Its fine old Collegiate Church of All Saints is supposed to be of the 14th century, and is one of the largest parish churches in England. It has historical associations with the rebellions of Jack Cade and Sir Thomas Wyatt, and was stormed by the Parliamentarians under Favifase in 1648. It has excellent educational institutions; schools, libraries, science and art institutions, museums, play grounds and parks. The chief industries are paper-making (for which there are several large mills), brewing, iron founding and the manufacture of agricultural implements. It is the centre of a great hop district, the cultivation of hops having been carried on since the seventeenth century. Corn markets and cattle markets are still held every week. From ancient Saxon times until 1830 malefactors were executed on Penenden Heath, now enclosed as a public recreation ground. Pop. 42,000.

MAIDU PEOPLE, an aboriginal Pujunan group of Indians of northern California, of which the chief tribe, the Concow, inhabited the region of the Upper Sacramento River. Their descendants are to be found in the Round Valley Reservation. Their communities comprised rough dwelling-places or hogáns built of boards, large circular halls or town-houses for assemblies and ceremonials and wicker storehouses for the winter supply of acorns which with piñons formed their staple food supplies. Their clothing was of the scantiest description; the chief of their numerous dances was the acorn dance; and they had a secret male society in which the initiatory age was 12. Consult Dixon, R. B., 'Maidu' (in Boas, 'Handbook of American Indians,' Washington 1911); id., 'Maidu Texts' (in American Ethnological Society Publications, Vol. IV, Leyden 1912).

MAIGNAN, Albert, äl-bär mā-nyän, French painter: b. Beaumont, Sarthe, 14 Oct. 1845; d. Paris, 29 Sept. 1908. He studied at Paris under Nöel and developed a strong and original manner in historical and landscape painting. At the Salon of 1879 he was awarded a first class medal. Amongst the most striking of his pictures are 'Dante's Meeting with the Countess Matilda' (1881) now in the Luxembourg; and 'Assault on Pope Boniface VIII at Anagni' in the New York Metropolitan Museum of Art.

MAIGRE, mā'gèr, or **MEAGRE,** a large European drum-fish (*Sciæna aquila*), common in the Mediterranean, where it forms one of the most important local food-fishes. It may attain a length of six feet, and its flesh has always been a favorite with epicures. Yarrell says that anciently on account of its large size it was always sold in pieces, and that the fishermen of Rome were accustomed to present the head, considered the finest part, as a sort of tribute to the three local magistrates who acted for the time as the conservators of the city.

MAIL-SHELL. See CHITON.

MAILDUN, mal'doon, **MAELDUIN,** or **MAELDUNE,** hero of Irish romance, 'Voyage of Maildun.' He was the son of Ailill Ocar Aga, of the tribe of Owenaght of Ninus, in County Clare, and before his birth his father was killed by pirates. He grew up handsome and accomplished, but had scarce reached manhood before he set sail with a crew of 60 men to find his father's murderer. For three years and seven months he voyaged on the Western Ocean seeing marvels such as no eyes had seen before. At length he found the murderer of his father, but pardoned him his wrong in gratitude to the great mercy of God who had delivered him from so many perils. Consult Joyce, P. W., 'Old Celtic Romances' (tr. from Gaelic, 3d ed., New York 1898); Tennyson, 'The Voyage of Maeldune.'

MAILLY, William, American Socialistic journalist: b. Pittsburgh, Pa., 22 Nov. 1871; d. 4 Sept. 1912. He was educated in the common schools of Scotland and England, and in 1895–

96 was editor of the Birmingham *Labor Advocate*. He returned to the United States and in 1898 organized the Social Democratic party of New York. He edited the *Social Democrat* at Haverhill, Mass., in 1899–1900; was associate editor of *The Worker* in New York in 1901 and in 1906–07; and managing editor of New York *Evening Call* in 1908–09. He was one of the organizers of Social Democrat, later Socialist, party at Chicago in 1898; organizer and secretary of the Socialist party of Massachusetts in 1902; and in 1905–06 he was a member of the National Executive Committee of the Socialist party.

MAIMON, mī'mŏn, **Salomon,** German philosopher: b. near Mir in Minsk, 1754; d. Siegersdorf, Lower Silesia, 22 Nov. 1800. He was trained for a rabbi, but having become acquainted with the philosophy of Maimonides, he made his way to Berlin, and studied modern philosophy, languages and some science. Besides cultivating his own mind, and teaching a little, he wrote some philosophical treatises and literary hack-work. Yet he had Mendelssohn, the philosopher, among his friends, was admired by Kant and attracted the attention of Goethe. This he owed to his 'Attempt at a Philosophy of Transcendentalism' (1790), in which he set out to supplement Kant's system with truths gleaned for the most part from Spinoza, Leibnitz, Hume, Locke and others. Consult Witte, 'S. Maimon' (Berlin 1876).

MAIMONIDES, mī-mŏn'ĭ-dēz, properly Moses Ben Maimon Ben Joseph (Arabic, Abu Amram Musa ibn Maimun Obeid Allah al Kortobi), Jewish scholar: b. Cordova, Spain, 30 March 1135; d. 13 Dec. 1204. At an early period he developed a taste for the exact sciences and for philosophy. He read with zeal not only the works of the Mohammedan scholastics, but also those of the Greek philosophers in such dress as they had been made accessible by their Arabian translators. In this way his mind, which by nature ran in logical and systematic grooves, was strengthened in its bent; and he acquired that distaste for mysticism and vagueness so characteristic of his literary labors. He went so far as to abhor poetry, the best of which he declared to be false, since it was founded upon pure invention — and this too in a land which had produced such noble expressions of the Hebrew and Arab muse. It is strange that this man, whose character was that of a sage, and who was revered for his person as well as for his books, should have led such an unquiet life, and have written his works so full of erudition with the staff of the wanderer in his land. For his peaceful studies were rudely disturbed in his 13th year by the invasion of the Almohades, or Mohammedan Unitarians, from Africa. They not only captured Cordova, but set up a form of religious persecution which happily is not always characteristic of Islamic piety. Maimonides' father wandered to Almeria on the coast; and then (1159) straight into the lion's jaws at Fez in Africa,— a line of conduct hardly intelligible in one who had fled for the better exercise of the dictates of conscience. So pressing did the importunities of the Almohad fanatics become, that together with his family Maimonides was compelled to don the turban, and to live for several years the life of an Arabic Marrano. This blot upon his fair fame — if blot it be — he tried to excuse in two treatises, which may be looked upon as his "Apologia pro vita sua": one on the subject of conversion in general (1160), and another addressed to his coreligionists in southern Arabia on the coming of the Messiah. But the position was untenable and in 1165 we find Maimonides again on the road, reaching Accho, Jerusalem, Hebron and finally Egypt. Under the milder rule of the Ayyubite caliphs, no suppression of his belief was necessary. Maimonides settled with his brother in old Cairo or Fostat, gaining his daily pittance first as a jeweler, and then in the practice of medicine, the while he continued in the study of philosophy and the elaboration of the great works upon which his fame reposes. In 1177 he was recognized as the head of the Jewish community of Egypt, and soon afterward was placed upon the list of court physicians to Saladin. When he died, his body was taken to Tiberias for burial.

Perhaps no fairer presentation of the principles and practices of rabbinical Judaism can be cited than that contained in the three chief works of Maimonides. His clear-cut mind gathered the various threads which Jewish theology and life had spun since the closing of the Biblical canon, and wove them into such a fabric that a new period may fitly be said to have been ushered in. The Mishnah had become the law-book of the Diaspora; in it was to be found the system of ordinances and practices which had been developed up to the 2d century A.D. In the scholastic discussions in which the Jewish schoolmen had indulged their wit and their ingenuity, much of its plain meaning had become obscured. At 23 Maimonides commenced to work upon a commentary to this Mishnah, which took him seven years to complete. It was written in Arabic, and very fitly called 'The Illumination'; for here the philosophic training of its author was brought to bear upon the dry legal mass, and to give it life as well as light. The induction of philosophy into law is seen to even more peculiar advantage in his 'Mishnah Tōrah' (Repeated Law). The scholastic discussions upon the Mishnah had in the 6th century been put into writing, and had become that vast medley of thought, that kaleidoscope of schoolroom life, known by the name of Talmud. Based upon the slender framework of the Mishnah, the vast edifice had been built up with so little plan and symmetry that its various ramifications could only be followed with the greatest difficulty and with infinite exertion. In turn, the Talmud had supplanted the Mishnah as the rule of life and the directive of religious observance. Even before the time of Maimonides, scholars had tried their hand at putting order into this great chaos; but none of their efforts had proved satisfactory. For 10 years Maimonides worked and produced this digest, in which he arranged in scientific order all the material which a Jewish jurist and theologian might be called upon to use. Though this digest was received with delight by the Jews of Spain, many were found who looked upon Maimonides' work as an attempt to crystalize into unchangeable law the fluctuating streams of tradition. The same objection was made to his attempt to formulate into a creed the purely

theological ideas of the Judaism of his day. His 'Thirteen Articles' brought on a war of strong opposition; and though in the end, the fame of their author conquered a place for them even in the Synagogue Ritual, they were never accepted by the entire Jewry. They remained the presentation of an individual scholar.

But his chief philosophical work, his 'Guide of the Perplexed' (Dalālat al Hāirin), carried him still further: and for centuries fairly divided the Jewish camp into two parties. The battle between the Maimonists and anti-Maimonists waged fiercely in Spain and Provence.

In the 'Guide of the Perplexed' Maimonides has also produced a work which was "epoch-making in Jewish philosophy. It is the best attempt ever made by a Jew to combine philosophy with theology. Aristotle was known to Maimonides through Al-Farābi and Ibn Sinâ (Avicenna); and he is convinced that the Stagyrite is to be followed in certain things, as he is that the Bible must be followed in others. In fact, there can be no divergence between the two; for both have the same end in view,—to prove the existence of God. The aim of metaphysics is to perfect man intellectually; the same aim is at the core of Talmudic Judaism. Reason and revelation must speak the same language; and by a peculiar kind of subtle exegesis — which provoked much opposition, as it seemed to do violence to the plain wording — he is able to find his philosophical ideas in the text of the Bible. But he is careful to limit his acquiescence in Aristotle's teachings to things which occur below the sphere of the moon. He was afraid of coming into contact with the foundations of religious belief, and of having to deny the existence of wonders. The Bible teaches that matter was created, and the arguments advanced in favor of both the Platonic and Aristotelian views he looks upon as insufficient. The Jewish belief that God brought into existence not only the form but also the matter of the world, Maimonides looks upon much as an article of faith. The same is true of the belief in resurrection. He adduces so little proof for this dogma that the people of his day were ready to charge him with heresy.

Maimonides is able to present 25 ontological arguments for his belief in the existence, unity and incorporeality of God. What strikes one most is the almost colorless conception of the Deity at which he arrives. In his endeavor to remove the slightest shadow of corporeality in this conception, he is finally led to deny that any positive attributes can be posited of God. Such attributes would only be "accidentia"; and any such "accidentia" would limit the idea of oneness. Even attributes which would merely show the relation of the Divine Being to other beings are excluded; because he is so far removed from things non-Divine, as to make all comparison impossible. Even existence, when spoken of in regard to him, is not an attribute. In his school language, the "essential" of God involves his "existentia." We have therefore to rely entirely upon negative attributes in trying to get a clear concept of the Deity.

If the Deity is so far removed, how then is he to act upon the world? Maimonides supposes that this medium is to be found in the world of the spheres. Of these spheres there are nine: "the all-encompassing sphere, that of the fixed stars, and those of the seven planets." Each sphere is presided over by an intelligence which is its motive power. These intelligences are called angels in the Bible. The highest intelligence is immaterial. It is the *noûs poietikós*, the ever-active intellect. It is the power which gives form to all things and makes that which was potential really existent. "Prophecy is an emanation sent forth by the Divine Being through the medium of the active intellect, in the first instance to man's rational faculty and then to his imaginative faculty. The lower grade of prophecy comes by means of dreams, the higher through visions accorded the prophet in a waking condition. The symbolical actions of the prophets are nothing more than states of the soul." High above all the prophets Maimonides places Moses, to whom he attributes a special power, by means of which the active intellect worked upon him without the mediation of the imagination. The psychological parts of the 'Guide' present in a Jewish garb the Peripatetic philosophy as expounded by Alexander of Aphrodisia. Reason exists in the powers of the soul, but only potentially as latent reason (*noûs húlikos*). It has the power to assimilate immaterial forms which come from the active reason. It thus becomes acquired or developed reason (*noûs epiktetos*); and by still further assimilation it becomes gradually an entity separable from the body, so that at death it can live on unattached to the body. In ethics Maimonides is a strong partisan of the doctrine of the freedom of the will. No one moves him, no one drives him to certain actions. He can choose, according to his own inner vision, the way on which he wishes to walk. Nor does this doctrine involve any limitation of the Divine power, as this freedom is fully predetermined by the Deity. But Maimonides must have felt the difficulty of squaring the doctrine of the freedom of the will with that of the omniscience of God; for he entrenches himself behind the statement that the knowledge of God is so far removed from human knowledge as to make all comparison impossible. Again, in true Aristotelian style, Maimonides holds that those actions are to be considered virtuous which follow the golden mean between the extremes of too much and too little. The really wise man will always choose this road; and such wisdom can be learned; by continued practice it can become part of man's nature. He is most truly virtuous who has reached this eminence, and who has eliminated from his own being even the desire to do wrong.

The daring with which Maimonides treated many portions of Jewish theology did not fail to show its effect immediately after the publication of the 'Guide.' His rationalistic notions about revelation, his allegorizing interpretation of Scripture, his apparent want of complete faith in the doctrine of resurrection, produced among the Jews a violent reaction against all philosophical inquiry, which lasted down to the times of the French Revolution. Even non-Jews looked askance at his system. In Montpellier and in Paris, his own Jewish opponents, not content with having gotten an edict against the use of the master's writings, obtained the aid of the Church (for the 'Guide' had been translated into Latin in the 13th century), and had it publicly consigned to the flames. But all

this was the only further evidence of the power which Maimonides wielded. The Karaites copied it; the Kabbalah even tried to claim it as its own. Many who were not of the house of Israel, as Thomas Aquinas and Albertus Magnus, acknowledged the debt they owed the Spanish rabbi; and Spinoza, though in many places an opponent, shows clearly how carefully he had studied the *Guide of the Perplexed.*

Consult Yellin, D., and Abrahams, I., *Maimonides* (Philadelphia 1903); Guttmann, J., *Moses ben Maimon,* 2 vols. (Leipzig 1908, 1914); Munz, J., *Moses ben Maimon* (Frankfurt 1912); Husik, I., *History of Mediaeval Jewish Philosophy* (New York 1916); Singer, C., *The Legacy of Israel* (Oxford 1927).

MAIN, mān, **Hubert Platt,** American composer and editor: b. Ridgefield, Conn., Aug. 17, 1839; d. Newark, N. J., Oct. 27, 1925. His father, Sylvester Main had written hymns for many years and the younger Main began at an early age, composing his first hymns at the age of fifteen. He was educated in the public schools. After working for a few years as a clerk and editor in New York, Main became employed in the company that developed into Biglow & Main, an enterprise in which his father was the junior partner. Main assisted in the compilation of more than 500 publications of Biglow & Main, being for 59 years an editor of song collections and other publications for church, Sunday school and college use, and became recognized as an expert hymnologist. His own work consisted of more the 1,000 hymns and sacred songs, as well as a great amount of secular music. With the collaboration of other writers of hymns and songs, Main was the author of *The Victory* (1870); *Christian Songs* (1872); *The Alleluia* (1880); *Harvest Gems* (1896); *Gems of Song for the Sunday School* (1901); *Gloria Deo* (1901); *Devotional Songs* (1903); *Hallowed Hymns* (1907); *Bixby's Home Songs* (1909); *Hebrew Hymnal* (1910); Ode Book, *Eastern Star* (1911); *Mission Hymnal* (1911–1914); *Quartettes and Choruses—Male Voices* (1912); *Hamilton College Songs* (1915). He also compiled *A Dictionary of American Musicians and Poets.*

MAIN, mān, a river of Germany, which has its source in the northeastern part of Bavaria, about 13 miles northwest of Bayreuth. It flows northwest to the border of Bavaria and then makes a succession of remarkable zigzags, continuing, however, in a westerly direction, till it reaches the border of Hesse, which it enters. It then flows circuitously west and joins the Rhine a little above the town of Mainz, after a course of over 300 miles. The principal cities which it passes are Wurzburg, Aschaffenburg, and Frankfurt. It is navigable for about 200 miles. By means of Ludwigs Canal (Ludwigs-Donau-Main-Kanal) navigation to the Danube is possible.

MAIN CURRENTS IN AMERICAN THOUGHT, An Interpretation of American Literature from the Beginnings to 1920, by Vernon Louis Parrington, in 3 volumes, the first two of which were published in 1927 and the following year won the Pulitzer Prize for history; the last volume, in fragment form, completed only to 1900, was edited by Professor E. H. Eby and published posthumously in 1930.

Volume 1, *1620–1800, The Colonial Mind,* examines those ideas which have become traditionally recognized as American, how and from where they came, and what influence they exerted in determining our characteristic ideals and institutions. The author describes the pressure of American environment on the 17th and 18th century European ideals from which resulted the overthrow of aristocracy and monarchy and the development of the principle of democracy. Volume 2, *1800–1860, The Romantic Revolution in America,* is concerned with the influence of French romantic theories, the rise of capitalism, and the transition to an industrial from an agricultural state. Social progress in terms of the emergent middle class was the predominant philosophy. Volume 3, *1860–1920, The Beginnings of Critical Realism in America,* is the author's analysis of the decay of the romantic optimism and the source of that decay is laid to three causes: the stratifying of economics under the system of centralization; the evolvement of a mechanistic science; and the development of a philosophy of skepticism which is resulting in the questioning of the ideal democratic spirit.

The author's main purpose, as a liberal thinker, was first to examine and understand in a true scholarly spirit the various points of view expressed in American literature, being guided by historical significance rather than aesthetic judgment, before offering his personal critique. Three phases of his method become apparent: he treats the literature of America as the outgrowth of racial strains, environment, and period; to this treatment he applies the theory of economic determinism as a means for a true understanding; and, he considers American literature as American thought, that is, the literature of a country is the reflection of its thought which in turn has been the result of economic forces acting on political, social, and religious institutions. Parrington, famous for his ability to reduce his thesis to a single phrase, sentence, or expressive figure, has summarized our intellectual history in three phases: "Calvinistic pessimism, romantic optimism, and mechanistic pessimism."

MAIN CURRENTS IN NINETEENTH CENTURY LITERATURE (*Hovedstrømninger i det 19. Aarhundredes europaeiske Litteratur*). This great work of Georg Brandes (1842–1927, q.v.) established its Danish-Jewish author's reputation as one of the greatest champions of freedom of inquiry and freedom of thought in the last quarter of the 19th century. Its six volumes consist of the following separate studies: *The Literature of the French Emigrés* (1872); *The Romantic School in Germany* (1873); *Reaction in France* (1874); *Naturalism in England* (1875); *The Romantic School in France* (1882); *Young Germany* (1890).

An English translation of the *Main Currents* was published 1901–1905. A partisan of French revolutionary ideals, an ardent admirer of his friends Taine, Renan, and John Stuart Mill, he sought in these volumes, based on lectures, to liberate Scandinavia from its provincial prejudices. He was an inveterate foe of romanticism.

MAIN STREET, a novel by Sinclair Lewis (q.v.), published in 1920. The following year it was dramatized by Harvey O'Higgins and Harriet Ford.

The central figure of the story is Carol Milford, an attractive, quick-minded, college educated librarian from the Twin Cities. Of a mercurial temperament and possessed by some-

what vaporous cultural enthusiasms, she allows herself to marry Will Kennicott, a phlegmatic, small town physician, and as his wife she attempts to reform both the unsightly material fabric and the provincial spirit of the raw Minnesota community in which Kennicott has established his not unlucrative practice. In the course of her crusade, Carol acquires a handful of sympathetic allies; Vilda Sherwin, an erotic, sharp tongued school teacher; the ineffectual yet perceptive lawyer, Guy Pollock, who has tarried too long in Gopher Prairie and become permanently infected by what Lewis calls the "village virus"; and Miles Bjornstam, odd job man extraordinary, who is a combination of resident agnostic, "radical," and gadfly.

Balked by Main Street's hostility, intolerance, smugness, and ignorance, and by its worship of dullness made God, Carol lives out the years before World War I in a state of uncertainity, satisified neither by marriage nor by parenthood. Somewhat in despair she drifts into an abortive love affair. Flight to wartime Washington with her child and the two years spent there give her an opportunity to review her life and her relations with her community. In the end her patient husband takes her back to Gopher Prairie, which she ultimately comes to accept as a place where, as she says of herself, she may not have won a single victory nor even have fought the good fight, but where, in spite of everything, she has steadfastly kept faith.

Originally conceived as a novel on the theme of the "village virus," with Guy Pollock as the fatally infected protagonist, *Main Street* underwent a long period of incubation in its author's mind. His sixth serious novel, it was written more to please himself than either his publisher or his hitherto modest public, and there is reason to believe that few, if any, expected it to be the very great popular success that it was, much less one of the foremost novels of the 1920's at home and abroad. As was the case with certain of its successors, notably *Babbitt* (q.v.) and *Arrowhead* (q.v.), *Main Street* caught a wave of inarticulate discontent and rode it in swelling triumph up the beach. That particular wave of national self-criticism has since subsided; yet detailed, acidulous, and authentic literary embodiment lives on in the mimic-history of Carol Kennicott. The argument of the book has elevated the concept of the universal Main Street into a social symbol, and its considerable artistry can still leave with the responsive reader the wistful, lingering essence of a life which is seen as permanently settled, its onetime elixir evaporated, the motionless, cloudy sediment of day to day existence alone remaining.

MARKHAM HARRIS,
Department of English, University of Washington.

MAINE, mān, SIR **Henry James Sumner**, British jurist: b. Kelso, Roxburghshire, Scot., Aug. 15, 1822; d. Cannes, France, Feb. 3, 1888. He was educated at Cambridge where he later served as regius professor of civil law from 1847 to 1854. He was in India as legal member of the council, 1862–1869. On his return, he was appointed professor of jurisprudence at Oxford in 1869 and held this post till 1878. He was appointed master of Trinity Hall, Cambridge, 1877, and professor of international law at Cambridge, 1887–1888. Among his more noted works were *Ancient Law* (1861), *Village Communities in the East and the West* (1871); *Early History of Institutions* (1875); *Early Law and Custom* (1883); and *International Law* (1888). Consult Duff, M. E. G., *Sir Henry Maine: a Brief Memoir of his Life* (New York 1892).

MAINE, the name given as early as 1622 to distinguish the mainland from the islands. It was called in the Mason and Gorges patent of 1629, "the Mayn Land of New England," and in the great charter of 1606 to the Plymouth Company, "Province of Main." As a province of Massachusetts, it was admitted to the union as the 23d state in 1820. Popularly known as the "Pine Tree State," it is one of the New England group of North Atlantic states and the most easterly state of the union. It is bounded on the north by Quebec and New Brunswick, provinces of Canada, and on the east by New Brunswick and the Atlantic Ocean, on the south by the Atlantic Ocean, and on the west by the State of New Hampshire and the Province of Quebec. Its greatest extent is from north to south, its greatest length about 322 miles, and its greatest width about 207 miles. Maine is as large as all the rest of the New England group, lacking 385 square miles, and it is the 38th in size among the states of the union.

State flag.

Land area	31,040 square miles
Water area	2,175 square miles
Total area	33,215 square miles
Latitude	43° 4′—47° 28′ N.
Longitude	66° 57′—71° 7′ W.
Altitude	sea level to 5,268 feet
Population (1950)	913,774
Capital city—Augusta; Pop. (1950)	20,913
Admitted as a state	March 15, 1820
Bird	Chickadee, approved April 6, 1927
Flower	White pine cone and tassel, adopted 1895
Motto	*Dirigo* (I direct)
Nickname	Pine Tree State
Song	*State of Maine Song*, adopted 1937
Tree	No official tree

State seal.

Physical Characteristics. — *Topography.* — While its northeastern and a portion of its southwestern boundary lines are straight, its others

are irregular, especially its coastline, which, fringed by islands, is indented by numerous bays, giving it a shore length of over 2,000 miles, though a direct line drawn from its two extremities would be but about a tenth of its real length. This irregular coastline, bold and rugged from its eastern extremity until it reaches Penobscot Bay, becoming lower as it approaches the south, is most picturesque throughout its entire length, much of it being bordered by sandy beaches and thick forests reaching to the water's edge. There are more good harbors on the coast of Maine than on that of any other state on the Atlantic seaboard.

There are two general mountain slopes in Maine, the highest part extending across the state from north of the source of the Magalloway River in the west, northeast to Mars Hill. South of the main divide is Mount Katahdin, 5,268 feet in height; Mount Abraham, 3,388; Saddleback, 4,116, and Mount Blue, 3,187 feet in height, all in Franklin County. There is no long range of mountains in the state.

Climate.—The climate is cold a considerable part of the year; snow covers the ground from three to five months. The summers are short; even in the southern part of the state there is not more, usually less, than five months for the maturing of crops. The extensive forests have been a protection against cold weather, and with the good river drainage and the sea breezes have tended to make the climate healthful. A fair average of the mean temperature in January is 15°F.; in May 52°F.; in July 68°F.; in October 51°F.; in December 22°F. The average temperature in the whole state is in summer about 62.5°F. and in winter 20°F.

Geology.—The nature of the geological formation of Maine shows that it belongs to one of the oldest parts of the United States. The marks of the glacial period may be plainly traced in several parts of the state; the changes in extent and form of the river beds and lakes are shown by the rock formation of the vicinity and the nature of the deposits which the glaciers brought from the mountains to the valleys. The northern portion of the state belongs to the Devonian period, and the region about Penobscot Bay to the Silurian. In the southern part of the state are fossiliferous clays. There are a number of low ridges which evidently were once portions of mountain ridges, but which usually formed angles with the two great ranges that at one time extended across the state.

Rivers, Shoreline, and Lakes.—That portion of the state north of the main divide is drained almost wholly by the Saint John River and its tributaries, and the part south of the main divide is drained chiefly by the Androscoggin, Kennebec, Penobscot, and Saint Croix rivers. The basin of the Saint John River has an area of about 7,425 miles. The headwaters of this river are in the northwestern part of Maine and the eastern part of Quebec, and it flows north by east for some distance past St. Francis on the north to the extreme northeastern boundary of the state, where it turns and flows generally southeast through New Brunswick to the Bay of Fundy. The largest Maine tributaries of the Saint John are the Aroostook and the Allagash. The waters of a large number of the lakes of Maine find their outlet through the Saint John. The rivers south of the main divide flow generally south to the ocean. The source of the Kennebec is about 2,000 feet above the sea, of the Penobscot over 2,300 feet, of the Androscoggin about 3,000 feet, and of the Saco in the southwest nearly 2,000 feet. They, together with their tributaries, are swiftly flowing streams, in many places passing over rocky beds which form rapids and falls and furnish extensive waterpower. (See section on *Natural Resources.*)

Old Orchard Beach and other famous beaches are a feature of the shoreline at the southern tip of the state; from Portland northeast along the coast there are hundreds of islands and a rugged, rock-bound coast, deeply indented with inlets and bays. The largest island is Mount Desert, on which is located the town of Bar Harbor, a well known summer resort. Portland, on Casco Bay, is the principal port; other ports and harbors include Bath, Rockland, Belfast, Searsport, Bangor, and Eastport.

Maine is justly famed for her hundreds of beautiful ponds and lakes, the paradise of the summer camper and the fisherman. Among the best known are the Rangeley Lakes, near the New Hampshire line, Sebago Lake, near Portland, and Moosehead, in the central portion of the state. The last named is about 40 miles long, being the longest lake wholly within the boundaries of a state of the United States. Many Maine lakes bear Indian names, as Nicatous, Pocumcus, Cobboseecontee, Mattawamkeag, Mattamiscontis. There are said to be 2,465 lakes in the state.

Political Divisions.—*Cities.*—Portland is the center of the only metropolitan area in Maine. Situated on Casco Bay, it is a trading and transportation area, with some light industry such as pottery and canning. South Portland, included in the area, was a shipbuilding city during both world wars. Casco Bay was the center of extensive naval operations during World War II. Auburn is the leading shoe manufacturing city of Maine, while Lewiston, Saco, Wilton, Old Town, and several others are known as textile centers. Sanford is known for its auto upholstery, carpets, and Palm Beach cloth. Millinocket, Madison, Old Town, Westbrook, and Augusta are known for a variety of paper products. Old Orchard, Scarboro, and York are principally summer resorts, along with many of the smaller towns with fewer than 2,500 persons. Eastport is the center of sardine packing, and the most easterly city in the United States. Waterville is the home of Colby College, Lewiston of Bates College, Brunswick of Bowdoin College, while Orono is the site of the University of Maine. Caribou, Fort Fairfield, Presque Isle, and Houlton are trading centers for the vast potato industry of Aroostook County. Norway is said to have the world's largest snowshoe factory and also the largest dowel mill. For population of cities and towns see back of state map.

Counties.—Maine has 16 counties which, with their county seats, are as follows:

County	County Seat
Androscoggin	Auburn
Aroostook	Houlton
Cumberland	Portland
Franklin	Farmington
Hancock	Ellsworth
Kennebec	Augusta
Knox	Rockland
Lincoln	Wiscasset
Oxford	South Paris
Penobscot	Bangor
Piscataquis	Dover-Foxcroft

County	County Seat
Sagadahoc	Bath
Somerset	Skowhegan
Waldo	Belfast
Washington	Machias
York	Alfred

The People.—*Origins.*—The population of Maine is chiefly representative of English, Scotch-Irish, French, and German stock. The earliest settlers were the English at Kittery, soon to be joined by some Scotch-Irish. Farther north, around Waldoboro, German families from Brunswick and Saxony settled in the 1740's. Irish settlers gave Limerick its name. French Protestants settled along the coast. Swedish settlers were brought over in 1870 to take up farms in the northeastern part of the state, forming the colony of New Sweden. There are only two tribes of Indians now represented in Maine, the Penobscots and the Passamaquoddies, who live chiefly on reservations.

Growth and Trends.—On April 1, 1940, Maine had a population of 847,226, an increase of 49,803, or 6.2 per cent over its 1930 population of 797,423. During World War II the population declined, due to losses to the armed forces and out of state war industries. The census estimate for 1948 was 900,000. The first census of Maine was taken in 1790 and returned a population of 96,540. The population has increased with every census since that time, except that of 1870, passing 100,000 between 1790 and 1800, 200,000 between 1800 and 1810, 300,000 between 1820 and 1830, 500,000 between 1830 and 1840, 700,000 between 1900 and 1910, 800,000 between 1930 and 1940, and 900,000 between 1940 and 1950. The population on April 1, 1950, was 913,774, representing an increase of 66,548, or of 7.9 per cent over the 1940 population. The density of population in 1950 was 29.4 inhabitants per square mile. Residents of rural areas numbered 441,774 (48.3 per cent) of the total. Fourteen of the 16 counties gained in population between 1940 and 1950, and Cumberland County, with an increase of 15.9 per cent, and York (13.3 per cent) and Penobscot (11.4 per cent) counties had the most rapid growths. There are 11 cities with populations of 10,000 or more, one (York) having reached this size since 1940. The largest towns, and the only two over 10,000 population are Sanford (15,177) and Brunswick (10,996). In 1950 there were a total of 21 incorporated and 73 unincorporated places of 1,000 inhabitants or more. According also to the 1950 census, females outnumbered males 459,629 to 454,145 and whites outnumbered nonwhites 910,847 to 2,927.

Famous Men and Women.—Maine has many native-born sons and daughters who are particularly worthy of mention. Among those in the literary field are: Jacob Abbott (Hallowell, 1803–1879), who wrote chiefly juveniles, including the popular Rollo books; Henry Wadsworth Longfellow (Portland, 1807–1882), a poet of outstanding distinction; Charles Farrar Browne (Waterford, 1834–1867), humorist, who wrote under the pseudonym of Artemus Ward; Harriet Prescott Spofford (Calais, 1835–1921), novelist and short-story writer; Sarah Orne Jewett (South Berwick, 1849–1909), who excelled in her stories of New England life; Thomas Bird Mosher (Biddeford, 1852–1923), publisher, who devoted his life to the publishing of choice editions, and *The Bibelot,* a monthly periodical; Edwin Arlington Robinson (Head Tide, 1869–1935), poet, and winner of the Pulitzer Prize three times; Kenneth Roberts (Kennebunk 1885–), one of the best writers of American historical romance; Mary Ellen Chase (Blue Hill, 1887–), educator and author; Edna St. Vincent Millay (Rockland, 1892–1950) writer chiefly of verse; and Robert Peter Tristram Coffin (Brunswick, 1892–) poet, essayist, and biographer.

Some of those who became famous in the world of art are: Benjamin Paul Akers (1825–1861), sculptor, born in Saccarappa, now Westbrook, whose *Dead Pearl Diver* described in Hawthorne's *The Marble Faun* is his best known work; Franklin Simmons (1839–1913), sculptor, born in Lisbon, now Webster, whose bronze statue of Longfellow is in Portland; Frederic Porter Vinton (Bangor, 1846–1911), portrait painter, having for subjects such men as Charles Francis Adams, Wendell Phillips, and William D. Howells; Benjamin Foster (North Anson, 1852–1926), landscape painter, and Waldo Peirce (Bangor, 1884–), artist, who is represented in many of the best art galleries.

In other fields of the artistic world we have: John Knowles Paine (Portland, 1839–1906), music teacher and composer; Annie Louise Cary (Wayne, 1842–1921), singer, who became one of the most celebrated of opera and concert contraltos; Lillian Nordica, pseudonym of Lillian Norton, (Farmington, 1859–1914), operatic soprano; and the two actresses, born in Rockland, Maxine Elliott (1871–1940) and her sister, Lady Forbes-Robertson (1874–), whose real names were Jessie and May Gertrude Dermot.

Others of note are: Rufus King (Scarboro, 1755–1827), statesman, who was a member of the Continental Congress, the federal Constitutional Convention, the Massachusetts ratification convention, and was minister to Great Britain twice; Dorothea Lynde Dix (Hampden, 1802–1887), humanitarian, known particularly for her work for the betterment of the treatment of the insane; Neal Dow (Portland, 1804–1897), temperance advocate, drafted Maine prohibition law and saw it passed; Hannibal Hamlin (Paris Hill, 1809–1891), political leader, member of the U.S. House of Representatives and Senate, governor of Maine, and vice president of the United States during the Civil War; Henry Varnum Poor (Andover, 1812–1905), economist, and founder of Poor's *Manual of the Railroads of the United States;* George Palmer Putnam (Brunswick, 1814–1872), who became head of a large book-publishing business; Melville Weston Fuller (Augusta, 1833–1910), jurist, became chief justice of the United States Supreme Court and also a member of the Permanent Court of Arbitration at The Hague; Thomas Brackett Reed (Portland, 1839–1902), lawyer and legislator, member of the U.S. House of Representatives and twice speaker of the House; Hiram Stevens Maxim (Sangerville, 1840–1916), inventor, best known for his invention of a recoil-operated machine gun; Hudson Maxim (Orneville, 1853–1927), inventor, and an expert in explosives; and Frank Andrew Munsey (Mercer, 1854–1925), publisher and owner of the New York *Evening Sun* and *Evening Telegram,* also *Munsey's Magazine.*

Natural Resources.—*Wild Life.*—The wild animals of Maine include the moose, white-tailed or Virgina deer, black bear, beaver, red fox, otter, mink, weasel, flying, red, and gray

squirrels, snowshoe hare, porcupine, muskrat, woodchuck, and wildcat. Canada geese, black duck, wood duck, woodcock, ruffed grouse, pheasant, and many other game birds are found in the state. The American eagle is found in Maine, as well as several varieties of gulls, hawks, and owls. Crows, starlings, and grackles migrate to Maine in large numbers, and songbirds in great variety spend part or all of the year there. Robins, bluebirds, orioles, catbirds, bobolinks, bluejays, kingbirds, kingfishers, sandpipers, several types of sparrows, thrushes, woodpeckers, flycatchers, and swallows are among the more common varieties. Loons abound on Maine lakes, where their eerie and haunting calls can often be heard in the night. (See also section *Fisheries* under *Production and Manufactures.*)

Plants.—Trees and plants common to northeastern United States flourish here. Common trees include: alder, American elm, white, yellow, and gray birch, white and red (Norway) pine, white, black, and red oak, beech, hemlock, cedar, maple, ash, spruce, fir, tamarack, poplar. Wild shrubs and grasses abound, and among its prolific ferns are the royal, ostrich, Christmas, evergreen wood fern, rock fern, marsh fern, lady fern, spinulose, cinnamon, and New York. The wild flowers of the state are numerous, from the trailing arbutus and flowering dogwood of early spring to the goldenrods and asters of late summer and fall. Wild roses are common, and in the ponds grow yellow pond lilies, white water lilies, and pickerelweed, and in the wet and moist places, pitcher plants, marsh marigolds, cardinal flowers, rose pogonias, calopogons, and the graceful meadow lilies and meadow rue. In the woods one finds the dainty, fragrant twinflower, and bloodroot, anemone, purple, yellow, and white violets, ladies slippers, goldthread, groundnut, bunchberry, checkerberry, Indian pipe, and partridge berry, to name only a few. The commoner field flowers include white and oxeye daisies, yellow and orange hawkweed, buttercups, and Queen Anne's lace. Edible wild berries include the blackberry, raspberry, huckleberry, low and high bush blueberry, cranberry, and strawberry.

Minerals.—A variety of semiprecious stones and minerals are found in Maine, including small amounts of gold. Tourmalines, aquamarines, beryls, and garnets are among the semiprecious stones, found chiefly in Oxford County. Iron and manganese are found in low grade ores. Slate, granite, silica, feldspar, mica, peat, cement, and lime are produced commercially; also clay, gravel, and crushed rock.

Clear cold water, sometimes with mineral content, pours forth from many springs in Maine, and numerous ponds and lakes are spring-fed. Poland Spring (Poland), Underwood Spring (Falmouth Foreside), and Sieur de Monts Spring (Acadia National Park) are among the best known springs.

Forests.—Maine became known as the "Pine Tree State" because of the large extent of the pine forests which once existed within its limits. The majestic "mast pine," furnished for many British and American ships, is now a thing of the past, although pine trees still grow in large numbers. The greater part of the state, perhaps two thirds in area, is wooded, with most of the northern and central areas not only wooded but lacking permanent settlements.

Soil.—The soil of Maine shows the effects of the glacial period, the greater part of the state being till, glacial debris, or heavy clay. The old lake beds, now dry land, and river margins are largely alluvial and in these limited areas the soil is very fertile, and extensive agricultural lands result, as in the Aroostook potato area.

Waterpower.—Among the state's resources, waterpower takes high rank. From many lakes and swift-flowing streams hydroelectric power may be obtained. Fear of outside interests and possible export of power from Maine led the state (1909) to enact the Fernald Act, prohibiting export of hydroelectric power. Efforts made in following years to obtain a modification of this policy have failed. An interesting idea was the plan of Duncan C. Cooper to utilize the enormous power generated by the tides of the Bay of Fundy. The flow of the tide is so great that it was estimated that power could be generated sixteen hours of every twenty-four. Originally proposed as an international project (the Passamaquoddy Tidal Power Development Project), it was later modified to be built without Canadian participation. The Franklin D. Roosevelt administration constructed Quoddy Village and began on the dams (1933–36). However, Congress refused appropriations in 1936 and work was abandoned after some millions were expended.

Parks, Preserves, and Reservations.—Although small, the Acadia National Park provides a unique combination of lake, mountain, forests, and rugged shoreline. Established by act of Congress (1916), and enlarged by gift and purchase, the park is situated chiefly on Mount Desert Island, with one section occupying the nearby mainland (Schoodic Peninsula). The motor road leading to the summit of Mount Cadillac (alt. 1,532 ft.) is famous for its extensive panoramas of land, sea, and islands. In addition to the usual roads, trails, camp sites, and park guides, there is an archeological museum with relics of early Maine Indian culture.

Among the several state parks, the most noted is Baxter State Park, named after the donor, ex-Governor Percival P. Baxter. This area embraces Mount Katahdin, highest peak in Maine, and several other mountains and extensive wild forest lands. Birds, animals, and wild flowers are protected in the national and state parks.

There are three Indian Reservations in Maine, one at Indian Island (Old Town), and two in Washington County. Under state guardianship there reside about 578 Indians of the Penobscot Indians tribe (originally called Tarratines or Tarrateens) at Old Town, and 653 of the Passamaquoddy Indians tribe in Washington County.

The establishment of St. Croix Island (7 acres), in St. Croix River, as a national monument was authorized on June 7, 1949. It commemorates the first French settlement in America. In 1604, prior to the settlement of Jamestown, Va., or Plymouth, Mass., an expedition led by the French explorer, Sieur de Monts and his lieutenant, Samuel Champlain, landed on the island and spent the winter there.

Other Points of Interest.—As Maine grew from the coast inward, many large mansions of the colonial period and later were built along the coast. One of the earliest of these is the William Pepperell House (1682) at Kittery Point. The Sparhawk House (1742) at Kittery was built by Sir William Pepperell, son of William Pepperell. It is considered an outstanding ex-

ample of Georgian architecture. In South Berwick is the beautiful home of Sarah Orne Jewett, built about 1780. It is particularly noteworthy because of its Doric portico and its central hall and stairway. Wiscasset is a charming small town with beautiful old homes built by sea captains and shipping merchants. Many of these houses are open one day in August to the public. The Wedding Cake House in Kennebunk is too ornate to be considered an example of good architecture, but it represents the scroll-saw era. The carved wooden trimmings give the effect of a paper lace valentine which seems appropriate as the house, so the story goes, was decorated by a sea captain for his bride who was deprived of her wedding cake by his sudden order to sea.

Production and Manufactures.—*Agriculture.*—The soil of a large portion of the state, over four fifths, is covered with forest and wood lots. The most fertile farm lands are in the Aroostook basin. According to the U.S. Bureau of the Census, the average farm contained 108.3 acres (1940), and only about 5 per cent of the farms were tenant occupied. Potatoes constitute the largest crop, Maine producing more potatoes than any other state (73,340,000 bu. estimated in 1948). Oats constitute the only grain crop of importance. Apples form an important crop and blueberries are significant, many being canned or frozen. Market gardening flourishes in limited areas, and dairying and poultry raising have come to be important sources of income. Sweet corn and peas of excellent quality are raised for canneries and freezing plants. Considerable hay is cut for stock feed. The canned corn industry originated with Isaac Winslow, who invented the process in 1838–1839. On March 8, 1853, he applied for a patent for preserving fresh green corn by a hermetically sealing process.

Farm values in Maine have reflected the inflationary periods following both World Wars, but have risen less than in most of the United States. Using 1912–1914 values as 100, Maine farmlands rose to 142 in 1920, were 94 in 1933–1935, rising slowly to 135 in 1946, while the national index rose to 152. (1946 figures as of Nov. 1, 1946.)

Fisheries.—Sea and shore fisheries of Maine provide a livelihood for considerable numbers as well as recreation for many more. Shellfish of commercial value include scallops, crabs, clams, lobsters, mussels, shrimps. The scallop industry is declining in importance. The commissioner of sea and shore fisheries estimated that 30,685,291 pounds of shellfish were taken in 1947, with a value to the fishermen of $8,943,321. The more important species of fish were: cod, haddock, hake, pollock, redfish, flounder, shad, whiting, mackerel, tuna, alewives, herring, smelts. Redfish and whiting are seldom eaten in Maine, while smelts, mackerel, and haddock are esteemed locally, although all varieties are exported. In quantity and value herring comes first, redfish, second. The larger herring are smoked, pickled, or used as bait, while the smaller ones are canned as sardines, Maine and California being the leading states in this respect. Lubec, Eastport, and a number of other coastal communities are known for their sardine canneries. The total poundage of fish taken in 1947 reached 150,747,978, valued at $3,442,449. Maine carries on a research and propagation program, notably in the case of the lobster, where a cooperative federal-state plan is operated.

Related to fisheries is the sea moss industry, relatively new in Maine, but which is expected to be of permanent value. In 1944 and 1945 a half million pounds was harvested annually from rocks along the coast. This plant possesses valuable food and chemical content, and does not require cultivation if the roots are not destroyed. It is "raked" and grows again before another season.

Forests.—Although a large portion of Maine is devoted to the growing of wood, pulp, and lumber, the character and utilization of the forest stand has changed considerably from the 19th to the 20th century. Pine and spruce were the trees most commonly exported in "long lumber." As the old growth was cut off, less valuable softwoods were utilized, such as poplar for wood pulp, and fir and hemlock for pulp and lumber. In the 20th century hardwoods have been more extensively used than before, especially for spools, dowels, furniture, sporting goods (skis, snowshoes, sleds), toys, and novelties. The state has many small mills and factories engaged in making the above products. At the same time, pulp and long lumber continue to figure prominently in the state, large quantities being cut during the emergency of World War II, and the building material and paper shortage that prevailed afterward. Maine led the nation in white pine cut in 1944 by producing 295,723,000 board feet, about 24.4 per cent of the total cut. With the growing scarcity of accessible old growth trees, both private owners and the state government have placed emphasis on conservation and reforestation.

LAND AREA OF MAINE

Census figures of 1940 as revised by Maine Forest Service 1945

Item	Acres
Developed areas	248,183
Barren land	710,552
Agricultural areas	2,123,688
Federal forest areas	100,177
Maine Forestry District (Wild land townships)	10,000,000
Organized towns forest land	6,683,000
Total forest land	16,783,177
Grand total	19,865,600

It will be seen from the table that over half the state is "wild land," that is, has no local government and few permanent inhabitants. The land owners are assessed a "forestry district" tax for the fire protection and other services performed by the state in this area by the Maine Forest Service. The organized towns and cities cooperate with the state in guarding and servicing the organized towns forest land which makes up about one third of the state.

Disease and insect research and control are carried on by state and federal agencies. White pine blister rust has been brought under control since it was first discovered in the state in 1916. Beech scale was estimated by the Maine Forest Service as having killed 21 per cent of the beech in the state with 17 per cent more dying (1946). In the same year the bronze birch borer (*Agrilus anxius*) was estimated to have left 76 per cent of the valuable white and yellow birch stands dead or dying since entering Maine from New Brunswick in 1939. The Maine Hardwood Association is assisting the state in research and control measures. The forest service tries to prevent and limit fire damage by a program of education and action. Fire lookout towers are located at strategic points, and forest wardens use telephone, "walkie talkie," and mobile radio,

trucks, and airplanes as part of their equipment in fighting fires. The majority of fires are known to be caused by human carelessness, mainly from campfires and cigarettes. The following table summarizes damage for the years indicated.

FOREST FIRE DAMAGE IN MAINE
(Forest Commissioner's Report)

Year	Number	Acreage	Damage
1942	225	4,993	$ 11,633
1943	129	7,168	$ 39,910
1944	408	24,203	$278,867
1945	214	4,950	$ 62,583
1946	576	10,327	$ 95,932

Minerals.—See under *Natural Resources.*

Manufactures.—The extensive waterpower has been a great aid in developing manufacturing industries. Shipbuilding was among the first of the manufacturing industries of the state. The first vessel built in Maine was the *Virginia.* She was built by the Popham colony 1607–1608, and, under command of Capt. James Davis, sailed from Plymouth with the Somers and Gates colony for Jamestown, June 1, 1609. Bath was the chief shipbuilding center of the United States for over 100 years and is yet a shipbuilding center of importance. Prior to the construction of steel vessels, the Maine forests supplied a large amount of the timber used in ocean vessels built in the United States and nearly half the ocean vessels of the nation, up to 1900, were made in Maine. The manufacturing of cotton and woolen goods began the latter part of the 18th century and has been continued. Lewiston is the chief center of cotton manufacturing. Biddeford and Saco are extensively engaged in manufacturing cotton goods. Woolen mills are scattered throughout the state. Nearly all the factories are located near the coast, or in localities where abundant waterpower and good transportation lessen the cost of production and shipping.

Samuel Waldo, Thomas Westbrook, and Richard Fry were pioneers in the paper industry of Maine, having built a mill at Presumpscot Falls, Falmouth, in 1731, and a second mill at Stroudwater in 1733. At this time there were but three paper mills in the country, two being in Philadelphia and one in Milton, Mass. Robert Hallowell Gardiner and John Savels built the third mill about 1810. In 1816, Harris and Cox Brothers built a mill at North Yarmouth, and the same year another mill was built at Union by Joseph Day which was destroyed by fire in 1843. In 1823, George Cox and Company built a mill at Vassalboro which was burned in 1848 and not rebuilt. In 1845, Day and Lyon built a paper mill at Congin (now Cumberland Mills, Westbrook) which was burned in 1852, and was rebuilt by the S. D. Warren Paper Company on the site of the old mill. The paper industry in Maine received a great impetus by the introduction of wood pulp. Wood pulp was first produced in this state in 1868–1869. The second pulp mill was established in 1872 at Yarmouth. Sulphite pulp was first produced in Maine in 1889. Other sulphite, soda pulp, and ground wood mills have followed in rapid succession since these dates.

There is no coal and only a small amount of iron in the state and, as a result, the manufacturing industry is dependent upon waterpower. Fortunately the abundance of timber and the extensive waterpower available have to a great extent overcome the handicap of lack of coal. The leading industries are paper and wood pulp manufacture; cotton goods; woolen goods; boots and shoes; lumber and timber products; canning and preserving fish; canning and preserving fruits and vegetables; and foundry and machine shop products. Shipbuilding once so important now occupies a subordinate place.

Vacation Industry.—Thousands of tourists and vacationists flock to Maine, especially in the summer, and sportsmen continue to come well into the fall for the fishing and hunting seasons. The Maine Development Commission estimates that hotels, retail stores, and others profit by trade and employment given by these visitors from out-of-state. Maine's many lakes and streams abound in black bass, pickerel, salmon, and trout. Salt water fishing along the coast offers striped sea bass, Atlantic salmon, tuna, and more lowly varieties such as rock cod, cunner, and flounder.

Many miles of the Appalachian Trail offer sport for hikers and mountain climbers. Camping, canoeing, swimming, boating, golfing, and skiing are among the popular sports available, as well as beautiful and varied scenery and spots of historic interest. Fall hunting offers black bear, ducks, ruffed grouse, and other birds and animals. The Virginia deer is killed to the number of many thousands each year by native and out-of-state hunters. Caribou, once common, has become extinct, and small numbers of moose are protected by law.

Transportation and Communication.—The bulk of Maine's important export trade is funneled through Portland, by ship, rail, or truck. Some Maine potatoes are exported by boat from Searsport via the Bangor and Aroostook Railroad. Tariff barriers prevent free exchange of goods with Quebec, Novia Scotia, and New Brunswick, but American tourists bring back considerable quantities of goods, and there is some commerical exchange of goods, as well as a certain amount of illicit trade made possible by Maine's long boundary adjacent to Canada. Bangor is second to Portland as a distribution and trading center. One commercial airline enters Maine (Northeast Airlines) and uses airports at Portland, Augusta, Bangor, and Presque Isle. Bangor Air Base, built for defense purposes during World War II, was converted to an army fighter base in 1947, and the City of Bangor acquired the nearby airport at Old Town for commercial planes to use. Many primary and auxiliary airports built or improved by the army and navy for World War II have been abandoned for military purposes, as at Brunswick and Sanford (navy), Presque Isle and Houlton (army). The army commenced construction of a huge bomber base at Limestone during 1947, from which long-range bombers might range across the Arctic to various countries in Europe and Asia.

Highways of the state total 21,958 miles. Electric railways and narrow gauge steam lines have virtually disappeared from the state, but steam railroad mileage totals 2,778 (chiefly Boston and Maine, Maine Central, Bangor and Aroostook, Canadian Pacific and Canadian National railroads). Local, interstate, and international bus and truck services are extensive in number and coverage. There is some general waterborne shipping in and out of Portland, potatoes are shipped from Searsport, and coal, oil, and pulpwood are brought into various Maine ports,

but on the whole the importance of seaborne cargo and passenger traffic has declined greatly since the 19th century. The New England Telephone and Telegraph Company and its subsidiaries reach nearly all communities in Maine, with dial service being installed gradually. The Western Union Telegraph Company has about the same coverage, with central offices at hand or available by telephone throughout the state. Electric power, lacking in many rural sections, is gradually being extended.

Economic and Financial Factors.—*Banks.*—The 33 national banks in Maine reported, as of June 30, 1948, total assets of $244,456,000 and total deposits of $221,289,000. State banks, as of the same date, numbered 63, with total assets of $547,268,282 and deposits totaling $457,208,752. The Maine banking department supervises savings banks, trust companies, and building and loan associations.

Finance.—The financial condition of the state for the fiscal years 1947–1948 and 1948–1949 follows:

	Year Ending *June 30, 1949*	Year Ending *June 30, 1948*
Total revenues	$58,156,895.53	$54,394,957.12
Total expenditures	58,063,521.82	51,993,381.27
Excess of revenues over expenditures	93,373.71	2,401,575.85
Bonded debt	10,221,500.00	11,925,500.00

Taxation.—The major sources of state revenue in 1948–1949 were: gasoline and motor vehicle taxes, 30.81 per cent; federal subsidies, 17.63 per cent; liquor and beer revenues, 11.92 per cent; state tax on cities and towns, 8.29 per cent; public utility taxes, 4.76 per cent; cigarette and tobacco taxes, 3.89 per cent. Maine has no sales or income tax. Local governments (cities, towns and special districts) are financed largely from local taxes on real estate and personal property, plus state aid for education and highways.

Government.—The state constitution was adopted by the people in town meetings, Dec. 6, 1819, and Maine was admitted to the Union as a state March 15, 1820. To amend the constitution requires a state convention or a two-thirds vote of both houses of the legislature, followed in either case by a majority vote at the next regular election. All changes have been by legislative proposal, the 63d and 64th amendments having been accepted by the voters in 1944. The original constitution is not basically altered by the sixty-four amendments. It cannot be changed directly by the voters, as there is no constitutional initiative provision.

Executive.—There have been over 50 governors of Maine. The term of governors and legislators was one year until the biennial election was adopted by amendment 23 in 1879. Tradition allows a governor one re-election, and since 1879 no incumbent has served more than two terms. The governor is the only state official elected by the voters; there is no lieutenant governor, and department heads are appointed by the governor and council or elected by the legislature. In the 20th century (up to 1949) there has been no legislature controlled by the Democrats, and but three Democratic governors, of whom only one served two terms. (See table).

The governor of Maine has the veto power but no pocket veto or item veto. He is further limited by the constitutional and legislative powers of the governor's council of seven persons, who are elected biennially by the houses of the legislature by joint ballot, one from each of seven council districts. The governor's council meets at his call (regularly every two weeks in practice) and advises him on many matters. It has the power to confirm or reject nominations for appointive office, including heads of departments and judges. It also has fiscal and electoral powers, and sits with the governor as a board of pardons. In case of vacancy in the office of governor, the president of the Senate and speaker of the House are respectively in line of succession. No department head is elected by the voters in Maine, but several are elected by joint ballot of the legislature: secretary of state, treasurer, attorney general, auditor, and commissioner of agriculture.

Legislature.—The legislature is composed of a Senate of 33 members and a House of Representatives of 151 members, all elected biennially on the second Monday in September. They meet in regular session on the first Wednesday of January in the odd-numbered years, the regular session lasting until the leaders see fit to adjourn, which is in late April or May. Special sessions may be called by the governor, who may deliver messages and suggest programs but cannot limit the time or subject matter of any session, regular or special. Senators are chosen

by counties on a basis of population; representatives are elected from districts which consist of a city or one or more towns, with the rural areas receiving more weight than population alone would give, by means of the constitutional sliding scale or "rural gerrymander." Revenue bills originate in the House of Representatives; and impeachments also originate there, but the Senate judges the cases. The governor's veto may be overcome by a two-thirds vote of each house. An uncommon and useful feature of legislative procedure is the joint committee system, whereby all standing committees contain members from each house, thus expediting work and lessening the likelihood of disagreement and stalemate. Another good feature is the requirement that all bills be reported out of committee, preventing "pigeonholing" or "pickling in committee." The state has three representatives in Washington.

Judiciary.—There are three levels of courts in Maine: at the top the supreme court, next the superior and probate courts, and municipal and trial justice courts at the bottom. The only judges who are elected are the probate judges, one to each county, who are chosen for four-year terms. Their work is mainly the probating of estates, and the salary varies from county to county. All other judges are appointed by the governor and council, with the municipal judges serving four years, all others having seven-year terms. Trial justices and municipal courts hear a variety of petty criminal cases and a smaller number of civil cases. The municipal courts also serve as juvenile courts. Appeals from a trial justice court or municipal court go to the superior court of the county The lower courts hold preliminary hearings in important criminal actions, such as murder and manslaughter cases, to determine whether the suspect shall be held for the grand jury. If probable cause is found and the county grand jury indicts, the accused is brought before a superior court judge and a jury for trial. Civil actions of consequence start in the superior court. The supreme court has the usual function of deciding appeals on legal questions. It also has the less common duty of rendering advisory opinions when requested by the legislature or the governor. There are six judges on the supreme court, the five associate justices receive statutory salaries of $10,000, and the chief justice, $11,000; the superior court contains seven judges whose pay is fixed by the legislature at $9,500 and who are assigned by the chief justice of the supreme court to the terms of court in the various counties, one judge to a term. Each municipal court has one judge whose salary is fixed by statute, somewhat in accord with the volume of court business. Trial justices were put on salary in 1947 in place of the fee system formerly employed; their remuneration is fixed by the county commissioners in the respective counties. The pay in the lower courts is small, as it is considered to be a part time position. The attorney general is elected biennially by the houses of the legislature in joint session.

Public Health and Welfare.—Health and welfare agencies are combined in the department of the same name, which administers a variety of functions, including old age assistance, aid to dependent children, aid to the blind, mother's aid, and the work of district health officers and nurses. The commissioner of health and welfare is appointed by the governor and council. Many of the departmental functions are financed partially with federal funds. State hospitals and other institutions are headed by superintendents who are under the direction of the commissioner of institutional service, head of the department of institutional service, who is selected by the governor and council. There are thirteen state institutions, as follows: Augusta State Hospital, Augusta (insane); Bangor State Hospital, Bangor (insane); Pownal State School, Pownal (feeble minded); Central Maine Sanatorium, Fairfield (tuberculosis); Northern Maine Sanatorium, Presque Isle, (tuberculosis); Western Maine Sanatorium, Hebron (tuberculosis); Maine State Prison, Thomaston; Reformatory for Men, South Windham; Reformatory for Women, Skowhegan; School for Boys, South Portland; School for Girls, Hallowell; Maine School for the Deaf, Portland; Military and Naval Children's Home, Bath.

Social Legislation.—Unemployment compensation is in charge of the unemployment compensation commission of three members. Maine's workmen's compensation law is administered by an industrial accident commission of five members, of whom three are full time, the other two being ex officio (commissioners of labor and insurance). The law was broadened in 1945 to include occupational disease coverage. State employees are granted retirement and disability privileges under a retirement act passed in 1942. In 1947 the school teachers of the state were brought into the system under a new law, which gives them advantages not included in the former teachers' retirement act. The combined employees and teachers retirement system is managed by an unpaid seven-member board of trustees, which invests the funds contributed jointly by the state and the members, and lays down rules and policies which are carried out by a full-time secretary and his staff.

Suffrage and Elections.—With the exception of 1837 and 1840, the state went Democratic at state elections until 1852. In 1854, Anson P. Morrill was elected governor on the Republican ticket, and he was succeeded by a Democrat, but since 1882 there have been only three Democratic governors and only one (Brann, 1933–1937) survived for a second (two year) term. The Democratic party has not controlled a Maine legislature or governor's council in the present century, the three Democratic governors having been elected by "split-ticket" votes. Aliens and "untaxed Indians," (i.e., Maine Indians who as wards of the state are tax exempt and not entitled to vote), as well as paupers and persons under guardianship, are excluded from the franchise. Positive qualifications include: citizenship in the United States and the age of 21, residence in the state six months and in the voting area three months (city, town, or plantation), and the ability to pass a literacy test. Amendment 59 (1935) authorizes the use of voting machines, but the right remains almost unused, as the printed ballot is commonly employed in state, city, county, and national elections. Towns use the printed Australian ballot if the citizens so vote, otherwise they retain the older methods of oral voting, or non-Australian ballots of olden times. The primaries for state, county, and national elections are held in June in closed (party) primaries. Maine is the only state which elects United States senators and representatives in

September, along with state and county officials. This results in an additional election every presidential year, as the federal constitution requires the president and vice president to be voted on in November. For political reasons the state legislature has consistently refused to abandon the September election. Local election dates vary from place to place; city elections are generally in the winter, as set by the city charter, while towns hold their town meetings in the month of March, as their tax year begins on April 1. The statutory initiative and referendum took effect in 1909, by amendment 31 of the Maine constitution.

Local government.—In spite of the lack of home rule provisions in its constitution, the state allows local units much self-government. Cities must appeal to the legislature for their charters, but a new or revised charter is seldom denied, and, having passed the legislature, is then customarily submitted to the voters in a local referendum election. In the fields of education, highways, health, and welfare there is a considerable amount of state control and assistance, while local taxation and civil service are largely free from supervision. The basic feature of Maine town government is the annual town meeting, at which officers are elected, and taxes and appropriations are voted. Between town meetings, administration is handled by the board of selectmen, usually consisting of three persons, and such officers as tax collector, treasurer, assessors, overseers of the poor, and road commissioner. Maine cities are governed by the mayor and council or manager and council form of government, and a large number of towns have added the manager plan through a special town charter or the state enabling act. There are more town and city manager communities in Maine than in any other state (1947), including small communities as well as larger ones such as Portland, Bangor, and Auburn. Much of the state is surveyed into unorganized or wild land townships, which have no local government and little population. Besides cities, towns, and townships, there are a number of local units termed "plantations," lightly settled, and possessing a rudimentary local government somewhat like that of the towns. The sixteen counties serve chiefly as court and law enforcement areas. Each county elects a board of three county commissioners for overlapping terms. The voters also elect their sheriff, clerk of courts, register of deeds, county attorney, probate judge, and treasurer. Maine counties have little authority over roads and bridges, and none over education, welfare, or assessment of property, therein differing from the counties in many sections of the United States. The coroner has been replaced by a county medical examiner who must be a physician, and who is appointed by the governor, who also has power to remove the sheriff or the county attorney for cause, even though they are elected officers.

Education.—Public elementary and secondary education is free to all residents of the state between the ages of 5 and 21 years and compulsory for all between the ages of 7 and 15 years.

There is a school of education connected with the University of Maine, and departments of education in Bates, Bowdoin, Colby, and St. Joseph's Colleges. The State Teachers College at Farmington offers four years of training in the field of home economics, leading to the degree of bachelor of science in home economics, and three years of training in the field of elementary teacher training. Gorham State Teachers College at Gorham offers a four-year course leading to the degree of B.S. in elementary education and a four-year course in manual training leading to a degree in industrial arts. A junior high school teacher-training course is also offered at this institution. Aside from these two, the state has Washington State Normal School at Machias; Aroostook State Normal School at Presque Isle; and Madawaska Training School at Fort Kent, all of which offer teacher-training work. Eastern State Normal School at Castine was converted to the Maine Maritime Academy, which grants degrees to those who complete the course for maritime officers. There are a number of parochial schools in the state. Maine has about 60 institutes and academies doing work at the secondary school level.

Institutions of higher learning in the state, in addition to the University of Maine at Orono, include Bates College, a coeducational institution located at Lewiston; Bowdoin College (for men) at Brunswick; Colby College, coeducational, at Waterville; Nasson College (for women) at Springvale; Riker College, Houlton; St. Joseph's College (for women) in Portland; Bangor Theological Seminary (Congregational) and Northern Conservatory of Music, both located in Bangor. There are also three junior colleges—Westbrook Junior College, Portland; Portland Junior College, Portland; and Kent's Hill Junior College at Kent's Hill.

A public school fund was created in 1828. Certain parcels of land were set aside, and money received from these lands or the timber thereon formed the basis for a permanent public school fund. The interest on this fund plus biennial appropriations from other tax sources make up the resources for aiding the local governments in their public school program in Maine. In 1945, the legislature set the minimum salary of teachers at $1,000, and in 1947 increased the figure to $1,500.

Through a department of education, headed by a commissioner who is chosen by the State Board of Education, the state administers its teachers certification law, its curriculum supervision, and its school building standards. The school district system has given way to city and town jurisdiction over schools. Professional superintendents are certified after successfully meeting state standards as to education and training, and passing a written examination. They are paid partly by the state, and two or more small communities often join together in a "school union" under the guidance of one superintendent. The compulsory school law for children under 16 is enforced by local school officials and local truant officers. Since 1901 the state has, by legislative acts, provided special aid for instruction in institutes and academies. Towns not maintaining a "class A" secondary school must provide tuition for local pupils who wish to attend high schools in other communities. Summer schools are maintained in the state teacher training colleges, which operate under the jurisdiction of the commissioner of education.

Libraries.—The state maintains a free library for the legislature and general public in the state capitol at Augusta. The largest college

libraries in Maine are at Bowdoin and the University of Maine. Among the numerous local public libraries, the one at Bangor is outstanding and is said to be one of the best in the country serving a small city. Like most local libraries in Maine, it derives its major support from private benefactors, but receives some aid from the local taxpayers through their city government.

History.—Maine is supposed to have been visited by the earliest explorers: Gaspar Corte-Real in 1501 and Giovanni da Verrazano in 1524 reported a coast, the description of which corresponds with that of Maine. Estévan Gomez in 1525 sailed along the coast and named the Penobscot River, Rio de las Gamas, or Stag River. Sir John Hawkins, the famous Elizabethan seaman, explored the coast in 1565, and Sir Humphrey Gilbert in the voyage (1583) which cost his life was on his way to the Penobscot region, then known as Norumbega, to settle a colony under a patent from Queen Elizabeth. Barthelomew Gosnold, an Englishman (one of the founders of Jamestown), was visited by Martin Pring in 1603, by Sieur de Monts (Pierre du Guast) in 1604 and by George Weymouth in 1605. The first attempt to settle on the territory was made by the French under de Monts, who, having received a patent from the French king, planted a small colony on Neutral (St. Croix) Island in the Saint Croix River in 1604. The first colony settlement attempted by the English was at the mouth of the river Sagadahoc, now Kennebec, by George Popham and Raleigh Gilbert in 1607. A fort was erected and a number of buildings, and here the *Virginia,* the first vessel built in the country, was launched and subsequently formed one of the fleet of the Somers and Gates Colony in 1609. The colony at Sagadahoc was broken up by the death of Popham and great hardships endured by the colonists. They returned to England in the autumn of 1608. In 1613, French Jesuits established a mission on Mount Desert Island, but they were expelled by the English, under Sir Samuel Argall, the next year. In 1614, the coast was visited by John Smith from England, who found a few scattered settlers around Pemaquid Bay and on the Island of Monhegan, off the coast of that part of the state now included in Lincoln County. In 1616, Sir Ferdinando Gorges, "The father of American Colonization," who had sent Pring and Popham to Maine, sent his agent, Richard Vines, to Saco to remain during the winter to explore the country and test the climate. In 1620, the king of Great Britain made a division of the grand charter of 1606 and granted to the Plymouth Company in England, under the corporate name of the Council for New England, the whole country lying between 40° and 48° N., and to the Virginia Company the southern portion of the original patent. In August 1622, Gorges received a patent of territory between the Merrimac and Kennebec rivers, and the next year sent his son Robert as governor and lieutenant general of the country, accompanied by several councillors and a minister of the Church of England to establish worship. In 1629, another division of lands was made giving to Sir Ferdinando Gorges the country between the Piscataqua and Kennebec rivers, to which he gave the name of New Somersetshire, and the remainder to John Mason. The first court in the province was convened by William Gorges, nephew of Sir Ferdinando, at Saco, in March 1636. Charles I granted to Sir Ferdinando Gorges in 1639 a charter under which, in 1641, Gorges established the first chartered city in the United States, under the name of Gorgeana, and constituted it the capital of the province. What was then Gorgeana is now York. Its original name was Agamenticus. A fort was built here and efforts made to protect the people against the Indians. From 1630 to 1632 settlements were commenced in Saco, Biddeford, Scarboro, Cape Elizabeth, and Portland, all of which continued to prosper until the Indian War (King Philip's) of 1675, when they were overthrown. Massachusetts claimed a portion at least of the territory of Maine on the ground that its charter included the lands as far north as three miles above the source of the Merrimac; but those to whom other charters had been given resented her interference. In 1677, Massachusetts purchased from the heirs of Gorges all their interest in the province of Maine. A new charter, issued by William and Mary, in 1691 combined the provinces of Massachusetts, Plymouth, Acadia, Maine, and Sagadahoc into one province, called "The Royal Province of Massachusetts Bay." Maine was now a part of Massachusetts. Remote from the center of white settlements of any great size, Maine suffered from attacks by Indians, especially during the French and Indian wars. When King Philip's War was ended there were within its boundaries only five settlements.

Among the first soldiers in active service in the Revolutionary War were men from Maine, who fought as Massachusetts troops. A regiment from Maine was present at Bunker Hill. The British fleet, in 1775, attacked and destroyed Falmouth (now Portland). Off Machias was fought the battle in which the *Margaretta,* a British ship, was captured. At the close of the war Massachusetts still retained possession of the country and called it the District of Maine. The people of Maine were divided in their allegiance to Massachusetts; one party desired to remain a part of the Bay State and another party wanted independent statehood. The separatist movement gained ground during the War of 1812. Maine was admitted into the Union as a state March 15, 1820.

The northeastern boundary continued a source of dissension with Great Britain or between the people of Maine and New Brunswick until after the ratification of the Webster-Ashburton Treaty (q.v.) in 1842, which practically settled the eastern boundary between the United States and Canada. (See also BOUNDARIES OF THE UNITED STATES—*Northeastern Boundary;* MAINE BOUNDARY TREATY.)

For many years the liquor question was predominant and Maine took the lead in legislation regulating it. In 1821 a license law was passed and, in 1846, the first prohibitory law was passed, the sale of spirits being limited to medicinal and industrial purposes. This law was not well enforced and under the leadership of Neal Dow of Portland, ardent prohibitionist, the "Maine Law" of 1851 was enacted, prohibiting the manufacture and sale of intoxicating liquors. This law was repealed in 1858 but was reenacted later, becoming a part of the state constitution in 1884. Enforcement was always difficult and the constitutional amendment was finally repealed in September 1934.

Maine has always answered with a quick re-

sponse the call to national defense. In addition to sending men in World War II, Maine became the take-off base for much of our air force, as well as a shipbuilding center.

In 1879 a dispute arose as to the legality of the election of some of the members of the legislature and of the governor. For a time a disturbance was feared, but the militia preserved peace until the supreme judicial court rendered a decision making the Republican candidates legal members of the legislature. This state has had no serious internal troubles except the "Know-Nothing" agitation in 1854–1856, and the dispute about the legislature in 1879.

EDWARD F. DOW,
Head of Department of History and Government, University of Maine.

MAINE, The. A battleship of the United States Navy, mysteriously destroyed by explosion in Havana Harbor, Cuba, on the night of Feb. 15, 1898. The revolt of the Cubans in 1895 against Spanish misrule had brought the island in 1897–1898 to the verge of ruin. General Weyler y Nicolau had been recalled and General Blanco y Erenas was sent as governor general to endeavor to bring order out of chaos, but his plans failed and January 1898 witnessed serious disturbances. The American government, believing the lives and property of American citizens in Havana in danger, the *Maine,* which had been for some time at Key West, was ordered to Havana and arrived at that port Jan. 24, 1898. She was piloted into the harbor by an official pilot of the Spanish government and was moored to a government buoy. The usual official and international calls and salutations were exchanged between the Spanish authorities and the commander of the *Maine,* Capt. Charles D. Sigsbee, and outwardly there was no evidence of the impending disaster. The *Maine* carried 26 officers and 328 men, all of whom were on board when the explosion took place, except an assistant engineer, two naval cadets and a gunner. Two officers and 250 men were killed at once and 8 men died afterward in hospital. Only 16 of the crew wholly escaped injury. Of the dead, 166 were buried in Colon Cemetery, and 25 at Key West. In 1899 the dead buried at Colon Cemetery were brought to the United States and buried at Arlington with military and naval ceremonies. A court of inquiry, Capt. W. T. Sampson presiding, was instituted and after a month's investigation expressed the opinion that the vessel was destroyed by the explosion of a submarine mine, but responsibility could not be fixed upon any person or persons. Shortly afterward war was declared. (See UNITED STATES—*The War With Spain*).

There was a very general demand throughout the United States that the *Maine* should be raised, and on May 9, 1910 Congress authorized operations and the matter was placed in charge of the War Department, and assigned specifically to the engineer corps of the army. An elliptical coffer-dam, composed of a series of huge contracted cylinders that were constructed of interlocking steel piles and filled with mud and stone, was placed around the wreck. It was a wonderful piece of engineering, reflecting great credit on every army engineer connected with its inception and execution. The coffer-dam was completed June 5, 1911, and the entire wreck exposed November 2 following. A joint army and navy board, of which Rear Admiral Charles E. Vreeland was president, was then sent to Havana to reinvestigate the wreck. It reported Dec. 15, 1911, confirming the verdict of the Sampson court except in the nonessential detail that the center of the explosion was a little farther aft than was reported by that court. The after half of the hull, all that was not shattered, was floated Feb. 13, 1912, 14 years, lacking two days, after the *Maine's* destruction. On March 16, 1912 this relic of the once powerful battleship was towed to sea, with attendant ceremonies, afloat and ashore, and sunk in 600 fathoms of water. Concurrently 34 coffins, estimated to contain the bones of 64 of the *Maine's* dead, were placed on board an American war vessel and dispatched to Arlington, where, on March 23, they were buried in the *Maine* plot.

MAINE, University of, a co-educational institution, situated at Orono, Me., about nine miles northeast of Bangor. The campus of more than 200 acres borders a branch of the Penobscot River. A part of the public educational system of the state, the university is a land-grant institution, originally established as the State College of Agriculture and the Mechanic Arts under the provisions of the Morrill Act of 1862, and opened in 1868. The original name was changed to the University of Maine in 1897.

The university includes the colleges of arts and sciences, agriculture, technology, and the school of education. The Maine Agricultural station was established as a division of the university of 1887. Graduate instruction is given in various departments and since 1923 graduate work has been a separate division. A college of law was opened in 1898, but was discontinued in 1920.

The summer session offers a wide variety of academic and educational courses. Extension work in agriculture, forestry, and home economics is carried on throughout the state, co-operatively with the United States Department of Agriculture. A limited amount of work in other fields is offered through extension courses given by

various departments. To provide permanently for the support of the university, the state legislature in 1929 passed an act levying a tax of one mill on the general property valuation of the state. The degree of B.A., with specification of the major subject, is conferred upon students completing a curriculum in the college of arts and sciences. The degree of B.S. is conferred upon completion, in accordance with requirements, of four years' work in the colleges of agriculture and technology. In the school of education the degrees of B.A. and B.S. in education are awarded. The degrees of M.S. and M.A. in education are granted for one year's graduate work completed with distinction.

Seventeen fraternities and six sororities have chapters at the university. Some of the fraternities maintain houses of their own. Other men live in university dormitories and private homes. Women live in dormitories, one of which is operated co-operatively, thereby substantially reducing these students' expenses for room and board.

Seven national honorary societies have chapters at Maine. One of them, Phi Kappa Phi, was founded at the University of Maine in 1900.

ARTHUR A. HAUCK,
President.

MAINE BOUNDARY TREATY. The year 1910 witnessed the final settlement of the long-standing dispute as to the boundary line between Maine and New Brunswick. Secretary of State Philander Chase Knox, acting for the United States, and Ambassador James Bryce, on behalf of Great Britain, signed a treaty which established the exact boundary of Maine for all time.

At the close of the Revolutionary War in 1783 the first attempt was made to fix a satisfactory boundary, but it resulted only in hopeless dissatisfaction. Scarcely a diplomat had been sent to this country from England but had been called upon to familiarize himself with the Maine-New Brunswick boundary situation; while the United States State Department had gone over the ground so many times that that performance had almost come to be regarded as one of the regular duties of the department.

Most boundary lines are fixed by nature; those which are not do not as a rule amount to a great deal, and an amicable settlement can usually be reached at once. With the Maine-New Brunswick line, however, neither of these conditions ever applied. This disputed line ran through Passamaquoddy Bay, along the little islands at the mouth of the Saint Croix River. As a result of its indefinite character there had been endless dispute and strife among the fishermen who frequented those parts; disputes which had had an industrial significance since both the Eastport and Lubec canneries sent their men to this point, and it made a vast deal of difference whether they were fishing in American or Canadian waters.

The source of all the trouble was the looseness with which the first treaty, that of 1783, was drawn up. Article 2 of that document reads: "And that all disputes which might arise in future on the subject of the boundaries of the said United States may be prevented, it is herein agreed and declared that the following are, and shall be, their boundaries, viz.: From the northwest angle of Nova Scotia, viz: That angle which is formed by a line drawn due north from the source of the St. Croix River to the Highlands; along the said Highlands which divide those rivers that empty themselves into the river St. Lawrence from these which fall into the Atlantic Ocean, to the northwestermost head of the Connecticut River," etc.

Thus, while the Saint Croix was plainly named as the beginning of the eastern boundary, the only point mentioned was the source of the river, and not a word was said about its mouth or the numerous islands of the great bay into which it empties. Moreover, there arose at once the question as to what was the Saint Croix River. The first action toward a settlement was taken in 1794 when John Jay was charged to adjust the matter. All he was able to accomplish, however, was a provision in his treaty of that year for the appointment of three commissioners to determine just what was the Saint Croix River. These commissioners met at Halifax in 1798 and determined the river, but neglected to mention its source and made no disposition of the islands at its mouth. Subsequently there were treaties, conventions and declarations between the United States and Great Britain relative to this subject in 1814, 1818, 1827, 1842, 1846 and in 1870, but in every instance there was something still left to be adjusted around the mouth of the river.

The Treaty of Ghent in 1814 provided for commissioners to settle the matter and they decided that Moose, Dudley, and Frederick islands belonged to the United States, while all the other islands, including Grand Menan, were the property of Great Britain. This was very good so far as it went, but it left unsettled the status of several small islands in the Saint Croix and of the line itself through the bay. The channel thus remained in dispute.

In addition to this, trouble soon arose over the boundary line northward and westward from the source of the Saint Croix. The original treaty had been exceedingly vague on this subject. As early as 1803 and 1807 attempts had been made to determine the line of the highlands by negotiation of draft treaties which were never ratified. The joint mixed commission provided for by the Treaty of Ghent worked on the problem for six years (1816–22). Costly frontier surveys were undertaken, and these occasioned further acrimonious disputes. The only agreement ultimately reached was to disagree, and the commissioners adjourned without resorting to the provision for selecting a friendly umpire.

Finally, in 1827, King William I of the Netherlands was named as referee to conclude the dispute. After failing for a long time to satisfy either party with any of his suggestions, he drew a line to suit himself, awarding part of the disputed territory to Maine and part to New Brunswick. The United States rejected this arrangement, while in the meantime the disturbances on the border kept becoming more and more serious. Operations of the 1830 census takers in the contested area created much feeling, and eight years later an American lumber dealer was thrown into jail by New Brunswick officials—the act having much to do with the precipitation of the Aroostook war. Although no blood was spilled in this it came very near to maturing into a third war with England. A joint occupation was agreed upon as a temporary compromise, before Daniel Webster and Lord Ashburton came together in 1842

and drew up the famous treaty which settled all dispute as to that particular part of the boundary line.

It has been related as an historical fact that in these negotiations both nations withheld maps which were unfavorable to their claims. The Americans had one which had been discovered but a short time before in Paris, and was supposed to have been drawn up by Benjamin Franklin, while in the possession of the English was one made by Richard Oswald, who was one of the commissioners who negotiated in the treaty which gave the United States its independence. Later both nations showed these maps to their own people in evidence of how conclusively they had got the best of the bargain. Up to the present time, however, the United States has always regarded the signing of this treaty of 1842 as a diplomatic triumph.

The treaty of 1842, however, made no mention of any part of the boundary south of the monument which had been erected at the source of the Saint Croix, and until Secretary Knox and Ambassador Bryce signed their treaty of 1910 the lower part of the line in places was still contested. But with the signing of this latest treaty and the final settlement of the whole chaotic matter no point now remains between the United States and Canada which is in the slightest dispute.

MAINS. See ELECTRICAL TERMS.

MAINTENANCE, in its legal signification, the interference by a person in litigation in which he is not primarily interested, by assisting either party with money or otherwise. It includes champerty (q.v.), which consists of maintenance for reward or for a share in the proceeds of the litigation promoted. An agreement of this kind is illegal and void and at common law is punishable as an offense tending to obstruct justice. To-day where the common law prevails the wrongful intention with which the assistance is given is regarded as the gist of the offense. In many jurisdictions maintenance is no longer recognized as a criminal offense and in many States is not regarded as a civil cause of action by the injured party against a maintainor of the suit against him. See CRIMINAL LAW and consult the authorities referred to under that title.

MAINTENON, măn-tē-nôn, **Françoise d'Aubigné,** MARCHIONESS DE, French queen: b. Niort, Poitou, 1635; d. Saint-Cyr, 1719. Her birthplace was the prison in which her parents were confined because of religious trouble. After her father's death in her 10th year she became the ward of her guardian and aunt, Madame de Neuillant, who gave her a somewhat limited education and through whose efforts she became converted to the Catholic faith at about the age of 14. She was then returned to her mother, whose income was insufficient for the child's support. Her humiliation did not embitter her bright and cheerful disposition, however, and when at 16 the famous wit and man of letters, Scarron, deformed, old and infirm as he was, became her husband, and she was soon the centre of the clever literary people who frequented his house. When Scarron died, her good sense and delightful disposition recommended her to many friends, who pointed her out to Louis XIV as a fitting person to take charge of the education of the children born to him by Madame de Montespan. She undertook the office of governess to the royal children, won their affection and respect as well as that of the king, who married her in 1685 when she was 50 and he 47. There can be no doubt that she exercised a beneficent influence over the king's private life. She was undoubtedly disinterested and charitable, her character above stain in a profligate age, and her mind clear and resolute in pursuing the course she thought to be right. She survived the king four years and died at the nunnery at Saint Cyr which she had changed into a place of education for the poor daughters of families, having enjoyed to the end all the honor and position of a royal widow. Consult Blennerhassett, C. J., 'Louis XIV and Madame de Maintenon' (New York 1911); Dyson, C. C., 'Madame de Maintenon: Her Life and Times, 1635–1719' (London 1910); Geffroy, 'Mme. de Maintenon d'après sa correspondence authentique' (Paris 1887); Noailles, 'Histoire de Mme. de Maintenon' (ib. 1848–58); Pilastre, E., 'Vie et caractère de Mme. de Maintenon' (ib. 1907).

MAINZ, mints, Germany, a town in the state of Hesse-Darmstadt, on the left bank of the Rhine, opposite the mouth of the Main, 20 miles by rail southwest of Frankfort. It was a fortress of the first rank and is an episcopal see and a river port. The town rises gradually from the Rhine in the form of an amphitheatre. A railway bridge spans the Rhine a little above its junction with the Main, and a stone bridge connects with the opposite suburb of Kastel. A handsome quay, 330 feet wide, extends along the Rhine for a considerable distance, and large modern harbors have been constructed. The principal edifices are the cathedral, recently restored, a vast building of the 11th century; the former electoral palace, now containing the city library (230,000 vols.), picture gallery, museum of Roman and Roman-German antiquities, etc., the old collegiate church of Saint Stephen, occupying the highest site in the town, the church of Saint Peter, the German House, or grand-ducal palace with the arsenal adjoining, the courts of justice, the government buildings, public hall, two new concert halls, central railway station, etc. One of the most interesting objects in the town is the house of Gutenberg which contained his first printing office. A bronze statue of Gutenberg, by Thorwaldsen, stands in an open space near the theatre. The great open-air resort is the *Neue Anlage,* outside the gates, consisting of extensive public gardens, and commanding fine views of the town and surrounding district. The manufactures consist chiefly of leather, furniture, hardware, carriages, carpets, tobacco, beer, chemicals, musical instruments, gold and silver wares, machinery, soap, hats, etc. The trade, particularly transit, is extensive. The principal articles are Rhenish wine, corn, flour, oil, coal and wood. Mainz owes its foundation to a Roman camp which Drusus pitched here. On the decline of the Roman power it was almost entirely destroyed, but was afterward rebuilt chiefly by Charlemagne, and became the first ecclesiastical city of the German Empire, of which its archbishop-elector ranked as the premier prince. Pop. (1933) 142,627.

MAIPO, mī'poo, **or MAIPU,** a river in Chile, having its rise in the Andes Mountains and flowing almost due west into the Pacific Ocean. It is 120 miles in length. The falls and rapids furnish valuable water power, which has not been utilized to any great extent. The city of Santiago is a few miles north of the river. On 5 April 1818 was fought on the banks of the Maipo the battle which decided the independence of Chile.

MAIR, mār, Charles, Canadian writer: b. Lanark, Ontario, 21 Sept. 1840; d. 1906. He was educated at Queen's University, Kingston, and entered journalism. He aided in quelling the Riel insurrections and was one of the organizers of the «Canada First» party. Among his works are 'Dreamland and Other Poems' (1868); 'Tecumseh,' a drama (1886).

MAISON CARRÉE, mā-zoṅ' ka'rā, Roman temple at Nîmes, France, the most perfect of its type remaining. It was probably built early in the Christian era, its inscription dedicating it to the adopted sons of Augustus, Gaius and Lucius Cæsar, although by some authorities its date is placed at about the 2d century. It is built on the plan of the Parthenon although its dimensions are smaller. It stands on a podium 11 feet high, measures 40×82 feet and is entered by a flight of 15 steps. There are 30 columns, of which 20 are in the side and rear walls while 10 form the portico. The temple now houses collections of antique sculpture and coins.

MAISONNEUVE, mā-zŏṅ-nèv, **Paul de Chomedey,** Sieur de, French colonizer: b. Champagne, France; d. Paris, 9 Sept. 1676. He enlisted in the French army at 13 and later organized a band of colonists with whom he landed at Quebec in 1641. In 1642 he founded Montreal and was for 22 years its governor but was absent for a time in 1652 when he returned to France to conduct to America a new party of settlers. He displayed great administrative ability, but through the jealousy of De Mésy, governor-general of Canada, was in 1664 recalled to France by De Tracy. Though no charges were made against him he found no possibility of reinstatement in office and resigned in 1669.

MAISTRE, mā'tr, **Joseph Marie,** Comte de, French philosopher and savant: b. Chambéry, 1 April 1754; d. Turin, 26 Feb. 1821. He was of French extraction and was a senator of Piedmont at the time of the French invasion (1792). He left his country in consequence of that event, and afterward followed his king to Sardinia. In 1803 he was sent Ambassador to Saint Petersburg, and returned finally to Turin in 1817. De Maistre was familiar both with Greek and Latin literature, and his writings in French have obtained the highest praise of critics. He was a conservative in politics, religion and philosophy, a supporter of absolute monarchy and of the infallibility of the Pope, His 'Mémoires politiques et correspondance diplomatique' (published posthumously, 1858), however, shows him in the light of a much more discerning and less uncompromising politician than his formal treatises, and indicates a large and liberal appreciation of the revolution which he opposed. As a diplomatist he exerted himself to effect the restoration of all his former possessions to his master, and to obtain the transfer of Genoa. Among his political writings are his 'Eloge de Victor Amadée III'; 'Considérations sur la France' (1796); 'Essai sur le principe générateur des constitutions politique' (1810), in which he maintains the divine origin of sovereignty; 'Du Pape' (1819); 'Soirés de Saint Petersborg' (1821; new ed., 1888); 'De l'Eglise gallicane' (1821–22); and 'Du Congrès de Rastadt' (the last with the Abbé de Padt). 'Quatre chapitres inédits sur la Russie par le comte Joseph de Maistre' was published by his son in 1859. Consult Descostes, 'Joseph de Maistre avant la révolution' (Paris 1893); Lescure, 'Joseph de Maistre et sa famille' (ib. 1893); Paulhan, F., 'Joseph de Maistre et sa philosophie' (1893).

MAISTRE, Xavier de, French soldier, essayist and novelist, brother of Joseph de Maistre (q.v.): b. Chambéry, October 1763; d. Petrograd, 12 June 1852. He served in the Piedmontese army when very young, and his literary career began with his writing, 'Voyage autour de ma chambre' ('Journey Around My Room,' 1794), while in prison at Turin for participation in a duel. When Savoy was annexed to France he went to Russia and there secured a commission in the army, where he rose to the rank of major-general. He lived for a time in Naples after the restoration of the Piedmontese dynasty, but eventually returned to his adopted country and died there. His style was graceful and his work was marked by strong delineation of character and exceptional descriptive power. (See Journey Around My Room). He also wrote 'Le Lépreux de la cité d'Aoste' (1811); 'Les prisonniers du Caucase' (1815); 'La Jeune Siberienne' (1815); 'Expédition nocturne' (1825). His complete works were published in three volumes (Paris 1825).

MAISUR, mī-soor'. See Mysore.

MAITIN, mī'tăn, **José Antonio,** Venezuelan poet: b. Porto Cabello, 1798; d. Choroni Venezuela, 1874. In 1824 he returned from Havana to his own country whence he had fled on account of persecution, and made his home in the valley of Choroni. In 1844 his best poems were collected and published with the title 'Echoes from Choroni,' and in 1851 a collected edition of all his works appeared.

MAITLAND, Edward, English mystic and writer: b. Ipswich, 27 Oct. 1824; d. Tonbridge, 2 Oct. 1897. He was educated at Caius College, Cambridge, and was destined for the ministry, but declined to take holy orders because of his incompatible religious beliefs. He was one of the «Forty-niners» in California and later went to Australia where he became a commissioner of Crown lands. He was married and widowed in Australia and in 1857 returned to England where he engaged in literary work of an humanitarian order. He made the acquaintance of Mrs. Anna Kingsford in 1874 and with her crusaded against materialism, vivisection and the use of animal food. In 1876 he announced that he had acquired a new sense which enabled him to see the condition of peoples' souls, as well as those of trees and animals, and likewise revived his memory of his own previous incarnations. He joined the Theosophical Society in 1883, but shortly afterward withdrew from

it and with Mrs. Kingsford founded the Hermetic Society which was of mystic rather than occult character. After the death of Mrs. Kingsford in 1888 he maintained that they remained in communication. In 1891 he founded the Esoteric Christian Union. He wrote for the *Spectator* and the *Examiner;* reviewed books for the *Athenæum;* and collaborated with Mrs. Kingsford in writing 'The Key of the Creeds' (1875), and 'The Perfect Way; or the Finding of Christ' (1882). Author of 'The Pilgrim and the Shrine' (1867); 'The Higher Law' (1869); 'By and By: an Historical Romance of the Future' (1873); 'Clothed with the Sun: Being the Book of the Illuminations of Anna (Bonus) Kingsford' (1889); 'The New Gospel of Interpretation' (1892); 'Anna Kingsford, Her Life, Letters, Diary and Work, By her Collaborator, with a Supplement of Post-Mortem Communications' (2 vols., 1896). After the completion of the 'Life' of Mrs. Kingsford, which, like most of his writings, was largely autobiographical, his mental powers failed rapidly.

MAITLAND, Frederic William, English historian: b. London, 28 May 1850; d. 19 Dec. 1906. He was graduated from Trinity College, Cambridge, and studied law; in 1884 was made reader of English law at Cambridge and from 1888 was professor of the same branch there. He read widely on legal history, founded the Selden Society in 1887 for the study of the history of English law and was a generally recognized authority. Among his works are 'Gloucester Pleas' (1884); 'History of English Law,' with F. Pollock (1895); 'Canon Law in England' (1898); 'English Law and the Renaissance' (1901), etc.

MAITLAND, J. A. Fuller. See FULLER-MAITLAND, J. A.

MAITLAND, Sir Peregrine, British soldier: b. Hampshire, England, 1777; d. London, 30 May 1854. He enlisted in the army in 1792 and was promoted rapidly, serving in Spain and at the battle of Waterloo, where he was a major-general. In 1818 he was appointed lieutenant-governor of Upper Canada and in 1828–34 was governor of Nova Scotia. He was made lieutenant-general in 1830 and commanded the Madras army, 1836–38. From 1843–47 he was governor and commander-in-chief at the Cape of Good Hope.

MAITLAND, Sir Richard, Lord Lethington, Scottish poet and antiquary: b. Scotland, 1496; d. Edinburgh, 20 March 1586. He was educated at Saint Andrews and was one of the great lawyers of his day, and although he became blind in 1561 was nevertheless made a member of the Privy Council, and in 1562 keeper of the great seal. His manuscript collection of early Scottish poetry is preserved at Magdalene College, Cambridge. A selection from his collection, together with his own poems, was published in 1786, and his poems were reprinted in 1830 by the Maitland Club, a literary organization founded in his honor in Glasgow in 1828.

MAITLAND, William, Scottish statesman: b. Scotland, about 1528; d. Leith, 9 June 1573. He was a son of Sir Richard Maitland, Lord Lethington (q.v.), and was educated at Saint Andrews and on the Continent. He early entered political life and was interested in the Knox reform movement; in 1558 he was appointed Secretary of State by Mary of Guise, and is commonly called «Secretary Lethington.» He was one of the commissioners who concluded the Treaty of Berwick and in 1560 was speaker of the Scottish Parliament. He was one of Mary's ministers on her return from France, but was suspected of having betrayed her to Queen Elizabeth. In 1563 Maitland conducted a prosecution for treason against Knox whom he had earlier supported, and in 1565 he became lord of the sessions but was removed from office for implication in Rizzio's murder; he was also connected with the murder of Darnley. He contrived Mary's escape from Lochleven but fought against her at Langside. After the assassination of Moray he became the leader of the queen's party and was active in her support. He joined Kirkcaldy at Edinburgh Castle, and encouraged him to hold out until the last. He was taken prisoner at its surrender and died in prison. Consult Skelton, 'Maitland of Lethington and the Scotland of Mary Stuart' (1887–88).

MAITLAND, Australia, town, in Northumberland County, in New South Wales, on the Hunter River, about 119 miles north of Sydney by rail. It is connected by railroad with Newcastle, about 15 miles distant. The Hunter River divides the town into East and West Maitland, two distinct municipalities, West Maitland being the larger. The Hunter River frequently overflows its banks and floods the town and surrounding country. Although serious devastation results, the soil has been enriched by this flooding, and so fertile is this section that Maitland is called the «garden of New South Wales.» Grapes, grains, tobacco and vegetables grow in abundance. Large coal fields are near the town. Considerable manufacturing is carried on, especially in West Maitland. Pop. of East and West Maitland, 12,000.

MAIZE. See CORN, INDIAN.

MAIZEROY, René, Baron (real name René Jules Jean Toussaint), French novelist: b. Metz, 2 May 1856. He was educated at the Jesuit College of Saint Clement, the Toulouse Lycée and the Saint Cyr Military School, becoming second lieutenant in the 53d regiment of Infantry. He resigned from the army in 1881 and entered upon a literary career. He contributed to *Le Gaulois, Figaro, Gil Blas, La Vie Moderne* and *Clarion,* and became a voluminous writer of fiction, also producing several pantomimes, ballets and dramas. Author of 'Le Capitaine Bric-a-brac' (1880); 'Souvenirs d'un officier' (1888); 'L'Adorée'; 'P'ti'-Mi'; 'Le Reflet'; 'En Volupté'; 'Glorita, fille et marquise'; 'Yetto, mannequin'; 'Ville d'Amour'; 'La Mer' (1895); 'La Remplaçante' (1906); 'L'Amour en danger' (1912), etc. He died in 1918.

MAJESTY (Latin, *majestas*). *Majestas,* in a collective sense, was used in republican Rome to signify the highest power and dignity, the attribute of the whole community of citizens, the *populus.* The *majestas* was also ascribed to the dictator, consul, and even Senate, though in the case of the last the word *auctoritas* was used in preference. At a later period,

under the Roman emperors, *majestas* was the name of the imperial dignity, whilst that of a magistrate was called *dignitas*. To kings the attribute of majesty was given much later. The courtiers introduced the title into France under Henry II. In the Treaty of Crespy (1544) Charles V is styled *imperial*, Francis I *royal majesty;* and in the Peace of Câteau Cambrésis (1559) the titles of *most Christian and Catholic majesty* are found for the first time. In England Henry VIII first adopted the title *majesty, grace* and *highness* being the titles formerly employed. At present this title is given to all European emperors and kings.

MAJOLICA AND MEZZA-MAJOLICA. Spelled also maiolica. It is generally claimed that the word was derived from the island of Majorca, whence the first pieces of this ceramic ware were imported to Italy. The term majolica has become a very confused and indefinite expression and used by writers with different meaning. The term, in its first application, referred only to the early Italian lustre-ware made (15th century) with transparent silicious glaze and outer surface of metallic sheen in imitation of the lustre-ware of Hispano-Moresque creation. Later, the early enamel-covered and color-decorated wares of Italy were called majolica regardless of metallic lustre surface, and the lustre-ware having Oriental style of form and decorative treatment was termed *mezza-majolica.* But the term majolica has in modern times been vulgarized into a broader definition by the public including practically everything in ceramics having glaze coating and painted decoration. Leading experts retain the more distinctive terms. Lustre decoration consists of imparting a metallic or pearl-like (*nacreous*) sheen to the outer surface of the ceramic ware by coating over the already decorated and fired piece with a thin layer of a pigment containing either gold, silver, copper, etc., and then firing under moderate heat. The effects are very delicate and beautiful and are known, according to the different sheens produced, as ruby (rubino), gold, silver, mother-of-pearl (madreperla), etc.

Mezza-Majolica.— The earliest production of this ware was in Persia and Turkey, but it is only in quite recent years that the actual fabriques have been located. To this Turkish ware belong the pieces heretofore labeled «Lindos» and «Rhodesian» ware from the location of the sites where examples had been excavated. The actual sites of production now satisfactorily proven and dates of discovery of these prototypes of mezza-majolica are as follows: Rekka (1896), Sultanabad (1905), Rhages, quite recently. The ware formerly termed «Siculo-Arabian» is now said to have had its home in Syria or Egypt, and the so-called «Rhodesian» ware in Osmanli-Turkey. The latter has most brilliant coloring (blue, grayish-black, green, etc., and, later, red) and ornamentation as well as most masterly technique in execution. At Fostat, in Lower Egypt, lustred and unlustred ware was produced before the 12th century. We find among the Persian examples cylindrical vases, pear-shaped bottles, plates, tiles, bowls, mosque lamps, etc. In the Persian polychrome enamel-decorated ware of the 17th century we find dark blue, yellow, green, purple, red, black, turquoise, all on very white ground, with typical Persian decoration (arabesques, flowers, turbaned heads, figures, etc.). Such 17th and 18th century ware was produced in northeast Persia, Bokhara, Kirman, Kashan, etc. Practically all this ware had its body coated (*engobe*). The Mohammedan tiles (known in Arabic as *rojolos*) were very beautiful and utilized in covering outside spaces of the mosques as well as the internal wells. Grand effects are those presented in the Blue Mosque, at Tabriz (15th century) and at Khoda Bende Khan shrine at Sultanieh (14th century), etc. Spain produced glazed ware as early as the 8th century (mosque of Cordova has examples). Through its Moorish artists Spain produced lustre-ware, an industry doubtless derived from Oriental sources, at an early date, Calatuyad having both domestic and export trade in the 12th century. This same gold-lustre ware was produced in Malaga during the 14th century, and, by the end of the 15th century, Manises, near Valencia, was the centre for the gold-lustre ware industry, retaining its pottery kilns to the present day. The yellowish tin-glaze on Spanish majolica covers both the inside and outside of vessels. Color is mostly cobalt blue, but coats-of-arms show a sparse use of brown and violet. The great Alhambra vase and pieces of a similar character belong to the 14th century and were produced in Granada. This Hispano-Moresque art was continued by the Christians after the Moors were expelled, but it soon became decadent in merit. The Spanish colored glazed tiles (*azulejos*) had the centre of that industry, in the early period, in Seville, but no lustre-ware appears to have been made there. In the Spanish decoration predominating motifs were plant life, Arab scripts, figures of animals and concentric circles. The frequent display of heraldic coats-of-arms shows Christian tendency later. The ware consisted mostly of dishes, basins, ewers, vases, apothecary pots (*albarellos*), etc. Talavera, in the 16th to 18th centuries, produced tin-enameled ware prolifically. For some time, at least, Paterna, Quarte, Villelonga, Alaqua, Carcer, Moncada, etc., produced gold-lustre ware. The quality of the gold-lustre remained good into the 17th century though other ware became inferior long before. And the modern lustre shows coppery effect instead of the earlier pale gold tones. Alcora produced the best pieces. Sicilian (Siculo-Arabian) mezza-majolica ware dates back to the 9th century.

Majolica.— Italy imported her lustre-ware from Spain and the island of Majorca, apparently, till about the 15th century, but, by the middle of the 14th century she had started her own mezza-majolica fabriques and by the first half of the 16th century the industry was in its zenith, to become thoroughly decadent by the end of the 16th century. The recent discovery in Faenza of the piece decorated with Astorgio Manfredi (1393–1405) coat-of-arms and the documentary statement of the contemporary writer Pietro del Bono (1330) make it appear that Italy was producing opaque underglaze majolica in the 14th century besides her silicious transparent colored glazes (mezza-majolica). By the 16th century Italian majolica was being made in Pesaro, Urbino, Gubbio,

Caffagiolo, Treviso, Bassano, Nove, Padua, Candiana, Verona, Milan, Venice, Lodi, Turin, Genoa, Savona, Arbisola, Ferrara, Modena Reggio, Scandiana, Sassuolo, Siena, Pisa, Asciano, Monte Lupo, San Querigo, Castel Durante, Citta di Castello, Bagnolo, Faenza, Forli, Rimini, Ravenna, Bologna, Deruta, Fabriano, Spello, Viterbo, Rome, Capo di Monte, Naples, Grotaglia, Castelli in Abruzzo, Palermo and Catala Girone. Lustre-ware was produced only at Pesaro, Deruta, Gubbio, Urbino and Castel Durante; a few pieces made at Caffagiolo and elsewhere were experimental. The body of old Italian majolica is a buff-colored clay.

Gubbio.— This ware is famous for its lustre pieces. Those emanating from the studio (botega) of "Maestro Giorgio" (early 16th century) are all elaborately decorated and have a lustre surpassing all other wares. His metallic reflecting surfaces, Solon says, "pass from bluish-purple to ruby-red, from golden-yellow to emerald-green," his *madre-perla* is absolute perfection. Few Gubbio pieces bear any marks, but besides the before-mentioned Giorgio Andreoli were other Andreolis — Salembini, Giovanni and Vinzentio. The Gubbio fabrique was in decadent condition by 1551. The characteristic decoration of the ware consists of grotesques (*groteschi*), which the contemporary Picolpasso terms "a candelliere"; they contain artistically executed large scrolls (in yellow or brown) terminating in the heads of sea-horses, monsters, birds, etc., with cherub heads intermingling; trophies with mottoes surround busts. As centre-piece appears a genre or other scene. Human figures show weak drawing.

Urbino.— Under the powerful protection of Duke Guid'Ubaldo II this town took a leading position in the second half of the 16th century with its flourishing majolica fabrique and its remarkably artistic creations. As these pieces were produced for presentation to grandees and even sovereigns perfection of detail and talented elaborate composition were undertaken. So high is the artistic merit of some of the painting that it is claimed to have been from the designs of the great Raphael himself. Three artists are prominent in this work: Guido Durantino (or Guido Fontana), Francesco Xanto da Rovigo (both of these signed in full), the latter copied, with modifications, engravings after Raphael; and Orazio Fontana (son of Guido), whose drawings are characterized by a light outline in the blue color that was utilized in the flesh tints. The Fontanas did also peculiar grotesque decorations on a white background with very graceful effect, some having medallions of figures as centre-pieces. The Patanazzi family (end of the 16th century) were the last of the majolica painters of Urbino. Amongst Urbino motifs were figures, chimera, etc., also we find ornament in relief on salt boxes, inkstands, vases, coffrets, etc., of very decorative form. But the most remarkable production of Urbino was a series of vases designed by Battista Franco, 344 lovely specimens of which are in the Santa Casa de Lorette. The general belief in the claim of Vasari that the originator of the opaque tin-glaze in Italy was Luca della Robbia (1399–1482) has been shaken since the discovery of the Manfredi jug (mentioned above), and it is now supposed that Italian tin-glazed majolica was being produced by the 14th century at least.

Mexican Majolica.— Until about 10 years ago the fine specimens of old opaque tin-glazed majolica found in Mexico and sought for by collectors were supposed to be Spanish creations and imported by the colonists. Mrs. Robert W. deForest, with her fine collection of this ware (now donated to the New York Metropolitan Museum of Art), was led to take a generous interest in investigating the source of the product. And the late Dr. Atlee Barber of the Pennsylvania Museum, Philadelphia, by his researches disclosed the following facts: About 1526 the Spanish majolica technique was being taught to the colonists by Dominican friars from the Talavera potteries. In 1531 Pueblo de los Angeles started a pottery with Spanish artisans and became the centre of a large industry. Mexican-made enamel-glazed tiles were used, instead of the imported articles, to decorate the insides of the walls and also the exteriors of churches, hospitals, convents and even private houses. By 1653, as is shown by documents, the Mexican-made glazed pottery was equal to the imported and shipments from Spain were no longer in demand, and a potters' guild was established, to protect the industry in that year. By 1750 there were 30 prosperous potteries making three qualities of wares that they termed "fine, common and yellow." Five colors were used in fine ware, three in common ware. The best period was from 1650 to 1750. Specimens show two kinds of body — the white, soft, porous and the harder-baked red. The process used was that of baking the clay body first, then dipping in the tin enamel engobe and decorating over the enamel. The piece was then subjected to a second firing. The ware has been classified as follows: (1) "Hispano-Moresque" phase, up to the end of the 17th century. (2) "Spanish" or "Talavera" phase, from beginning of the 17th century to about end of the 18th century (showing Talavera influence). (3) "Chinese taste," done by copying pieces of imported Chinese porcelain, started 17th century and continued to end of 18th century. (4) "Hispano-Mexican" or "Puebla" phase, started about 1800 and lasted beyond 1850. Decadence followed, then extinction. The fourth style has green, yellow, purple, brown, red, black and later rose and mauve, in the decoration. Tiles have only three colors, blue, green and yellow, generally. The product consisted of chocolate or vanilla jars, vases, albarelli (drug pots), barrel-shaped flower jars, circular dishes, bowls, saltcellars, inkstands, basins, cup-holders, tiles, etc.

CLEMENT W. COMBE.

MAJOR, Charles (EDWIN CASKODEN), American novelist: b. Indianapolis, Ind., July 25, 1856; d. Feb. 13, 1913. He was educated in the public schools and studied law, establishing a practice at Shelbyville. He contributed to various magazines and published *When Knighthood was in Flower* (1898); *The Bears of Blue River* (1901); *Uncle Tom Andy Bill* (1908); *Dorothy Vernon of Haddon Hall* (1902); *Yolanda, Maid of Burgundy* (1905); *Gentle Knight of Old Brandenburg* (1909); *The Little King* (1910); *Touchstone of Fortune* (1912).

MAJOR. *In military science,* the major is a field officer ranking next below a lieutenant colonel and above a captain. He has generally the command of a battalion, the exercises of which he superintends, and in action or on parade carries into effect the orders of his superior officer. The term in the French service has been superseded by that of *chef dè bataillon.* A brigade major is an officer who performs for a brigade, or in garrison, the duties ordinarily discharged by a major in a regiment or battalion. A major general ranks next above a brigadier general. In other cases, the term major, when applied as an epithet to the several denominations of men in an army, signifies the superior of the department; as sergeant major, the chief noncommissioned officer in a regiment, who assists the adjutant; drum major, the chief of the drum corps, etc.

MAJOR BARBARA, a play by George Bernard Shaw, published in 1907. The few men who have ever been able to look evil in the face without illusion have been called cynics, says Shaw and he has created Andrew Undershaft, millionaire munitions maker to prove his point. Barbara Undershaft, a major in the Salvation Army, is conscientiously determined to save the immortal souls of the poverty-stricken inhabitants of London's slums. Her fiancé, Adolphus Cusins, sometime professor of Greek, has joined the Salvation Army only to save Barbara for himself. Andrew Undershaft, Barbara's father is a powerful munitions maker who has been separated from his family for many years at the time the play opens. To guarantee their children a private income for life, Lady Britomart, Barbara's mother, calls Andrew Undershaft to their home. When it is discovered that Andrew's money, considered tainted because it is earned by war and carnage, can buy even the services of the Salvation Army, Barbara resigns her commission. Adolphus Cusins is persuaded to become heir to the munitions business and Barbara marries him, hoping to do God's work for its own sake among the munitions workers. Shaw's central theme is that poverty is the greatest moral crime and truest evil in the world. "The crying need of the nation is not for better morals, cheaper bread, temperance . . . but simply for enough money," the author states in the preface. Andrew Undershaft has completely removed poverty as a threat to the lives of his employees; therefore he is moral. Barbara and Adolphus, who represent the purely intellectual type, are both made to see that man's soul is beyond salvation, that there are no adventitious aids to dignity, as long as there is poverty or the threat of poverty. It is impossible, according to Shaw, for man to care about ethical or political considerations on an empty stomach.

MAJORITY. See ELECTIONS; PRIMARY, DIRECT; PRIMARY, PRESIDENTIAL PREFERENCE; VOTE, VOTERS, VOTING.

MAJUBA, mä-jōō'bä, **HILL,** an eminence in the extreme north of Natal, about 7,000 feet above the sea, the scene of the defeat of 648 British troops, with the loss of their leader, Sir George Colley, by a superior force of Transvaal Boers, Feb. 27, 1881. The attack was unexpected, and the Boers found the British resting after a night march and a climb of eight hours. The loss of the Boers was about 130, of the British more than 200 in killed and prisoners, besides many wounded and some missing. To the British nation the name Majuba Hill became a synonym for disaster. The anniversary of this fight was marked by the success of Lord Roberts, commander of the British forces in the campaign of 1900, when he received the surrender of the Boer commander, General Cronje.

MAKAH (CAPE PEOPLE), Indian tribe of Cape Flattery, Puget Sound, Washington. They are the southernmost tribe of the Wakashan stock and the only one within the boundaries of the United States. They are of the Nootka branch. They claimed a considerable territory between Flattery Rocks and Hoko, but ceded to the government all these lands except that in the immediate vicinity of Cape Flattery in 1855. The Makah reservation was defined in 1873, and an added reservation for the use of the tribe was established in 1893 and is known as the Ozette.

MAKAROV, Stepan Osipovich, Russian vice-admiral: b. Kiev, Dec. 29, 1848, d. April 13, 1904. He entered the navy in 1864 and received rapid promotion for distinguished services. During the Russo-Turkish War 1877–1878, he commanded the gunboat *Grand Duke Constantine,* and for a series of daringly successful attacks upon Turkish ports, which earned him the title of "the Cossack of the Sea," he was promoted captain of the second rank, aide-de-camp to the late Czar Alexander II, was decorated with the orders of Saint Vladimir and Saint George and received a golden sword of honor. In 1881 he took part with the legion of Mikhail Dmitrievich Skobelev in the capture of Geok-Tepe in which Gen. Alekséi Nikolaevich Kuropatkin also figured prominently. The same year he commanded the cruiser *Taman,* the station guardship of the Russian embassy at Constantinople, and made a careful and complete study of the defenses of the Bosporus. After the disastrous attack of the Japanese on the Russian fleet at Port Arthur in February 1904 Makarov, then vice-admiral, was sent to the Far East to direct the Russian naval operations, and arrived at Dalny March 8. He repaired and converted the blockaded squadron into an active aggressive naval force, but on April 13 was lured out of harbor by a decoy squadron. Discovering the Japanese main fleet trying to intercept him he at once returned and was about to enter the har-

bor, when his flagship, the *Petropavlovsk,* was destroyed by one of the sunken mines laid by the Japanese across the passageway, and Makarov, his guest, Vasili Verestchagin (q.v.), the famous war artist, 16 staff officers and over 800 sailors perished.

MAKART, mäk'ärt, **Hans,** Austrian painter: b. Salzburg, May 28, 1840; d. Vienna, Oct. 3, 1884. He began his art studies in the Academy of Vienna. In 1859 he went to Munich, and painted in the studio of Piloty, under whose teaching (1861–65) he developed remarkable talent as a colorist. His earliest success was a Rembrandtesque picture of *Lavoisier in Jail* (1862). His first work to gain him wide fame was his three-paneled picture, *The Seven Deadly Sins* or *The Plague in Florence,* which aroused a storm of adverse criticism, wonder and admiration in Paris and Germany. In 1869 the Emperor Francis Joseph built him a fine studio in Vienna, and he produced his series of *Abundantia* pictures, *Fruits of the Earth; Fruits of the Sea.* In 1873 followed the picture which attracted so much attention in the Exhibition of Philadelphia (1876), his *Venice Doing Homage to Caterina Cornaro.* He traveled in the East during the winter (1875–1876), and his Egyptian sketches materialized in his *Cleopatra, Antique Hunt on the Nile,* etc. His *Entry of Charles V into Antwerp* (1875–1878) gained a medal at the Paris Exposition of 1878 and his *Diana's Hunting Party* is one of the most successful of his larger paintings, combining superb coloring and modeling of the nude with grand landscape effect. It is in the Metropolitan Museum of New York and is most characteristic of the gorgeous sensuousness of a painter who woke the intellectualists of German art to a sense of color, and broke free from the traditions of a somewhat stiff and pedantic method, gaining in life and intensity what he sacrificed of academic correctness.

MAKE-UP. The last two decades have seen make-up progress from its early category of woman's conceit to become an art and an integral part of feminine beauty and psychology. Chief credit for this about-face in the acceptance of widespread use of cosmetics should go to the motion picture industry, which set new standards of beauty and, through its motion picture studio laboratories and experimentation on the screen itself, brought new products and principles of application and use to the world's women.

Make-up as troop camouflage was an important part of World War II. Topflight make-up artists were drawn into the armed forces to put their skill to work in prosthesis. Today, make-up picks up where plastic surgery leaves off.

The war proved that make-up forms a part of feminine morale. In hard-pressed England, cosmetics were named a luxury. When, as an experiment, lipstick was again provided for women defense workers, output increased and women's whole general attitude changed.

The basic principles for the application of make-up as evolved for motion pictures remain the same for street, black and white and color motion pictures, stage, black and white and color portraiture, and 16-mm. photography. Television make-up alone deviated at first, but it now follows stage principles to a degree.

Street Make-up for Women.—The principles of corrective make-up are based on the classification of women's faces into seven different types: oval, square, round, triangle, oblong,

COLOR CHART

Skin	Foundation	Powder	Lipstick	Cheek rouge	Hair
Blonde light skin	Natural (very light)	Lightweight non-coloring	Light orange-red	Light orange-red	Light blonde
Blonde, medium skin	Faintly pink	Lightweight non-coloring	Pale strawberry	Pale strawberry	Medium blonde
Blonde, sallow skin	A light blue-red	Lightweight non-coloring	Light blue-red	Light blue-red	Dark blonde
Blonde, reddish skin	A peach buff	Lightweight non-coloring	True pepper red	True pepper red	Ash blonde
Blonde, dark skin	A warm copper	Lightweight non-coloring	Medium blue-red	Medium blue-red	Reddish blonde
Red head, light skin	A faintly pink or light blue-red	Lightweight non-coloring	Pale strawberry	Pale strawberry	Strawberry blonde
Red head, medium skin	A pale peach buff	Lightweight non-coloring	True pepper red	True pepper red	Copper blonde
Red head, sallow skin	A warm rose glow	Lightweight non-coloring	Medium blue-red	Medium blue-red	Medium red
Red head, reddish skin	A peach buff	Lightweight non-coloring	Medium blue-red or pale strawberry	Medium blue-red or pale strawberry	Light auburn
Red head, dark skin	A warm copper	Lightweight non-coloring	True pepper red	True pepper red	Light brown
Brunette, light skin	Faintly pink or a light blue-red	Lightweight non-coloring	Medium blue-red	Medium blue-red	Medium brown
Brunette, medium skin	A pale peach buff	Lightweight non-coloring	Medium blue-red or a pink-red	Medium blue-red or a pink-red	Dark brown
Brunette, sallow skin	A warm rose glow	Lightweight non-coloring	Medium blue-red	Medium blue-red	Henna brown
Brunette, reddish skin	A peach buff	Lightweight non-coloring	Medium blue-red or a pink-red	Medium blue-red or a pink-red	Black
Brunette, dark skin	A warm copper	Lightweight non-coloring	Deep blue-red	Deep blue-red	Dark gray
Gray, light skin	Light blue-red	Lightweight non-coloring	Light blue-red	Light blue-red	Medium gray
Gray, medium skin	Faintly pink or a warm rose glow	Lightweight non-coloring	A light blue-red	A light blue-red	Light gray
Gray, dark skin	A peach buff	Lightweight non-coloring	A pink-red	A pink-red	White

Note:—A peach buff foundation is particularly good for summer-to-winter transition on any type, and is flattering to ruddy, sallow or freckled skins.

inverted triangle, and diamond. In straight make-up the attempt is always to create the illusion of the perfect, oval contour. Cheek rouge is the greatest single factor in corrective street make-up, because it absorbs light. All make-up should be used in minimum, and no street make-up should ever appear obvious or blatant. Cosmetic items should be chosen to match skin tones and to complement the color of hair, eyes, and skin.

It is well for teen-age girls to remember that women in the middle twenties and upward use make-up only to achieve the appearance of fresh, youthful skin. The author does not approve of girls from 12 to 14 using other than a light coating of lipstick. From 14 to 16 they may augment this with a little powder and a very light application of cheek rouge for evening.

It is of great importance that women past 35 remember that as the years pass, their skin is undergoing a change, gradually becoming lighter. By the same token, they should begin to turn to the lighter shades of rouge and lipstick. Women in their sixties, for instance, are most flattered by a cameo-pink shade. Dark tones against a light skin are harsh and aging.

In preparing for application of a street make-up, the skin should first be cleansed with two applications of cleansing cream removed with tissue. Skin freshener should then be patted over the face with absorbent cotton. Freshener should not be allowed to remain on the face, but in turn should be patted off with tissue or a soft towel.

The choice of base make-up depends both upon the subject's age and skin type. For normal skins, choice is optional among cream foundations, liquid-cream, or lanolin cake. Cream foundation is best for dry skins, because it acts as a daytime lubricant. For oily skins, too, either a cream or liquid-cream foundation is advisable, because such bases allow normal oil excretion and absorb it. In overactive areas around the nostrils and on the chin when shininess becomes apparent, pressing those areas with tissue to remove excess oil and then repowdering keeps make-up looking perfect throughout the day.

The subject's choice of base is then applied in minimum, and the manufacturer's direction for use should be followed closely. The base should be smoothed over the face to form a thin, equally distributed film and should be carried over and under jaw and chin lines and blended out so that no line of demarcation is apparent. In application, an upward, outward circular motion, the fundamental massage movement, should be used. This same movement should be used in all cream applications and in washing face and neck, because it tends to keep tissue firm. Downward pulling movements weaken underlying tissue and promote sagging and wrinkles.

Next and probably the most important step in street make-up is the application of cheek rouge. There are two types: cream and dry rouge. Cream rouge should never be applied over a dry base, that is, cake. Dry rouge only should be used. Cream rouge should be used directly over cream and liquid-cream foundations *before powdering*. Dry rouge is used after powdering if it is found that insufficient cream rouge has been used. Application should be with a large art brush or powder brush, dusting the color on lightly over the same area originally covered with cream rouge.

Cheek rouge on the face should seem never to end. In other words, its use should be so subtle that it appears only as a faint, natural blush and no definite area of application should be apparent. The edges of the rouge area should be blended subtly into the surrounding foundation area by patting with the fingers. The value of cheek rouge as a corrective make-up item cannot be overemphasized. Because it forms a shadow and absorbs light, its proper use can camouflage a square face, add width to a thin face. (See Face Type illustrations.) Study of the average face and comparison with the Face Type illustrations will indicate to the individual the area of proper application.

Eyeshadow is applied sparingly on the center of the eyelids, and is blended outward to the corners of the eyes and upward to the eyebrow line. It should not be used on the inside corners of the eyelids next to the nose. Preferably, eyeshadow should be one of two natural shades, to match the eyes: blue-gray or brown. Any other shades, such as green or purple, destroy the natural appearance of the make-up.

Powder is an important finishing step in any make-up. If a base is used, the best choice is a lightweight, noncoloring foundation powder. This type does not add to or distort the color of the base. Being feather-light, its use does not provide a mask-like appearance. If no foundation make-up is used, a medium-weight, tinted powder should be used.

Whether or not a base is worn, powder should always be patted onto the face. Rubbing does not provide a smooth application. This is especially true when it is employed over any type of foundation. Powder should be used generously over the face, the patting procedure continuing until the base has absorbed as much powder as is necessary to "set" it. Excess powder is then removed with a powder brush, baby brush, or piece of absorbent cotton. A small, stiff-bristle brush should be used to remove powder from the eyebrows and around the hair line.

Eyebrow pencil should be used only when eyebrows are colorless or sparse, or when additional arching is needed. The pencil should never be used in a single, hard, continuous stroke. It should be sharpened to a flat point, and application should be with quick, short hairstrokes. After application, a small, stiff-bristle brush should be used to soften the outline.

Now if it is found that insufficient cream rouge was used, dry rouge is used to retouch the cheeks and is powdered over for smoothness.

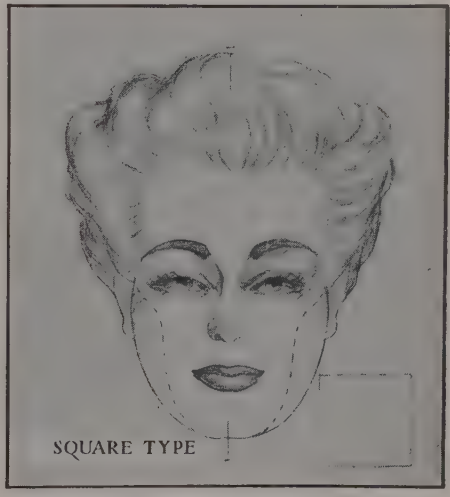
Proper application of lipstick is an art that should be practiced, because the mouth can so easily detract from or add to an illusion of beauty. Study of the face type illustrations will indicate correct mouth make-up according to type of face. In this manner, lipstick is used as a corrective cosmetic. Since the ideal mouth has perfect balance between upper and lower lips, the aim in employment of lipstick should be to camouflage too thin or too wide lips. This is done by drawing a new outline either above or below the normal lip outline. Lips should always be made up in a gradual curve. A mouth should never appear as a "cupid's bow" or as a wide splash of sulky color. Lips should be perfectly dry before application is started.

For the best results, a No. 5 art brush should be used as a dressing table brush during the initial make-up of the day. Once the correct outline of the lips is established, purse brushes

This type, with the forehead slightly wider than the chin, is considered the ideal. *Moist Rouge:* Apply in the center of the cheek, blend upward over the cheekbones toward the temple. *Lipstick:* Follow the natural lines of the mouth, retaining a full lip curve. *Eyebrows:* Retain a natural eyebrow line. Regardless of face type, the eyebrows should always start directly above the inside corners of the eyes. *Hair Style:* Retain the oval outline in coiffure; styling should be simple, with the hair drawn back from the forehead.

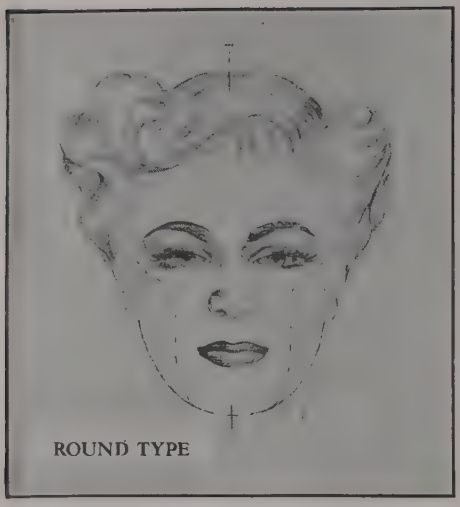
This type has a narrow forehead, high and wide cheekbones, and a narrow chin. *Moist Rouge:* Apply on the highest point of the cheekbone, blend carefully in a circular field. *Lipstick:* Gently curve the lips to moderate width, thereby adding an appearance of breadth across the lower part of the face. *Eyebrows:* Arch slightly. *Hair Style:* Keep fullness of hair above and below the ears. Hair should be combed back from, and dressed closely at a point even with the cheekbones. Use a short, diagonal part to give an appearance of greater forehead width.

This type has a wide forehead and a narrow chin line. *Moist Rouge:* Apply to the highest point of the cheekbone, carrying it upward toward the temple. *Lipstick:* Softly curve the upper lip; balance it with the lower lip for natural contour. *Eyebrows:* Retain the natural shape with a suggestion of an angle to disguise width of forehead. *Hair Style:* Retain simplicity on the crown. Begin fullness at a point above the ears and back of them. Greatest fullness should be even with the mouth line, making the lower part of the face appear wider.



This type has a straight hair line and a square jaw line. *Moist Rouge:* Apply in a circle under the eye's outer corner; blend toward the ear and down the jaw line very lightly to create a shadow on the lower face. *Lipstick:* Carry to the mouth's natural corners to reduce the width of the lower face. Curve the lips, with an upward tilt at the corners. *Eyebrows:* Arch slightly. *Hair Style:* Dress softly and loosely. An upward, balanced sweep from the temples minimizes squareness of features. Height is provided to add length to them.

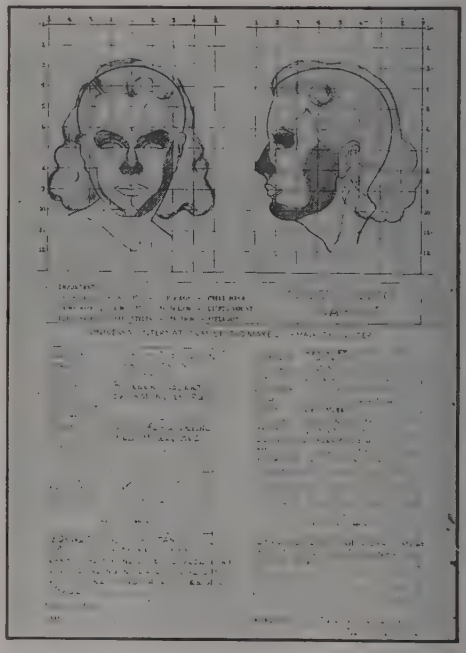
MAKE-UP



This type has a round hair line and a round chin. *Moist Rouge:* Use the darkest tone that blends with the complexion on the outer part of the cheek, carrying it toward the temples and down to shade the jaw faintly. *Lipstick:* Carry to the mouth's natural corners to reduce width across the lower face. Make up lips delicately with a natural curve. *Eyebrows:* Avoid a simple curve by arching subtly to a slight center angle. *Hair Style:* Avoid severity, and retain a soft outline at hair line. Create an illusion of length with a fullness above the ears.

A long, narrow face with hollow cheeks is characteristic of this type. *Moist Rouge:* Apply in a carefully blended circular area in the center of the cheek, avoiding cheek hollows. *Lipstick:* Retain a natural outline. The lower lip should remain full at the corners of the mouth. *Eyebrows:* Follow the natural, structural eyebrow line. *Hair Style:* Style hair closely to the top of the head to reduce length of features. Create fullness behind the ears on a line even with the mouth to provide an appearance of greater facial width.

This type has a narrow forehead, a wide jaw and chin line. *Moist Rouge:* Apply in a modified triangle, shading up to the temple and blending faintly over the jaw line. Rouge should cover the outer half of the cheek. *Lipstick:* Carry to the natural corners of the mouth, and use a gently curved, perfectly balanced lip line. *Eyebrows:* Counteract squareness with a gentle curve, natural in width. *Hair Style:* A soft, fringe bang makes the forehead seem wider. Bring it into balance with an upward sweep from the temples.



A chart made by a master make-up man during make-up tests for motion pictures. Indicating the areas for make-up and listing the proper types, it provides a key for future work.

MAKE-UP

GROTESQUE

Masculine Theatrical Make-Up: These four drawings illustrate the basic principles of masculine theatrical make-up for the professional or amateur theater. The same model was used for each sketch, demonstrating how one person can be made up for each of the four basic types: straight, character, elderly, and grotesque. Detailed instructions for applying make-up, and the requirements, will be found in a subsection of the accompanying article.

or the stick itself can be used throughout the day to renew color. The art brush should be balanced by placing the elbow of the brush-wielding hand on the dressing table and the little finger against the chin. Using the flat of the brush, application should begin at the center of the upper lip and the outline drawn in a gradual curve to end *just before the corner of the mouth is reached.* This should be a continuous, hard stroke. When the upper lip has been completed, the flat of the brush is again employed on the lower lip, starting at the extreme corners of the mouth and drawing toward the center of the lip. On both upper and lower lips, if any outline irregularity is noticeable, the tip of the brush may be employed for final correction. The purpose of ending the upper lip outline within the actual corners of the mouth is to prevent a drooping line.

Upon completion of application, tissue should be placed between the lips; then should be pressed against the lips to remove excess color. The latter process should be continued until color fails to leave a tissue impression. When lips are too wide for beauty, foundation should be carried over the normal outline and powdered over as with the remainder of the face. This disguises normal outline, and lip rouge is employed in a corrective outline.

Mascara is the last step in a street make-up. It is preferable in most instances to apply it only to the tips of the upper lashes. If the eyes are inclined to be close together, it is applied only from the center of the eyes outward to the corners on both upper and lower lids.

Motion Picture Make-up.—*Black and White Photography.*—The actual steps in make-up and cosmetics used, with exceptions of cream rouge and shades of foundation, remain identical with those outlined for street make-up. Because cheek rouge creates a dark shadow in black and white screen photography, no cream rouge is used. When a feminine star's make-up is completed, a very light dusting of dry rouge is made simply for mental "lift." The amount of make-up used is comparatively the same as used for a good evening make-up.

Corrective make-up application is based on the premise that shadow absorbs light; highlights reflect light. Thus, to minimize any structural prominence a dark foundation would be used; to bring structural weakness into relief, a light foundation, or highlight, would be used. In the examples which follow, a shadow is a color three to five shades darker than the overall base color, and is applied before the highlight. A highlight is three to five shades lighter than the overall base and is applied after the shadows and before moist rouge and powder. (For corrective street make-up, highlight is one to two shades lighter than overall base; shadow, one to two shades darker.)

If a chin has a tendency to recede, we use a foundation three shades lighter than that used on the remainder of the face. Where the two shades meet, they are blended expertly together by patting with the fingertips. Creation of such highlight on the chin brings it into a stronger relief. A sagging, double, or prominent chin is disguised with use of a dark foundation.

When a protruding forehead is a problem, we choose a foundation three shades darker than that used on the remainder of the face, follow the same blending process. The darker foundation becomes a shadow, accepts light, thereby minimizing forehead prominence.

In contradiction to the foregoing use of shadow, a darker foundation is never used on a large, prominent nose. Use of shadow in such a manner would appear as discoloration. The size of the nose is minimized by using a lighter foundation on the cheeks at the sides of the nose, blending it off across the upper lip immediately under the nostrils. The nose itself and the remainder of the face are made up with a foundation cream that matches the normal skin tone, creating an illusion of fullness in the cheeks to minimize the nose. If a nose is short and flat, then a lighter foundation cream is used from the point between the eyes, straight down the bridge to end at the nose tip.

When the greater prominence lies in the cheekbones, a dark foundation is used over the cheekbones, a light foundation in the hollows of the cheeks and the recessions at the temples. The remainder of the face is made up with foundation matching normal skin tone.

These examples best explain the principles of corrective make-up and the use of highlights and shadows.

In the creation of a straight character make-up for the screen, where latex (sponge rubber) is not used to change facial structure, the subject's face is treated as an artist's canvas. An overall base, or primer (regular man's or woman's base color), is first applied to face and neck. Using artists flat sable brushes, numbers ranging from 1 to 20, highlight and shadows are applied in broad brush strokes, and are then blended with the fingertips. Wrinkles are accentuated with pencil. To promote an appearance of age on the mouth, base is carried over the lips, and pencil is used to stress normal lip wrinkles. Hair whitener is used to age eyebrows and temples. If a white head of hair is desired, a wig is used.

To create an age make-up, all hollows, crevices, and lines of expression are first covered with a dark brown foundation. When this procedure is finished, the face should somewhat resemble a skull. The subject's forehead is then forced into the deepest possible wrinkles, and all foundation is carefully wiped off the mounds of the wrinkles. As a result, the brown base is retained in the wrinkle crevices. Next, the subject squints one eye to obtain the deepest possible corner wrinkles, then the other, and the same procedure outlined above is followed. Then the lips are pursed, and the same method is followed on the wrinkled area surrounding the mouth. With completion of the mouth, all wrinkles and natural expression lines are accentuated.

Choice of shade for overall foundation would be dependent on the character to be portrayed. If a ruddy skin is characteristic, then a dark basic color (two shades lighter than wrinkle base) would be used; if pale, a lighter shade of overall base. Overall base should not be used in the shadow areas, such as temples and cheek hollows.

Shadow work now comes into play. In the wrinkling process, dark brown foundation was used in all hollows, including temples and cheeks. These same areas are now retraced with shadow. Care should be taken not to disturb the original application. Shadow placement is at the temple line, inside corners of the eyelids, down the outside planes of the nose, and from the nostrils to

the outside corners of the mouth. For extreme gauntness, shadow is applied in the cheek hollows.

Highlights follow shadows. Previously applied foundation is retraced with highlight; when it crowds onto the wrinkle areas, the wrinkling process should be repeated so as not to destroy previous work. Highlight coloring should be applied to all protruding points of the head's bone structure, that is, frontal forehead bones, nose bridge, cheekbones, nostril sidewalls.

Eyeshadow should be used only in the inside corners of the eyelids. On men, red foundation is used on the lower eyelid ledge, but is not extended beyond the outer corner of the eye. On women, no lining of any kind is used.

For powdering, use plain talc and repeat the entire wrinkling process while powdering. Excess powder is removed with a powder brush.

On men, no lip rouge is used; on women, very little is used, and the lower lip is thinned and the corners droop.

Hair whitener is used on eyebrows to conform with hair. No mascara is used and powder is allowed to remain in the lashes.

To age the neck, chin and neck are stretched backwards, and shadow is applied on either side of the neck cords. After shadowing, highlight is applied to the mounds of the cords. The chin is then dropped, and revealing lines or wrinkles are traced with brown pencil, and the mounds of the wrinkles highlighted.

In straight make-ups, no hand make-up is used unless the general make-up is very dark or very light. Hands should then be made up to match the face, because dramatic action often brings hands into play close to the face. To age hands, shadows are created between the sinews and veins. Hands are hung in a drooping position until the veins are outlined, and blue shadow is then used on the veins proper and between the sinews. The hands are then closed into fists, the tops of the knuckles highlighted, and from the ends of the fingers, a highlight is carried back to the wrist, accentuating sinews and cords of each finger. No overall base is used.

Historical character portrayals or extreme old age make-ups (Agnes Moorehead in *Lost Moment*), where change of bone structure is needed for the first and sagging and loose tissue for the latter, are handled with the use of latex (sponge rubber), otherwise called appliance make-ups. Appliance make-ups are very effective, but they are prohibitive from the standpoint of cost to the layman. Not only does their employment demand a complete laboratory set-up, but the formulas themselves are secret, varying with various requirements.

Make-up as such, however, is applied in exactly the same way over rubber as described in the foregoing. It is also the same make-up, with the exception of the base. Known as rubber grease, it is an evaporated oil base, necessary because any regular oil base discolors and deteriorates rubber.

Color Photography.—Continued experimentation with color film has necessarily brought about some changes in make-up principles. Where formerly the basic tone for a screen color make-up was light gray, the basic tone now is a light gray-green which is warmed with the desired shades through the use of primary mixing colors. The mix is according to part requirements and the story setting. For instance, if it is an outdoor picture, men's make-up would have a tendency to be on the brown side. Bases for women are brought up to the desired pink tone, dependent on individual coloring, although if it is an indoor, or drawing-room type of picture, the mix has a pinker tone. Only pre-picture testing can prove or disprove a correct color make-up.

The amount of corrective work done for color motion pictures is held at a minimum. While the principles remain the same, shadows and highlights must be handled much more subtly. Very little shadowing is done, and any highlights or shadow used are mixed with the base color so that only a suggestion of their use remains after application. Great pains are taken in blending highlights and shadows, since absolutely no hint of demarcation can remain. By the same token, any latex appliances used must be extremely subtle.

All color make-up is applied in absolute minimum, a straight make-up for women, for instance, utilizing only about half the amount of that customarily used for a street make-up. For women, both moist rouge and dry rouge are used, the former directly over the base and before powder; the latter after powder. Moist cheek rouge is first mixed with base color to avoid a "hot" rouge color. Matching colors in lipstick and cheek rouge are of the greatest importance, and those used for women are on the cameo-pink side because of the intensification of red in photography.

No cheek rouge is employed on men, and any lipstick is on the brown side. Applied very lightly, it is wiped off, the very limited residue serving to provide a faint definition.

Brown eyebrow pencil is used. All desired depth is acquired with brown. The use of black pencil results in an undesirable harshness. Mascara, too, is preferably brown, although sometimes there is occasion to use a dark brown shade on a very dark brunette.

Powder must be neutral (foundation powder) so that color value of base tones, highlights or shadows is not changed.

Stage Make-up.—Basic principles of application remain the same as for black and white photography. However, because at a distance of 40 feet a performer's face loses audience perspective, stage make-up must exaggerate the essential features.

Stage lighting is extremely important in judging stage make-up. A straw-colored light will dull blue and pink; blue light changes rouge to purple and deadens pink and yellow; a light pink spotlight on an actor's face will intensify all pink and red tints in his make-up, and tend to wash out the yellows and blues. Stage make-up, therefore, is better inspected under actual stage illumination than under dressing room lights.

The liquid and paste bases used for stage make-up run from flesh color through healthy sunburn for juvenile men; for older men, flesh through the lighter sallow shades. Standard for young leading ladies is peaches-and-cream, and a light sallow for older women.

Shadows range from dark through light brown; dark through light gray; medium blue through light gray and blue-gray. Both eyebrow pencil and mascara are black.

Powder, with the exception of character make-up requirements, should match the overall base color. For character make-up, base-colored powder is mixed in the proportion of one-third base color to two-thirds plain talc. Such a mix-

ture effectively reveals all highlight, shadow, or corrective work that has been done. For extreme old age, plain white talc is used. Because it is transparent, it not only reveals highlight and shadow work, but adds the white appearance of aged skin.

Adhesives in use include gutta percha, spirit gum, and resin, the last diluted with alcohol. These are used to fasten on wigs, moustaches, and beards, where hair is already on a piece. Nonflexible collodion is used over fish skin to create scars. Flexible collodion (collodion with 20 per cent castor oil mixed) can be used over cotton, before the base color, to provide a firm surface for a necessary change of facial contour. Application before foundation prevents base make-up absorption and allows retention of the modeled shade. Neither collodion nor nonflexible collodion should be applied directly to the skin. Rubber liquid adhesive can be used with cotton modelings. It is applied directly on the skin to hold the cotton, as well as on the cotton before application of the flexible collodion.

Feminine Stage Make-Up.—The basic role of stage make-up is to exaggerate the essential features of the character to be portrayed. The treatment of the hair and the selection of the costume, naturally, contribute tellingly to the final effect. The following instructions apply to the illustrations accompanying this article, on which are shown examples of the four basic types of feminine stage make-up: straight, character, elderly and grotesque.

Straight.—(1) Overall base: liquid pink (peaches-and-cream) applied sparingly to the exposed areas, the eyelids, neck and ears, inside and out.

(2) Shadow: Two shades darker than the base.

(3) Highlights: Two shades lighter than the base. If, however, the shadows and highlights are used for corrective purposes, apply them sparingly and blend them into the overall base, leaving no line of demarcation.

(4) Eye shadow: Blue-gray, green or brown. Apply over the base before powdering, but use only enough to define the color, about three times as heavy as used for the street.

(5) Eye liner: Black pencil. Use to line the eye at the upper lash line, extending the line a quarter of an inch beyond the outer corner of the eye. Line the lower lash line, starting at a point below the middle of the eye and extending a quarter of an inch beyond the corner, leaving a quarter-inch space between the upper and lower black lines. Blend with a small dry brush. Apply white foundation (clown white) with a make-up stump on the ledge of the lower eyelid, and extend it beyond the corner of the eye into the space between the upper and lower black lines. The eyes will then retain an "open" appearance.

(6) Cheek rouge: Very bright. Smile, and place moist rouge on the high point of the smiling cheek, as indicated in the illustration. Carefully blend the rouge under the outside corner of the eye up into the temple area and downward onto the lower cheek. Use three times the amount used for the street.

(7) Powder: Pat peaches-and-cream powder generously over the entire area and brush away the excess. Remove the surplus from the eyelids with absorbent cotton.

(8) Mascara and evebrow pencil: Black, no matter what the individual's coloring. If the hair coloring is very light, apply very lightly. If the eyes are small, use mascara only on the tips of the lashes. The eyebrow should never be higher above the eye than the normal opening of the eye itself.

(9) Lip rouge: Very bright. The mouth should be sharply defined and made up with full, round and curved lines. The corners should turn upward.

Character.—Character make-up is really a matter of portrait painting; a new personality is painted over the performer's face. As in the case of the Chinese make-up which is illustrated, a photograph or other likeness is obtained and a duplicate painted on the face. The placement of rouge and the treatment of the eyes and eyebrows in the illustration should be carefully noted. Black liner is drawn from the inner corner of the eye over the upper lid to end in an upward tilt about half an inch from the outer corner. The lower lid is lined in the same fashion, with the points of the lining meeting at both inner and outer corners to achieve an olive shape. One half of the normal eyebrow is covered with overall foundation and a thin, slanting brow, drawn in with black pencil, replaces it.

Elderly.—(1) Base for wrinkles: Dark brown. First cover all hollows, crevices and lines of expression with a dark brown foundation. Then wrinkle the forehead and wipe the foundation off the mounds of the wrinkles so that the brown color is retained in the crevices. Next, squint one eye and then the other to the fullest extent, and purse the lips, following the same procedure around the mouth.

(2) Hair whitener: Use this for graying or whitening hair. (A wig is used in the illustration.)

(3) Overall base: Peaches-and-cream, or lighter, according to character. The overall base should not be used in shadow areas (see illustration), such as temples and cheek hollows.

(4) Shadow: Light brown. In applying the base for wrinkles, dark brown is used in all hollows, including the temples and cheeks. These areas should be retraced with shadow, using care not to disturb the earlier application. Shadows are placed at the temple line, on the inside corners of the eyelids, down the nose planes, and from the nostrils to the outer corners of the mouth. If an extreme gauntness is desired, shadow should be placed in the cheek hollows.

(5) Highlights: These should be practically white. Retrace over the overall base previously applied, giving highlight coloring to all protruding points of the head's bone structure, such as the frontal bones of the forehead, the cheekbones, the bridge of the nose, and the walls along the sides of the nostrils.

(6) Eye shadow: Blue-gray or gray. Apply only in the inside corners of the eyelids. The outside bulge of the upper lid is highlighted to give an appearance of heaviness.

(7) Cheek rouge: Pale, or omitted, according to character.

(8) Powder: Plain talc. The wrinkling process must be repeated when powdering.

(9) Lip rouge: A minimum is used. The lower lip is thinned more than in a younger character and the corners droop.

Hair whitener may be used on the eyebrows, as in the illustration, to conform with the hair.

In cases of extreme make-up, the overall foundation is applied to the eyebrows. Any powder should be allowed to remain in the lashes. No mascara or eye liner is used.

Grotesque.—Following a portrait-painting procedure, extreme use of highlight and shadow is made deliberately, applied with a brush over the basic foundation. The center area of the brush stroke must retain the full density of color. At the edges, however, shadow or highlight become a part of the overall foundation, being carefully blended with the finger tips to avoid any line of demarcation. The mouth contour is further changed by the use of lip rouge, as in the illustration. In the creation of a scar, fishskin is used as a base to prevent burning the skin, and is applied before the make-up. After determining the scar area, cut the fishskin one inch wider and longer than the scar. Tear the edges carefully to blend with the skin and affix with spirit gum. After it is placed, create the desired scar on the fishskin with nonflexible collodion.

Masculine Stage Make-Up.—The following instructions apply to the illustrations accompanying this article, on which are shown examples of the four basic types of masculine stage make-up: straight, character, elderly and grotesque. References below apply to the preceding subsection of this article, *Feminine Stage Make-Up.*

Straight.—(1) Overall base: A healthy tan. Apply sparingly to the exposed areas, the eyelids, the neck and back of neck, and the ears, inside and out.

(2) Shadow: Two shades darker than base.

(3) Highlights: Two shades lighter than base. If, however, the shadows and highlights are used for corrective purposes, apply them sparingly and blend them into the overall base, leaving no line of demarcation.

(4) Eye shadow: Dark brown on blonds and black on brunets. It is used to create contrast for the whites of the eyes. Apply sparingly, with full density at the upper lash line. It must be blended with the base color at the upper limit of the eyeball.

(5) Eye liner: Use black lining pencil. Follow procedure outlined for feminine straight make-up.

(6) Cheek rouge: Rust color. In applying, start at the high point of the cheekbone and blend carefully down over the jaw line. Avoid a harlequin look. Use three times the amount of color used for a woman's street make-up.

(7) Powder: A healthy tan. Apply generously, brushing off the excess. Remove the surplus from the eyelids with absorbent cotton.

(8) Mascara and eyebrow pencil: Black mascara may be brushed both on lashes and eyebrows, or a brown or black eyebrow pencil may be used to emphasize the eyebrows. Angular eyebrows give an impression of dramatic masculinity.

(9) Lip rouge: Very dark. Men seldom need lip rouge for the stage. When necessary, a very dark shade should be used to indicate the desired shape and then wiped off, leaving only a faint trace. Too much lip rouge on a man can defeat an entire characterization.

(10) Dry cheek rouge: A small amount of rust-colored rouge should be used over the powder to retrace the moist rouge area.

Character.—Follow the feminine character make-up procedure, noting the shadow and highlight work on the accompanying illustration.

For artificial beards and mustaches, use crepe hair, which comes in variously colored braids. The complete make-up is applied over all areas of the face, except those where the artificial hair is to be used, before the beard or mustache is applied. Paint the hair area with spirit gum and allow it to dry. Pull the prepared crepe hair together in a point, paint the hair area with a second coat of spirit gum, and affix the hair. When the spirit gum has set firmly, comb the hair together and trim with scissors to the desired contour. The same method is used for applying eyebrows or in changing the front hairline. Crepe hair may be whitened just like natural hair.

Elderly.—(1) Base for wrinkles: Dark brown. Follow the feminine elderly make-up procedure.

(2) Hair whitener: Use for graying or whitening hair. The older the character, the further over the hair should be parted.

(3) Overall base: This depends on the character to be played. If a ruddy skin is desired, a dark basic color two shades lighter than the wrinkle base should be used. For a pale skin use a lighter shade of overall base. The overall base should not be used in shadow areas, such as the temples and cheek hollows.

(4) Shadow: Two shades darker than the overall base. Follow the feminine elderly make-up procedure.

(5) Highlights: Two shades lighter than the overall base. Follow the procedure outlined for feminine elderly make-up.

(6) Eye shadow: The same color as the overall base, or darker, depending on the character. It should be used only on the inside corners of the lids.

(7) Cheek rouge: Very light, or none, depending on the character. If used, dry rouge should be applied only to the high point of the cheek, after powdering.

(8) Powder: Use a plain talc. Repeat the entire wrinkling process when powdering.

(9) Tooth enamel: Black tooth enamel may be used to black out teeth. To fill or match teeth in exact color, apply white tooth enamel and allow it to dry.

No eye liner is used. A red foundation should be used on the lower eye ledge, extending no further than the corner of the eye. No mascara or eyebrow pencil is used. Apply hair whitener to the eyebrows. Allow powder to remain on the lashes. No lip rouge is used; the overall base should be carried over the lips.

Grotesque.—Follow the feminine grotesque make-up, noting the extreme use of shadow and highlight on the accompanying illustration. The sketch there is that of a prize fighter. The change in nose shape is accomplished by the use of cotton and collodion. Before any other make-up is applied, spread a thin coat of spirit gum on the nose area. Place small pieces of cotton on the bridge of the nose and build the new shape. Brush the edges with spirit gum. After the desired shape has been obtained, cover the entire area of cotton with flexible collodion, extending the collodion a quarter of an inch beyond the edges of the cotton to make it secure. Allow the collodion to dry between the applications. The drying may be hastened with a fan or blower. Before applying the base foundation, add a quarter-ounce of base foundation to a quarter-ounce of flexible collodion, mix

thoroughly, and apply over the entire area of cotton, remaining an eighth of an inch inside the margin line of the original spirit gum application. This will bind the edges of the applied spirit gum, cotton and collodion.

The process just described is not, however, as permanent as the use of nose putty which is manufactured in several colors to match the foundation make-up. Warmed to body temperature in the hand, it is modeled on the nose. The putty adheres to the flesh, and make-up is applied directly to it.

To achieve a cauliflower ear, bend a hairpin around the ear to hold it in the desired position, then cover it with adhesive tape. Create the necessary contours with spirit gum and cotton. Cover with a single coat of collodion and apply the foundation to all surfaces.

Television Make-up.—Just as continued developments in color film and photographic technique take place, and make-up is altered to meet those changes, just so are the rules for television make-up elastic. For, as television itself is still in a highly experimental stage so, too, is make-up.

At the present writing (1949), the most successful television make-up is that which closely follows stage principles: intensification of color and exaggeration of essential features. Shadow for television is two shades darker than base color; highlight, two shades lighter.

Because red is burned out and becomes a highlight, only a light dusting of cheek rouge is permissible after powdering. Here again, as in black and white motion picture work, it is used for psychological effect only.

Lip rouge for women is a garnet shade. After initial application it is powdered, excess powder removed, and lipstick again applied. This is to avoid any shine or glow. Lipstick, if used for men, is on the brown side, as for stage use, and is wiped off to leave only faint definition.

Overall base for men is a dark tan; shadow, a dark brown. For masculine leads, shadow work consists usually only of under-chin work or along the sides of the nose. Overall base for women is a light tan. These bases are on the true brown side, with an avoidance of pink or definite red tones. Television lighting washes out red, thereby resulting in glaring highlight.

Powder matches overall base. As with stage make-up, both eyebrow pencil and mascara are black for greater definition.

Photographic Make-up: Amateur and Professional.—For 16-mm. use, the make-up procedure as outlined for black and white motion pictures is correct. If in color, the best possible make-up is that designated for street, with the exception of cheek rouge and lipstick. In color, these should be two shades lighter than that customarily worn by the subject for street.

The most important single make-up item, photographically speaking, is the base. Not only is it flattering to the subject, but its use saves hours of retouching. Base color is that used ordinarily by the model for street. Exceptions are platinum or bleached blondes, when skin and hair tones are so often similar that definition is lacking. The same is often true of brunettes with olive skins. For blondes who pose this problem, foundation liquid or cream should be at least two shades darker than that used for street; for brunettes, one shade lighter.

In black and white still photography, Hollywood photographers often skip the use of powder if a subject's skin is unblemished and freckles are not too apparent. They use only cream or liquid foundation without powder. The result is lustrous, highlighted skin, with normal skin texture showing through.

For color stills or home movies, eyeshadow should be used very sparingly. If brown is used, it should be mixed with a little of the base, using only enough base color to bring the eyeshadow down to a smooth tan instead of brown. After mixing, it should be two shades lighter than in its original form. Blue-gray shadow should not be mixed.

For black and white portraiture, the subject should pass the tip of the tongue lightly over both upper and lower lips before each shot. The result is the nice lip hilations seen in Hollywood portraiture. Interesting hilations on bare shoulders are achieved by smoothing on a very little cold cream or vaseline, then toning it down with tissue.

If a bathing suit model has an even, overall tan, it can be effectively highlighted by covering it with an application of baby oil and removing the excess with tissue.

Hairstyling.—The importance of feminine hairstyling cannot go unrecognized, for by following the general rules laid out for hairstyling for the seven face types, women not only minimize faults but emphasize good points. Hair is the frame for the face, and correct balance is the secret of fine hairstyling. No matter how perfect the make-up, if hair is incorrectly or unbecomingly styled the illusion of beauty is destroyed.

BUD WESTMORE,
Director of Make-up and Hairstyling, Universal International Studios.

AND

BERTHA JANCKE,
Publicity Director, The House of Westmore.

MALABAR, măl'ă-băr, district, Republic of India, State of Madras, bordering on the Arabian Sea, 5,790 square miles in area. Calicut is the capital. Together with the southern group of the Laccadive Islands, pop. (1941) 3,929,425.

MALACCA, mă-lăk'ă, British Malaya, a Settlement of the Federation of Malaya, in the southwest of the Malay Peninsula, 640 square miles in area. The capital and seaport is Malacca (pop., 1947, 54,507), on the Strait of Malacca 118 miles by sea from Singapore. Rubber and coconuts are extensively cultivated. Refugees from the Sumatran kingdom of Srivijaya fled in the 14th century to the small fishing village of Malacca which, within 100 years, grew to become the capital of an influential kingdom. It fell to the Portuguese in 1511 and was captured by the Dutch in 1641. Malacca was held by the British 1795–1802 and 1811–1818, and was ceded to them in 1824. Until 1948 it was one of the Straits Settlements. Pop. (1948) 244,582.

MALACHI, Book of. The book is perhaps actually anonymous. The author's name appears only in 1:1, which is very probably an editorial addition. The word Malachi means "My Messenger," and may have been taken from 3:1.

There is no serious question affecting the authorship of more than a few verses of the book. It has often been thought that 2:11 following, expresses a spirit of narrow Judaism which is

inconsistent with i, 11. This is so upon one interpretation of the latter passage which makes it refer to the turning of the nations to Yahweh either in the present or the future. That, however, is probably not the correct interpretation. The verse in the context, particularly in relation to the following verse, seems to be clearly present and not future. At present it is not susceptible of the broader meaning given; that could not have been true at any probable time of writing. Hence the probable meaning is rather that worship is offered by Jews who are scattered widely among the nations; the reference is to the faithfulness of the Jews of the diaspora. Thus understood it is not inconsistent with ii, 11f.

Verses 4–6, chap. iv, are quite certainly a later addition. Verse 4 is a legal gloss, quite different from anything else in the book; verses 5–6 are a gloss upon verses 1–3, a restatement of much the same idea but from a different standpoint, one that is out of harmony with the book.

The mention of Edom, i, 2–4, gives a general indication concerning the date of the book. These verses indicate some recent crushing disaster to Edom, which is narrated in a spirit of hatred to Edom. This hatred began, the history shows, with the treacherous violence of Edom at the destruction of Jerusalem in 586. The disaster here referred to was doubtless one that came from the invasion of the Nabateans, and might have taken place at any time during a considerable period before 312 B.C. The general time between 586 and 312 is thus indicated. The temple had been rebuilt after the exile, i, 10; iii, 1, 10, and the enthusiasm of the time of its rebuilding had passed away. This indicates a time considerably after 516 B.C. The general condition of the people is that of the time of Ezra and Nehemiah, with the temple service in disorder and disrepute, i, 6–8, 12–13; ii, 1, 8, 17; iii, 7–10, 14, see Nehemiah x, 32–39; xiii, 10–13. Also, the divorce of Jewish wives and the marrying of foreign wives were found frequently, ii, 10–16, see Ezra, ix-x; Nehemiah x, 28–30; xiii, 23–31. There is in the book, however, no reference to the work of Ezra and Nehemiah. Hence the book is to be assigned to the period before their activity, and presumably not long before, perhaps about 460 B.C.

The message of Malachi was intended to be primarily one of encouragement to the discouraged people in Palestine. The principal comprehensive thought of the book is that Yahweh still loves Israel, in spite of appearances to the contrary. This is stated at the beginning of the book, in i, 2–5. The reason assigned for the adverse conditions from which the people were suffering was the failure of the people to do their duty toward Yahweh. This was particularly a failure in relation to the outward national service. The outlook of the prophet is, therefore, in a considerable measure, formal. Yet this formal side is accompanied by a real ethical interest, as appears in ii, 27. A high standard for priestly activity is set up in ii, 7. The assurance of further prosperity for the people if they amend their ways is in connection with the coming of the day of Yahweh.

Professor Emeritus of Old Testament Interpretation and Semitic Languages, Colgate Univ.

MALACHITE, a native basic copper carbonate and hydrate, having the composition $CuCo_3.Cu(OH)_2$, crystallizing in the monoclinic system, but commonly occurring in massive form, or as an incrustation. It is brittle and has a specific gravity of about 4, and a hardness of from 3.5 to 4. Malachite is commonly subtranslucent, with an adamantine lustre. It is beautifully green in color, often banded with other colors and it occurs in many parts of the world, usually in connection with other ores of copper. Specially fine pieces are found in the Ural district, and at the Nizhne Tagilsk copper mines a deposit is known which contains at least half a million pounds of pure malachite. In the United States, the best-known deposits are those of Arizona. Malachite has been much prized as a gem stone and it is extensively used for panels, clock cases, table tops and other ornamental work.

MALACHY, Saint, Irish bishop: b. Armagh about 1094; d. Clairvaux, France, 1148. He belonged to the noble family of O'Morgair, was educated by Iombar, an anchorite, and ordained priest in 1119. He afterward studied at Lismore, and returning to Armagh was chosen bishop of Down and Connor (1125). His subsequent election to Armagh having been disputed (1129) he eventually, after a satisfactory settlement of the disputed questions and in accordance with his own desire, returned to the less important diocese, where he labored to secure for the Church a stronger foothold. In 1139 he set out on a mission to Rome. On his way thither he visited at Clairvaux and there began a lifelong friendship with Saint Bernard. He was commissioned in 1148 to go to Rome a second time, but was stricken on the journey and the last moments of his life were spent with Saint Bernard, at whose monastery he had stopped. He was a zealous reformer and to him is given the distinction of having opened the first Cistercian monastery in Ireland. The document known as 'Prophecy of Saint Malachy,' containing a Latin motto for each of the popes, is now considered not to be his production. He was canonized in 1190. Consult O'Hanlon, 'Life of Saint Malachy' (1859); Migne, J. P., 'Patrologia Latina' (Vols. CLXXXII, CLXXXIII).

MALACOLOGY. See MOLLUSCA.

MALACOPTERYGII, măl-a-kŏp-tē-rĭj'ĭ-ī, or **MALACOPTERI,** a group of fishes, in former systems of classification, including those with jointed and spineless or "soft" fin-rays. Compare ACANTHOPTERYGII; and see ICHTHYOLOGY.

MALACOSTRACA, one of the two primary divisions of the *Crustacea* to which all of the larger and more highly organized forms belong. The number of pairs of appendages and of segments is definite, the former being always 19 and the latter 19, except in the order *Leptostraca* which have also two abdominal

segments limbless. The boundary between head and thorax is not always clearly defined but the two always comprise 13 segments, of which five almost always belong to the head; the abdomen has six limb-bearing segments and is terminated by the telson which is probably a seventh segment. The head bears a pair of eyes, usually stalked, two pairs of antennae, a pair of crushing jaws or mandibles and two pairs of maxillae, to which a pair of maxillipeds is sometimes added (*Arthrostraca*). Of the typically eight thoracic segments from one to three bear maxillipeds and the remainder walking feet. In most cases the thorax is more or less completely covered by a carapace. The mode of development is varied, sometimes, as in the crayfish, it is direct, sometimes with a nauplius, but usually through the larval form called zoaea (see LARVA), which possesses paired eyes as well as a median eye, a swimming tail and usually seven pairs of appendages. The subdivisions are:

Order *Leptostraca* (*Nebalia*).
Order *Arthrostraca* { *Amphipoda* (beach fleas). *Isopoda* (wood lice).
Order *Thoracostraca* { *Cumacea* (*Diastylis*). *Stomatopoda* (*Squilla*). *Schizopoda* (*Mysis*). *Decapoda* { *Macrura* (lobsters and shrimps). *Brachyura* (crabs).

See CRUSTACEA.

MALADE IMAGINAIRE, mä-läd ē-mäzhē-nār, **Le,** a comedy in five acts by Molière. It was produced in Paris (1673), was the last work of its author and the last in which, as Argan, he appeared on the stage. See MOLIÈRE.

MALAGA, mäl'ä-ga (Sp. mä'lä-gä, ancient MALACA), Spain, capital of the province of Málaga, on a small arm of the Mediterranean, about 65 miles northeast of Gibraltar. It was a Phoenician and afterward a Carthaginian colony, was a flourishing city under the Romans and its long occupation by the Moors has left distinct marks in the older parts of the town; the Gibralfaro, or Moorish castle, on a hill overlooking the town, and considerable portions of the ancient fortifications, yet remain. Among the important buildings are the cathedral, a highly decorated structure in the composite style with a spire 300 feet high; the episcopal palace, customhouse and several hospitals and charitable institutions. The manufactures consist chiefly of iron, the ore of which is obtained from rich mines in the vicinity; soap, cottons, linens, and machinery. Wonderful gardens lie outside the town, like the Haciendas de la Concepción and De San José, where marvelous effects are produced by carefully tended sub-tropical vegetation. Along the coast in the direction of Vélez-Málaga are ancient Moorish watch-towers, used, after the fall of Granada, against the Moors themselves, who often descended upon the coast to plunder and destroy. The harbor is excellent and the trade is of importance, the principal exports being olive oil, lead in bars, wine and fruit, particularly raisins, grapes, oranges and almonds. There used to be a great export of raisins to the United States, the consumption of which, however, declined in favor of the California product. The climate, mild, dry and equable, makes Málaga one of the finest resorts for invalids in Europe. Pop. (1941 est.) 238,264.

MALAGA WINE, a sweet Spanish wine produced in the province of Málaga. It is one of the "muscatel" wines, and is rich, luscious and full of body. See WINE AND WINE-MAKING.

MALAGASY SUBREGION, a faunal division of the Ethiopian region in zoogeography which embraces Madagascar and some small neighboring islands. See MADAGASCAR; ZOOGEOGRAPHY.

MALAKHOV, or **MALAKOFF,** măl'ä-kôf. See SEVASTOPOL.

MALAMPAYA, mä-läm-pä'yä, a sound on the northwest coast of the province of Paragua, island of Palawan, Philippines; it is an arm of the China Sea, extending 24 miles northwest to southeast, and from three to six miles wide. It is entirely landlocked, Tuluran Island protecting it from the China Sea, and is entered by Blockade and Endeavor straits. Its depth varies from 36 to 54 feet, it is free from sunken dangers to navigation, and is one of the finest harbors in the Philippine Archipelago.

MALAPROP, Mrs., a character in the *Rivals* of Sheridan. Like Shakespeare's Dogberry she is made to employ words of the same length, accent and more or less similar vowel and consonantal value, interchangeably. Hence her well-known *Allegory on the Banks of the Nile; Derangement of Epitaphs; A Barbarous Vandyke,* etc.

MÄLAR, mä'lär, Lake of, Sweden, a lake running inland from the Baltic about 81 miles, with an average breadth of 13 miles and an area of 450 square miles. It contains upward of 1,200 islands. Its east end is closed by Stockholm, where its waters are poured into the Baltic by various channels, the difference of level being about six feet. It is surrounded by the populous districts of Stockholm, Nykioping, Upsal and Westeras, and the shores are varied with bays and hills, woods, lawns and cliffs, and are adorned with many castles, countryseats and villas, including the royal palaces of Drottningholm and Gripesholm.

MALARIA, an infectious disease caused by one of several parasites of the genus *Plasmodium.* It exists in birds and poultry (avian malaria), as well as in man. Human malaria is caused by four varieties of plasmodia: the *P. falciparum,* the *P. vivax,* the *P. malariae,* and the *P. ovale.* It is transmitted by mosquitoes of the genus *Anopheles.* The plasmodia are found in the blood where they occupy the red cells which are destroyed ultimately, at which time the full-grown parasite escapes, after dividing into segments, into the circulation where each segment again invades a red cell. The process of growth and fission continues indefinitely at regular intervals unless proper antimalarial treatment is instituted. The disease itself is characterized by intermittent chills accompanied by blueness of the skin, followed by high fever with remission, the temperature falling to normal or subnormal until the onset of the next paroxysm. In some varieties of malaria the course of the disease is rapid and irregular, a fatal termination sometimes occurring. This last is known as pernicious malaria.

The disease is of great antiquity and may have been mentioned by Hippocrates; and it has long

been regarded by some authorities as having been the cause of the decadence of the early Greeks. Thomas Sydenham (1624–1689) of London gave one of the earliest descriptions of malarial fever in 1685. Cinchona bark, used for centuries in its successful treatment, is said to have been introduced into Spain from Peru about 1632. Pedro Baldi (17th century), physician to Philip IV of Spain, was the first to publish information on the nature of Peruvian bark (1642). Quinine, the active principle of the bark, was first isolated in 1820 by Pierre Joseph Pelletier (1782–1842) and Joseph Bienaimé Caventou (1795–1877). The malarial parasite was first seen in 1880 by Alphonse Laveran (1845–1922), who seems to have realized its significance, although he made no further discoveries of importance regarding it. Seventeen years later, Ronald Ross (1857–1932) made the epochal discovery that the mosquito is the host, when he beheld the plasmodium in the stomach of the anopheles mosquito. This dramatic discovery was one of the greatest in the history of preventive medicine and has saved the lives of millions.

Malaria is most prevalent in tropical and subtropical regions, especially along coastal plains, river valleys, and marshy areas. In Asia, particularly in India, it is endemic. In certain regions, such as Mian Mir, it was once rampant, constituting a health problem of the first magnitude. It is widely distributed throughout Africa, and exacts a heavy toll in Liberia, Belgian Congo, and Senegal. Once it was common in Italy. It is also presently found in many parts of South America, such as Brazil, in south China, Malaya, and the islands of the Pacific. Of late it has declined rapidly in highly enlightened countries, in many of which it is practically extinct.

The diagnosis of the disease often presents difficulties, since the cycle of the parasite varies. The *Plasmodium vivax* is found in benign tertian malaria, the attack occurring every third day; the *P. malariae* is found in the quartan variety, the paroxysm coming every fourth day; the *P. falciparum* is present in the malignant tertian (estivo-autumnal), or pernicious variety, in which the paroxysms and fever curve are irregular. The classic symptoms are not always present. Occasionally, cyclic vomiting occurs, which hides the evidence of chills and shaking. From a clinical viewpoint, the disease may be divided into two main groups of cases. In the first, chills, fever, and sweating occur at regular intervals if the malaria is untreated. In the second, the symptoms are irregularly continuous.

The incubation stage is from ten days to three weeks and there may be prodromal or warning signs, such as failure of appetite and headache prior to the onset of the paroxysm. This is ushered in suddenly, with a violent chill, rapid pulse, and extreme prostration. Within two or three hours the temperature may rise to as high as 104° with the usual signs attending high fever, such as intense headache and backache. This is followed in four to six hours by a stage of intense sweating, after which the temperature falls to normal. The following day the temperature remains normal and the patient is quite comfortable except for weakness, but within 48 hours of the first paroxysm, the symptoms are repeated, possibly with even greater severity. In the pernicious form (estivo-autumnal), the seizures do not follow a definite pattern. The fever is irregular and continuous, and in certain forms delirium may be present, the patient becoming unconscious. In these forms, the temperature may be extremely high (106°) and death may result. In some cases, vomiting, diarrhea, and bloody urine are noted (blackwater fever). In others, there is intense jaundice and evidence of toxemia. In all malarias, anemia is present from red blood cell destruction and this may be severe in cases of long standing.

The plasmodium, which may be seen under a microscope, has been mentioned. Its life cycle is similar in all varieties, but the time varies from 48 to 72 hours. Parasites are found in the red blood cells as small ring-shaped bodies devoid of pigment. In human beings they enlarge greatly in the blood cell and develop pigment, finally, as has been mentioned, dividing into segments which are liberated into the blood stream after the cell in which they develop is destroyed. Following this, the new cells, now many times multiplied, invade other red corpuscles and the cycle is repeated. A female cell (macrogametocyte), a variety of sexually differentiated plasmodium which develops in the red blood cell but does not undergo segmentation, if ingested from circulating plasma by a mosquito of the genus *Anopheles,* will develop within the insect and may be transmitted from its salivary ducts to a person on whom it feeds. Thus the disease is spread far and wide if no protection is afforded.

Malaria is easily diagnosed through an examination of stained blood films. The optimum time for making such a diagnosis is about eight hours after a chill has occurred. If quinine has been administered, it may be impossible to make a microscopic diagnosis. All malarial fevers respond to the administration of quinine. If no result is obtained after such specific treatment for a period of one week, the disease under suspicion is not malaria. The prognosis is usually good. Even without specific treatment, most cases of benign malaria will recover within a few weeks, the disease being to a certain extent self-limited. With proper treatment, cure is assured although relapses are common, and for this reason a considerable period of observation by a physician is advisable, even after an apparent full recovery. Pernicious malaria has a more guarded prognosis. Treatment is not so salutary and relapses occur in a high percentage of cases.

The treatment of malaria is both preventive and curative. The most important measures in prevention are those which protect the person from being bitten by the causative agent, the anopheles mosquito. Complete screening of houses, the use of bed nets at night, drainage of marshy land, and covering of stagnant water with a film of kerosene to destroy the larvae are all important. In addition, treatment of all persons having enlarged spleens, who live in malarious localities, will cut down the number of human carriers. Quinine itself is not particularly useful as a preventive, although it is employed and seems to delay the onset of the disease in persons bitten by infected mosquitoes. When the disease appears, it is usual to employ quinine in .650 gram doses three times a day, in capsules or tablet form by mouth. Within three to five days the chills disappear and the treatment is then continued for about two months, using a single full dose of quinine once daily. During World War II, when there was a great shortage of quinine, atabrine and plasmochin, synthetic

drugs, were used with great success with troops in the field. There is no sure immunity against malaria, although some persons seem to have developed an immunity after an attack of the disease and continue to live in malarious localities without again acquiring it. The nature of this immunity is unknown. Attempts have been made to cultivate the parasite outside the body (in vitro), but without success. Until this is achieved, the question of whether or not there is such a thing as artificial immunity against the malarial parasite must remain unanswered.

MALARIAL FEVER. See MALARIA.

MALASPINA, mä-lä-spē'nä. (1) A glacier, Alaska, extending from Mount Saint Elias, at an elevation of 18,000 feet, to Yakutat Bay, a distance of 90 miles, while its front on the Pacific is between 60 and 70 miles wide. It was named in honor of the Spanish explorer, Alejandro Malaspina, who traversed the region in 1789–1794 in search of the Northwest Passage. With its tributaries, the Seward, Agassiz, Tyndall, and Guyot, the Malaspina covers some 1,500 square miles and has a depth of more than 1,000 feet. As it reaches the Pacific it breaks into dangerous icebergs which threaten shipping. (2) A volcano, also known as Mount Canlaon, 8,087 feet high, on Negros Island in the Philippines.

MALATESTA, mä-lä-tĕs'tä, a noble Italian family, leaders of the Guelphs in Romagna and rulers in Rimini in 1216–1528. Giovanni and Malatesta of the Malatesta tribe entered Rimini in 1216 and were granted citizenship in consideration of their aid against Cesena. The family rapidly gained in power and in 1237 Giovanni was named podestà. He was succeeded upon his death in 1247 by his son, Malatesta da Verucchio (1212–1312), who became supreme ruler in 1295 and who steadily increased his power until his death in 1312 at the age of 100 years. He also increased the power of the Guelphs and enjoyed the favor of Pope Boniface VIII. Of his four sons, two were Giovanni and Paolo, husband and lover, respectively, of Francesca da Rimini, whose story is told in Dante's *Inferno*. Malatestino, the eldest son of Malatesta, succeeded him upon his death in 1312, maintained the power of the Guelphs, annexed Cesena and, dying without issue in 1317, was succeeded by his youngest and only surviving brother, Pandolfo. The power of the Malatestas was extended over neighboring territories in succeeding years and the family became one of the most influential of the Renaissance. Carlo (1364–1429) was an ardent supporter of the popes, represented Gregory XII at the Council of Constance, and was named vicar of the church in Romagna. His nephew, Sigismondo Pandolfo (1417–1468), was a valiant soldier, a patron of arts and letters, as well as a poet and renowned antiquarian. He built the Church of Saint Francis, or temple of Malatesta, one of the most beautiful structures of the Renaissance. He made war for and against Pope Eugenius IV; against Venice and Florence with the Aragonese; then against the Aragonese at Piombino. He afterward fought with and against the Sienese, supported the cause of the Angevins, and was excommunicated in 1460 and burned in effigy by Pope Pius II. He was afterward restored to favor, but before his death he was practically stripped of his powers and possessions. He was succeeded by his wife, Isotta, and his son, Salustio, but both were murdered by an illegitimate son, Roberto. Roberto's son, Pandolfo IV (1475–1534), was the last Malatesta to rule Rimini, and he sold his rights to the Venetians in 1503. Thereafter the Malatestas at various times endeavored to regain control of Rimini until 1528, when it was incorporated in the Papal States. The Malatestas became citizens of Venice, and the Rimini branch became extinct in 1716.

MALATYA, mä-lä-tyä' (ancient MELITENE), city, Turkey, capital of a vilayet of the same name, on the railroad west of the Euphrates, 112 miles northeast of Gaziantep. Known to the ancients as Melitene, it was the station of the 12th (Thundering) Legion under Titus, and was raised to city status under Trajan. It was the capital of Armenia Tertia under Justinian. There are many ruined mosques and baths, relics of the city built in 756 by the caliph al-Mansur. Between the 6th and the 12th centuries, Malatya changed hands between the Greeks and the Saracens several times. It was reputed to possess 60,000 fighting men at the opening of the 11th century, and in 1102 was returned to Saracen control. Bar-Hebraeus, the celebrated Syrian scholar, was born there in 1226. After a disastrous earthquake in 1893 the city was practically rebuilt; much damage was done to it during the massacre of Christians in 1895. Malatya is an important trading center for agriculture produce. Besides Turks and Kurds, the population includes many Christian Armenians. Pop. (1945) 41,559. The vilayet of Malatya has an area of 8,208 square miles and population (1945) of 438,397.

MALAY, mä-lā', member of a people inhabiting the Malay Archipelago and Malay Peninsula (qq.v.). The true Malays, akin in racial type and language to the Polynesians and Micronesians, call themselves Orang Malayu. They descend from a proto-Malay tribe in Sumatra who, after some infusion of Hindu blood and culture beginning about 400 A.D., crossed to the Malay Peninsula and founded Singapore about 1160. They spread also to Java, and carried their maritime trade and piracy to other coastlands, sometimes driving the Indonesian aborigines, as in Borneo, into the uplands. In the 14th century the Malays established the kingdom of Malacca, and afterward they took possession of the Sunda Islands, the Philippines, the Moluccas, and some of the island groups of Australasia.

Physically considered, the Malays are a well-knit, olive-brown people of low stature, slight in figure, and with very small wrists and ankles. The face is round, the eyes black and somewhat almond-shaped, the nose short and small, the cheek bones prominent, the features flat, and the hair straight and black. The aboriginal inhabi-

tants of the Malay Peninsula, who now number about 30,000 people, are usually divided into two main divisions, Semang and Sakai; the Jakun, formerly considered to be a separate division, are now regarded as a subdivision. It is probable that the Sakai, whose original home is conjectured to have been Yunnan, China, appeared in Malaya some thousands of years before Christ. The Semang Negritos, having racial affinities with the Aëta of the Philippines and the aborigines of the Andaman Islands, may have been earlier arrivals. They roam the jungles in northern Malaya and are mostly men of the plains; they are regarded as being very low in the scale of civilization, and have only a very scanty knowledge of agriculture. The Sakai, who inhabit the hills and foothills south of the Semang, are of Mongoloid stock; they are seminomadic, and often live in communal huts. The Jakun are to be found in the coastal forests of southern Malaya. Originally seafarers in the course of many centuries they have in some cases been forced inland up the rivers.

A considerable element in the physical make-up of the civilized Malay is derived from the aboriginal stock. The Sakai are frequently tree-dwellers, building their houses in forked trees, 8 to 12 feet above the ground, reached by bamboo ladders which are hoisted at will. The tree-dwellers formerly made use of long blowguns from which were shot poisoned arrows. The blowgun was a bamboo about one and one-half inches in diameter and six and one-half feet in length. The bore, drilled most accurately, was a quarter of an inch; and the darts were nine inches in length, sharpened at one end and poisoned. With these they secured all the meat they ate in the jungle—birds, monkeys, snakes, and lizards.

The conversion of the Malays to Islam, which spread from northern Sumatra to Malacca, began in the 13th century. This process of Islamization was gradual and was not completed until about the 17th century, when Iskandar Muda, sultan of Atjeh, compelled acceptance of Islam at the point of the sword. Its effect among the Malays was enormous: India lost its pre-eminence among them as a sort of mother country; Indian ties were loosened and finally broken; Indian culture was no longer sought after; and the Arabs and their religion and culture were taken as a pattern. Nevertheless the Malays are still animist at heart. Their spirit worship and sorcery include a belief in man tigers, and the related semihypnotic state called *latah,* in which the victim makes violent involuntary movements in imitation of the actions of another person. They are also subject to neurotic crises, especially in the form called *amok,* a murderous frenzy, from which is derived the expression "to run amuck." The Malays are addicted to cockfighting and games of chance. The Malay language, which is widely used in southeastern Asia as the language of commerce, is soft and harmonious, and of simple structure; it is written in Arabic script. The literature, which is copious, comprises poetical compositions, such as rhyming proverbs, love songs, and dramas; and prose writings which are mostly based on Arab or Persian models.

H., *Malay Proverbs in English and Malay* (Sydney, Australia, 1937); id., *Malay Made Easy,* 4th ed. (Sydney 1944); Cole, Fay-Cooper, *The Peoples of Malaysia* (New York 1945); Winstedt, Sir R. O., *The Malays: A Cultural History* (Singapore 1947).

MALAY ARCHIPELAGO, the great island group off the southeast coast of Asia, lying across the equator between the Pacific and the Indian oceans. It comprises the islands of Indonesia, together with New Guinea, Borneo, and the Philippines. The majority of the inhabitants are of Malay or Melanesian stock. Borneo and Sumatra, among the larger islands, stand on the Sunda continental shelf, which extends southeast from the Malay Peninsula and Indochina at a depth of less than 250 feet. The Celebes and smaller islands to the south and east are the tops of submarine ridges which rise between deep basins—such as the Flores, Celebes, and Banda seas.

MALAY PENINSULA, or **MALAYA,** the most southerly part of the mainland of Asia, is a long, relatively narrow portion of land extending in a southeasterly direction from the Isthmus of Kra (partly Siamese, partly Burmese) to the island of Singapore at its southern extremity. The length is some 750 miles and the maximum breadth, 210 miles. The peninsula south of Burma and Thailand constitutes the Federation of Malaya (q.v.), which has an area of approximately 50,850 square miles. The Strait of Malacca separates the west coast of the Malay Peninsula from Sumatra; on the east of the peninsula is the South China Sea. A range of mountains forms the backbone of the peninsula, numerous peaks exceeding 6,000 feet in altitude. The highest elevations are Gunong (Mount) Tahan, 7,185 feet, on the boundary between Pahang and Kelantan, and Gunong Kerbau, 7,159 feet, between Pahang and Perak.

Four fifths of the surface of the peninsula is covered by dense tropical jungle which yields ebony, teak, sandalwood, camphor, and other valuable timbers and more than 40 varieties of palm. The only generally cleared parts of the country are long stretches down the west coast, an area in the north, and a number of open stretches up the principal rivers. The rivers, at their sources and in their upper reaches, are quick-flowing, often with tortuous rapids and precipitous gorges. In the lower reaches, the descent is more gradual and the water takes on a muddy hue from contamination with the silt of the plains through which the rivers meander, debouching ultimately through strips of mangrove swamp—particularly on the west coast. The two principal rivers of the peninsula are the Pahang, 285 miles in length, which flows into the South China Sea, and the Perak, 200 miles long, which enters the Strait of Malacca. The coastline of the Malay Peninsula extends for over 1,000 miles. On the west is a practically unbroken succession of mangrove forests and mudflats, with infrequent indentations of picturesque bays fringed with coconut palms and the graceful spires of the casuarina; on the east coast there are long unbroken stretches of sand and surf bordered by a littoral vegetation which lends to it a beauty possibly unparalleled in the tropics.

Within the territorial waters lies Langkawi Island, on the west side of the peninsula, off Kedah, the highest peak of which is 2,888 feet in altitude. Farther south is the island of Penang (q.v.), whose features have been eulogized by travelers from the earliest times. The island of Pangkor, off the coast of Perak, was once a Dutch settlement, but little remains in evidence of this history beneath the vegetation which has

long since reclaimed its own. Off the east coast, among a sprinkle of beautiful islands, there is Tioman (a possession of Pahang), with its symbolic silhouette of granite peaks.

The principal features of the climate of the Malay Peninsula are copious rainfall, high humidity, and a uniformity of temperature which rarely varies more than 15 degrees during the day. There are no well-defined divisions between the seasons. The average monthly rainfall is some 8.0 inches; the average maximum temperature on the plains is 91°F., and the average minimum is 71°F. However relaxing may be the humid monotony of the perpetual summer's afternoon which is the Malayan climate, it has the redeeming feature of a cool and not infrequently chilly night.

Tigers and leopards are numerous and of great size. The Asiatic elephant, the rhinoceros, the seladang (a type of bison), the honey bear, and numerous varieties of deer are found, as well as apes and monkeys, many poisonous snakes, and numbers of beautiful and brilliant birds. Tin is by far the most important of the peninsula's mineral resources. See also FEDERATION OF MALAYA.

Consult Ridley, H. N., *Flora of the Malay Peninsula*, 5 vols. (London 1922–1925); Swettenham, Sir Frank, *British Malaya* (London 1929); Scrivenor, J. B., *Geology of Malaya* (London 1931); Tweedie, M. F. W., *Poisonous Animals of Malaya* (Singapore 1946).

MALAY STATES, nine native states under British protection in the Malay Peninsula. Four of them (Pahang, Perak, Selangor, and Negri Sembilan) formerly constituted the Federated Malay States, the remaining five (Johore, Kedah, Kelantan, Perlis, and Trengganu) being unfederated. In 1946 the nine Malay states and two former constituents of the Straits Settlements (Penang and Malacca) were federated as the Malayan Union; and in 1948 the latter was reorganized as the Federation of Malaya (q.v.).

MALAYA, FEDERATION OF. See FEDERATION OF MALAYA.

MALAYALAM, măl-ā-yā'lăm, an independent Dravidian language of southern India, originally allied to Tamil and spoken on the Malabar Coast. Malayalam is said to have developed from Tamil since the 9th century and now differs from it in pronunciation and in idiom, and in the retention of old Tamil forms obsolete in the modern languages.

MALAYAN BEAR, or **SUN BEAR,** a small bear (*Ursus malayanus*) found in the Malay Archipelago. It is about four and a half feet in length. The fur is black, fading into brown on the nose, which is broad and blunt. The chest bears a crescentic white mark, or an orange-colored, heart-shaped patch.

MALAYAN SUBREGION, a faunal division of the Oriental Region, composed of the southern end of the Malay Peninsula and all the islands of the Malay Archipelago as far as the Philippines and to Makassar Strait, where this district is separated from the Australian and Papuan subregions by Wallace's line (q.v.). The orangutan and the birds of paradise are its most characteristic groups. See DISTRIBUTION OF LIVING MAMMALS; ZOOGEOGRAPHY.

MALBAIE, măl-bā'. river, Canada, wholly within Charlevoix County, Quebec. After a widely curving course it turns southeast to join the Saint Lawrence River. At the confluence is La Malbaie, the county seat. The river is about 80 miles in length.

MALBONE, môl'bōn, **Edward Greene,** American miniaturist: b. Newport, R. I., August 1777; d. Savannah, Ga., May 7, 1807. He had a studio in Providence, R. I., during 1794–1796 and thereafter in Boston, Mass., until 1800, when he moved to Charleston, S. C., with his friend Washington Allston (q.v.). In 1801 they sailed for Europe, meeting Benjamin West (q.v.) in London. Rejecting the latter's advice to remain there, at the end of the year Malbone returned to Charleston. During 1804–1805 he again worked in Boston. Among his portraits were two (*Egeria* and *Annette*) of members of the Middleton family. The Corcoran Gallery, Washington, D.C., acquired his self-portrait; and the Museum of Fine Arts, Boston, his portrait of Washington Allston.

MALBORK, măl'bôrk, city, Poland, in Gdańsk Department, on the Nogat River 25 miles southeast of Gdańsk (Danzig); until 1945 it was within East Prussia, then bearing the name of MARIENBURG. The notable castle, dating from 1274, was the seat of the Teutonic Knights (q.v.) from 1309 until 1457, when it was acquired by the Poles. The city passed to Prussia in 1772, and subsequently became an important railroad center. Manufactures include chemicals, rubber products, soap, and sugar. It lay within the area of Prussia assigned to Poland in 1945 by the Potsdam Conference. Pop. (1946) 38,968.

MALCOLM, măl'kŭm, name of four kings of Scotland. MALCOLM I MACDONALD (d. 954) succeeded to the throne in 943. He secured cession of Cumbria in 945 from Edmund I, king of the West Saxons. MALCOLM II MACKENNETH (d. 1034) came to the throne in 1005. During his reign Lothian and Strathclyde were secured to Scotland. MALCOLM III MACDUNCAN, surnamed CANMORE (d. near Alnwick, Northumberland, Nov. 13, 1093), was the son of Duncan I, who was slain in 1040 by Macbeth (Maelbaethe), mormaor of Moray. With the help of his uncle, Siward, earl of Northumberland, he defeated Macbeth in 1054 and killed him in 1057. He was crowned at Scone. His marriage in about 1067 to Margaret, sister of Edgar the Aetheling, Saxon pretender to the throne of England, provoked retaliation by William the Conqueror in 1072. From 1077 to 1080 he waged war against England, and in 1093 he invaded Northumbria. He was slain while laying siege to Alnwick. His reign had an important bearing on the consolidation of Scotland. Margaret, who died a few days later, was afterward canonized; she was largely responsible for the ecclesiastical reform effected in Scotland by her husband. MALCOLM IV, surnamed the MAIDEN (b. 1141; d. Jedburgh, Dec. 9. 1165), succeeded his grandfather, David I, in 1153. He suppressed two rebellions in Scotland, but in 1157 he was forced by Henry II of England to relinquish Northumberland and Cumberland.

MALCOLM, Sir **John,** British colonial administrator and diplomat: b. Burnfoot, Dumfriesshire, May 2, 1769; d. London, May 30, 1833.

Entering the service of the East India Company as an army officer in 1782, he rose to reach the rank of major general in 1822. In 1799 he was sent to Persia to negotiate a treaty of alliance against Napoleon, and he was ambassador to that country in 1800, 1807, and 1810. During 1804–1805, following the Second Mahratta War, he helped to restore order in Sindhia and Holkar; and in 1817 he was appointed political agent in the Deccan. From 1827 until his retirement in 1830 he served as governor of Bombay. He wrote several books on India, and *The History of Persia* (2 vols., 1815).

MALCZEWSKI, mäl-chĕf'skē, **Antoni,** Polish poet: b. Warsaw, 1793; d. there, May 2, 1826. After serving in the Polish army during 1811–1816 he traveled through Europe, at that period becoming a close friend of George Gordon Byron (q.v.). His principal work was the narrative poem *Marja* (1825), the literary merits of which were recognized only after his death. During his life none of his compositions brought him fame, and he died in wretched poverty.

MALDEN, mâl'dĕn, Mass., city in Middlesex County, on the Malden River 5 miles north of Boston; altitude 32 feet; it is served by the Boston and Maine Railroad. The city is both a residential suburb of Boston and an important manufacturing center, products including rubber shoes, shoe lasts and trees, women's and children's clothing, and leather goods. The public library, completed in 1885 to the designs of Henry Hobson Richardson (q.v.), houses a notable collection of paintings by French and American artists. The Bell Rock Memorial Park, with a Civil War soldiers' and sailors' monument, marks the site of the town bell of colonial times by which the townsfolk were called to worship or to fight fire. The Parsonage House, 1724, was the home of the Rev. Joseph Emerson, ancestor of Ralph Waldo Emerson and the birthplace of the Baptist missionary to Burma, Adoniram Judson. Michael Wigglesworth colonial poet and preacher, was pastor here for some 50 years (qq.v.). The first settlement, about 1640, was made by persons moving out from Charlestown, which was expanding rapidly. They established homes along the Mystic River, of which the Malden is a branch, and called the place Mystic Side. In 1649 Malden became a separate municipality. Following its incorporation by the General Court, it had town government by a board of selectmen, until 1881, when it received a city charter. Since then the municipal government has been administered by a mayor with a bicameral body composed of a board of aldermen and a city council. Melrose was set off from Malden in 1850, and Everett in 1870. Pop. (1930) 58,063; (1940) 58,010; (1950) 59,084.

MALDEN, a South Pacific coral island 108 miles northwest of Starbuck Island and 275 miles southeast of Jarvis Island, within the jurisdiction of the high commissioner of the (British) Western Pacific Islands. The island, 35 square miles in extent, is uninhabited. There are remains of stone foundations for houses and temples which indicate that at one period the island was inhabited by Polynesians. No fresh water is now available, old wells having become salty or gone dry. During the 19th century extensive guano deposits on Malden were worked by an Australian company.

MALDIVE, mäl'dīv, **ISLANDS,** a chain of coral islands in the Indian Ocean 400 miles southwest of Ceylon; the archipelago constitutes a dependency of that British island colony. The Maldives comprise several hundred islets, of which 300 are inhabited, grouped in 17 atolls. The inhabitants, who according to the 1946 estimate numbered about 93,000, speak a dialect of Singhalese and are Mohammedan in religion. The capital of the dependency is on the island of Malé. A sultan (Lord of the Thousand Isles) is assisted by a People's Assembly, most members of which are elected. Dried fish, cowrie shells, coconut coir, and tortoise shell are the principal exports from the islands. The Maldivians are expert sailors and navigators, and carry on a considerable trade with India, Ceylon, and Sumatra. During the 16th century the Maldivians repelled numerous attempts by the Portuguese to establish a settlement on their islands. Subsequently they were attacked on many occasions by pirates from the Malabar coast of India, and as a consequence the Maldivians placed themselves under Singhalese protection in the 17th century. During World War II, a British naval port and airbase was constructed on the isolated atoll of Addu, southernmost of the Maldive Islands. Consult Hockly, T. W., *A Short Account of the People, History, and Customs of the Maldive Archipelago* (London 1935).

MALE FERN. See FERNS AND FERN-ALLIES.

MALEBRANCHE, mâl-brănsh', **Nicholas de,** French metaphysician: b. Paris, Aug. 6, 1638; d. there, Oct. 13, 1715. He was the youngest child of Nicolas de Malebranche, secretary to Louis XIII, and Catherine de Lauzon, sister of a viceroy of Canada. In 1660, after studying theology at the Sorbonne, he entered the Congregation of the Oratory. He ranks second only to René Descartes (q.v.), greatest of French thinkers, in the history of French metaphysical speculation. The essence of his philosophy, which was founded upon that of Descartes, is a sort of mystical idealism. As set forth in Malbranche's brilliant work *Recherche de la vérité* (4 vols., 1674 ff), we have cognizance of things and objective realities as subjective thoughts and feelings, through the idea which resides in our souls; but this idea is in God, so that we perceive everything in God (*vision en Dieu*) as the primal cause of all existences and things. Hence the famous doctrine of Occasionalism or Interference, in accordance with which the objective thing and the subjective impression are made on every occasion to coincide, by the direct interposition of God, in whom alone we think and feel. In the history of philosophy Malebranche may be styled the connecting link between Descartes and Baruch Spinoza (q.v.), the difference between his philosophy and that of the pantheist Spinoza consisting in the fact that to him the Universe was in God, and to Spinoza God was, in fact, in the Universe. Other works included *Traité de la nature et de la grâce* (1680); *Traité de la morale* (1683); *Entretiens sur la métaphysique et sur la religion* (1688); *Traité de l'amour de Dieu* (1697). Consult Ollé-Laprune, L., *La Philosophie de Malebranche* (2 vols., 1870); André, *La Vie du Révérend Père*

Malebranche' (1886); Farny, 'Etude sur la morale de Malebranche' (1886).

MALESHERBES, Chrétien Guillaume de Lamoignon de, krā-tē-ăñ gē-yōm dė lä-moin-ŏñ dė mäl-ės-ārb, French statesman: b. Paris, Dec. 6, 1721; d. there, April 22, 1794. He was educated at the Jesuits' College, entered the legal profession and in 1745 became counsellor of the parlement of France; in 1750 he was president of the Court of Aids. He was broad-minded and liberal in his policy, favoring the publication of the 'Encyclopédie' and owing to his protestation against different measures of Louis XV was removed from office. Under Louis XVI he was Minister of the Interior, but resigned in 1776 and until the Revolution spent his time upon his estates and in travel, with the exception of 1787–88, when he was again Minister. At the outbreak of the Revolution he came loyally to the assistance of Louis XVI and was leading counsel in his defense. He remained with the monarch until almost the last and 11 months later was guillotined for treason. He was the author of essays and pamphlets on financial questions, etc.

MALET, Claude François de, klōd fräñ-swä dė mä-lā, French conspirator: b. Dôle, Franche-Comté, France, June 28, 1754; d. Paris, Oct. 29, 1812. He entered the army in 1771 and became a brigadier-general in 1799. Suspected of conspiracy against Napoleon, he was dismissed from the army in 1807 and confined in La Force. While there he laid new plots and was thenceforward confined in a state prison from 1808 till 1812. During Napoleon's campaign in Russia Malet made his escape from prison on the night of October 22-23, and by circulating the false news of Napoleon's death won over some of the National Guards. While the latter secured the principal public offices in his name, Malet liberated his fellow conspirators, Generals Guidal and Lahorie, from prison. He was, however, himself taken prisoner by Laborde, chief of the military police of Paris, and was shot with his fellow conspirators.

MALET, Lucas. See HARRISON, MARY SAINT LEGER.

MALFATH, Giovanni Francesco Guiseppe, Italian mathematician: b. Ala di Trento, 1731; d. Ferrara, 1807. He was educated at the Jesuit College at Verona and later studied under Riccatti at Bologna. For 30 years from 1771 he was professor of higher mathematics at Ferrara and attained high rank among the mathematicians of his time. He is best remembered for his publication of a mathematical problem known as "Malfath's problem," of which he gave the first solution. It was published in a memoir 'Tentativo per la risoluzione delle equazioni di quinto grado' (Pavia 1772).

MALFORMATION IN PLANTS. See PLANTS, MALFORMATION IN.

MALHERBE, François de, fräñ-swä dė mäl-ārb, French poet: b. Caen, France, 1555; d. Paris, Oct. 16, 1628. He was educated in Heidelberg and was engaged in the wars of the League. In 1605 he became court poet under Henry IV, but his work as a critic was of greater value than his poetry, which was lacking in poetic feeling and originality, though metrically perfect. He was the founder of the French school of classicism and must be credited with arousing a critical sense among the thinkers of France. His works consist of translations from the Latin and one volume of original verse. Consult Allais, 'Malherbe et la Poésie française à la fin du XVI. Siècle' (1892); Brunot, 'La Doctrine de Malherbe' (1891).

MALIBRAN, Maria Félicité, mezzo-soprano singer: b. Paris, 1808; d. Manchester, England, 1836. She was early trained for the operatic stage by her father, Manuel Garcia (q.v.), the Spanish tenor, and made her début in London (1825). She had lived in that city since 1817 as a teacher of singing, and her success in Rossini's 'Barber of Seville' was such that she was induced to follow her father to New York, where he had an engagement to establish grand opera. Here she married a French merchant named Malibran. She returned to the stage on her husband's failure in business, and in the spring of 1828 appeared on the Parisian boards in Rossini's 'Semiramis.' She subsequently was welcomed with great enthusiasm in London, Naples, Vienna, Milan and Venice, and traveled with the violinist de Bériot, whom she married shortly before her early death. She was a great actress as well as a marvelous songstress, and the irresistible charm of her person, added to the generosity of her mind and disposition, made her during her brief career one of the most fascinating operatic singers that had ever won the applause of the European public. In 1838 a statue was erected to her in Brussels, which had been her last place of residence. Consult Nathan, 'Life of Madame Maria Malibran de Bériot' (1846); Teneo, M., 'La Malibran, d'après des documents inédits' (in 'Sammelbände der internationalen Musik-Gesellschaft,' Leipzig 1906).

MALIC ACID, an organic acid discovered in 1785 by Scheele, and now known to be widely diffused throughout the vegetable kingdom, occurring sometimes in the free state, and sometimes in the form of its potassium, magnesium or calcium salts. It occurs abundantly, for example, in the gooseberry, cherry, strawberry and barberry, and also in unripe apples, from which latter fact it derives its name (Latin *malum,* an apple). It may be conveniently prepared by boiling the juice of mountain ashberries with enough milk of lime to almost neutralize it, and pouring the precipitate into boiling dilute nitric acid. Acid malate of calcium crystallizes from the nitric acid upon cooling, and this is dissolved in water, and precipitated by acetate of lead, the lead malate that is thrown down being subsequently decomposed by sulphuretted hydrogen gas. Malic acid has the formula $C_4H_6O_5$ or C_2H_3 (OH) $(COOH)_2$, is dibasic, and can be obtained in the form of colorless prisms or needles, which are hygroscopic, and dissolve readily in water and in alcohol. Malic acid kills algæ, and when present in a solution in any considerable amount it prevents the precipitation of cupric and ferric salts by the alkalis. With bases it forms compounds known as "malates," which are mostly soluble. See SUCCINIC ACID.

MALICE, *in law,* a premeditated or formed design to do mischief or injury to another, called also "malice prepense" or "aforethought." Blackstone says that malice prepense is not so properly spite or malevolence to the deceased

in particular, as any evil design in general; the dictate of a wicked, depraved and malignant heart; and it may be either express or implied in law. Express malice is when one, with a sedate, deliberate mind and formed design, kills another. It many cases where no malice is expressed, the law will imply it; as where a man willfully poisons another; in such a deliberate act the law presumes malice, though no particular enmity can be proved. A spiteful, malignant, vindictive or revengeful disposition is apt to commit acts of malice both in the ordinary and the legal sense, and may be guilty in the former and not in the latter sense. An injurious act emanating from a weak mind, a lack of caution or a sudden, unaccountable impulse, may have all the force of ordinary malice, but in the absence of a designed, intentional injury, it will not come within the strict limits of criminal malice. The law infers an intent to kill from the deliberate use of a deadly weapon, and it has been held that a burglar intended murder when he broke into a dwelling because he would commit it if necessary to escape.

MALICIOUS PROSECUTION, prosecution of a person unsuccessfully, maliciously and without cause. To constitute this offense it must be proved: (1) That the prosecution averred to be malicious was instituted by the defendant named. (2) That it was decided against prosecutor. (3) That the suit was without probable cause. (4) That the motive was malice. (5) That the plaintiff was injured by such malicious prosecution.

Quod facit per alium facit per se is fully applicable to the defendant in a suit for malicious prosecution; hence a corporation may be liable although it acted through its agent. See TORT.

MALIGNANT PUSTULE. See ANTHRAX.

MALIGNANTS, in English history, a name applied in 1643 by members of Parliament to designate those whom they considered to be the evil advisers of Charles I. Afterward the name was extended to all who sided with the king against the Parliament.

MALIK, mȧ-lēk′, **Jacob** (Russ. JAKOV), **Alexandrovich,** Soviet government official: b. Kharkov, 1906. He was educated at the Institute of People's Education in Kharkov and at the Soviet Institute for Foreign Affairs at the University of Moscow, from which he was graduated at the age of 31 and immediately entered the Foreign Office as deputy press chief in Moscow.

In 1939 Jacob Malik received his first foreign diplomatic assignment as counselor at the Soviet embassy in Tokyo. On May 20, 1942, he was appointed ambassador, and he remained in Tokyo until 1945, when the Soviet government declared war against Japan. He returned to Tokyo in January 1946 as political adviser to Lieut. Gèn. Kuzma Derevyanko, chief Russian delegate to the Allied Council for Japan. On Aug. 24, 1946, he was appointed to the Moscow post of deputy foreign minister for Far Eastern affairs, and shortly afterward as deputy commissar for foreign affairs. In May 1948, Malik replaced Andrei Gromyko (q.v.) as the Soviet Union's permanent representative to the United Nations.

As chief Russian U.N. spokesman he figured prominently during 1948 in debates over the Palestine and Kashmir questions, and he vigorously opposed the dissolution of the U.N. Atomic Energy Commission, which had voted to suspend operations because of a stalemate over policies. In early 1949 he sought U.N. membership for the Democratic People's Republic of Korea, and in January 1950 he demanded the expulsion of the Chinese Nationalists. After his resolution of Jan. 13, 1950, for the ouster of the Nationalists, had been blocked, Malik boycotted subsequent council meetings until Aug. 1, 1950, when he returned to the Security Council to assume the rotating presidency.

MALINAO, mä-lē′nou, municipality, Philippine Islands, in the Province of Albay, Luzon, situated 17 miles north of Legaspi. It is on the main road, and is the shipping point for the large hemp production of the surrounding region. There is an extinct volcano nearby and also mineral springs. Pop. (1939) 15,089.

MALINES. See MECHLIN.

MALINGERING, mȧ-lĭng′gĕr-ĭng, **a term** denoting feigning disease on the part of a soldier, sailor, prisoner, etc., in order to obtain discharge from service, or escape from duty or labor. It implies some overt act, such as the previous application of a ligature, or the taking of some drug, which produced the appearance of the disease said to exist. A worse form of the same crime, "willfully maiming," is erroneously called malingering.

Consult Callie, John, *Malingering and Feigned Sickness* (New York 1913); and Smith, W. R., *Medical Jurisprudence* (London 1913).

MALL, Franklin Paine, American anatomist: b. Belle Plaine, Iowa, 1862; d. Nov. 17, 1917. He took his M.D. at Michigan in 1883, later studied at Heidelberg and Leipzig and in 1886–1888 was a fellow at Johns Hopkins, acting as instructor in pathology at that institution 1888–1889. He was adjunct professor of vertebrate anatomy at Clark University in 1889–1892, and was professor of anatomy at the University of Chicago in 1892–1893. He was professor of anatomy at Johns Hopkins University after 1893 and after 1915 also served as director of the department of embryology at Carnegie Institute Washington, D.C. He was a trustee of the Marine Biological Laboratory, Woods Hole, Mass., and wrote extensively for scientific publications, including the *American Journal of Anatomy,* the establishment of which in 1901 was largely his responsibility.

MALL, môl or měl, **The.** (1) A promenade in Central Park, New York, regarded as one of the most successful landscape effects in the United States. (2) An avenue in London on the north of St. James' Park.

MALLALIEU, măl-lā-lū′, **Willard Francis,** American Methodist bishop: b. Sutton, Mass., Dec. 11, 1828; d. Aug. 1, 1911. He was graduated from Wesleyan University in 1857 and became a Methodist Episcopal clergyman in 1858. He held many important charges and in 1872, 1876, 1880, and 1884 was a member of the general conferences. He was presiding elder of the district of Boston in 1882–1884 and in 1884 was

elected bishop. He retired in 1904. He published 'The Why, the When, and How of Revivals' (1901); 'The Fullness of the Blessing of the Gospel of Christ' (1903); 'Words of Cheer and Comfort' (1907).

MALLARD. See DUCK.

MALLARMÉ, Stéphane, stā-fän mäl-ärmā, French poet: b. Paris, March 18, 1842; d. Valvins, Fontainebleau, Sept. 9, 1898. Most of his life was passed as an instructor in English at the Lycée Fontanes of Paris. He is known as the founder of the curious poetic school of the "Décadents," in whose organ, *Le Décadent,* as well as in *Le Parnasse Contemporain,* he published much. Incomprehensibility appears to have been the object of his study, and he entirely attained it in his preface to an edition (1880) of Beckford's 'Vathek.' Others of his works are 'L'Après-midi d'un faune' (1876); 'Petite Mythologie' (1878); 'Les Dieux antiques' (1880); 'Poésies' (1887), a translation of Poe's poems (1888), perhaps his most satisfactory performance; and 'Vers et prose' (1893).

MALLEABILITY, *in metallurgy,* the property of extending under the blow of a hammer. For every metal there is a temperature of greatest malleability. The following is the order of malleability of the metals: Gold, silver, copper, platinum, iron, aluminum, tin, zinc, lead.

MALLEABLE GLASS. See GLASS, CHEMICAL PROPERTIES OF.

MALLECO, mäl-yā'kō, formerly a province of Chile, now divided between Bio-bio and Cautin. Its area was 3,303 square miles, and its capital city was Angol. The country is mountainous and well wooded in the eastern and western parts. About one-half of the population is composed of Indians of the Arauco tribe. Wheat is the staple agricultural product of the country. The other industries of importance are cattle raising, timber cutting and mining. The population was about 120,000.

MALLEE-BIRD, or **MALEO,** a name for the Australian mound-bird (q.v.), derived from a native language.

MALLERY, Garrick, American ethnologist: b. Wilkesbarre, Pa., April 23, 1831; d. Washington, D. C., Oct. 24, 1894. He was graduated from Yale College in 1850 and was admitted to the bar in 1853; he practised law in Philadelphia until 1861, when he enlisted and served through the war in the Federal army, attaining the rank of lieutenant-colonel. He was executive officer of the Signal Service Bureau until 1876, when he was engaged in a geological survey in Dakota, and in 1879 was retired from the army and appointed chief of the bureau of ethnology. Among his books are 'A Calendar of the Dakota Nation' (1877); 'Israelite and Indian, a Parallel in Planes of Culture' (1889); 'Greeting by Gesture' (1891); 'Picture Writing of the American Indians' (1893), etc.

MALLESON, George Bruce, English soldier and historical writer: b. London, May 8, 1825; d. there, Feb. 28, 1898. He was educated at Winchester College, and from 1842 till 1877 served in India, at first in the army, and subsequently in government posts. His chief work 'History of the Indian Mutiny' (1878–80) commenced where the second volume of Kaye's 'Sepoy War' left off, and in 1890 there appeared a joint edition of the two histories in six volumes, the third volume of Kaye's work being omitted and a new sixth one added. Other works by him are 'The Mutiny of the Bengal Army' (1857); 'History of the French in India' (1868); 'Sketch of the Native States of India' (1875); 'Final French Struggles in India and Indian Seas' (1878); 'History of Afghanistan' (1879); 'The Decisive Battles of India' (1883), and lives of 'Clive'; 'Eugene of Savoy'; 'Prince Metternich'; 'Wellesley'; 'Dupleix'; 'Akbar' and 'Warren Hastings.'

MALLET, John William, American chemist: b. Dublin, Ireland, Oct. 10, 1832; d. 1912. He was educated at Trinity College, Dublin, and at Göttingen, and emigrating to the United States in 1853 became assistant professor in chemistry at Amherst 1854–56 and later chemist to the United States geological survey of Alabama. In 1856–60 he was professor of chemistry at the University of Alabama. He entered the service of the Confederacy and was paroled in 1865 as lieutenant-colonel of artillery. The chair of sciences at the University of Louisiana was occupied by him in 1865–68 and after 1868 he was professor of chemistry in the University of Virginia, becoming professor emeritus in 1908. He contributed valuable scientific articles to the leading chemical periodicals and published 'Cotton' (1862); 'Chemistry Applied to the Arts' (1868); 'Syllabus of a Course of Lectures on General Chemistry' (1890; rev. ed., 1901).

MALLET, a wooden hammer used in carpentry and also in the game of croquet (q.v.). The gavel is a variety of mallet. Various small mallets are used by gold beaters, jewelers, dentists and other artisans.

MALIAN, mä-yän', Julien de, West Indian dramatist: b. Le Moule, Guadeloupe, 1805; d. Paris, France, 1851. He gained wide reputation as a writer of comedies and dramas, many of which have been presented on the metropolitan stage. The most popular are 'Two Roses' (1831), a historical drama of the civil wars in England; 'The Carpenter' (1831), a comedy; and 'The Wandering Jew' (1834).

MALLOCK, William Hurrell, English author: b. Devonshire, 1849; d. April 2, 1923 He was graduated from Balliol College, Oxford and won the Newdigate prize in 1872. He never entered a profession but devoted himself entirely to literary work. His philosophical and sociological writings include 'Is Life Worth Living?' (1879); 'Social Equality, a Study in a Missing Science' (1882); 'Atheism and the Value of Life' (1884); 'Property and Progress' (1884); 'Labour and the Popular Welfare' (1893); 'Studies of Contemporary Superstition' (1895); 'Classes and Masses' (1896); 'Aristocracy and Evolution' (1898); 'Doctrine and Doctrinal Disruption' (1900); 'Religion as a Credible Doctrine' (1902); 'The Reconstruction of Belief' (1905); 'The Nation as a Business Firm,' and 'Social Reform' (1914). He also wrote several works of fiction, most of which deal with the same social and religious problems as the above works, including 'The New Republic' (1877), in which he introduced many

well-known contemporaries under thin disguises; *A Romance of the Nineteenth Century* (1881; new ed., 1894); *The Old Order Changes* (1886); *A Human Document* (1892); *The Heart of Life* (1895), and *The Individualist* (1899), and published two volumes of verse, *The Veil of the Temple* (1904); a translation of Lucretius *On Life and Death* (1878), and *An Immortal Soul* (1908). His philosophical works deal with the fundamentals of religion, arguing for supernaturalism and aiming to show that science alone supplies no basis for religious belief; in his political and economic writings, he attacked the radical and socialistic theories and tendencies of the age.

MALLOPHAGA, mă-lŏf'ă-gȧ. See INSECTS.

MALLORCA, mä-yôr'kä, or **MAJORCA,** mȧ-jôr'kȧ, Spain, an island in the Mediterranean, the largest of the Balearic group; area, 1,352 square miles. It is about 120 miles distant from Spain. It is very irregular in shape, and deeply indented, particularly in the northeast. The scenery is picturesque, the climate mild and agreeable, and in many of the valley regions vegetation is luxuriant. There are quarries of marble of various grades; lead and iron have been obtained, and coal to a considerable amount is mined. The olive and vine are extensively cultivated and there are large orchards of figs and oranges. The principal exports are olive oil, light wines, brandy, wool and silk. There is a wireless station with a 500-mile range located at Soller, not only for ship and shore traffic, but also for international service. Pop. (1940) 327,120.

MALLORY, Stephen Russell, American lawyer: b. Trinidad, West Indies, 1813; d. Pensacola, Fla., Nov. 9, 1873. His parents removed with him to the United States in 1820 and he was educated in Mobile and in Nazareth, Pa. He studied law and was admitted to the bar in 1839; he was United States senator 1851–57 and in 1861 entered the service of the Confederate States as secretary of a navy not in existence. He was arrested at the close of the war and held for 10 months, after which he returned to Pensacola and was until his death engaged in law practice.

MALLOW, a genus of herbs (*Malva*), of the family Malvaceae. The species, of which there are less than a score, are widely scattered and are characterized by angled, lobed or dissected leaves and solitary or clustered axillary flowers. They include four species cultivated in America and one very well-known weed, *M. rotundifolia,* popularly known among children as cheese-plant because of the shape of the fruits, which also suggested another popular name, shirt-button plant. The plant is a perennial, very persistent of life and rather difficult to eradicate except by constant clean cultivation. Musk mallow (*M. moschata*) is cultivated for its large, showy pink or white flowers; *M. alcea* is also popular. *M. crispa* furnishes a useful fiber, as probably other species could be made to do. Its leaves are often used for garnishing but are not eaten. This species and *M. sylvestris* are frequently seen in old gardens and in their vicinity as escaped plants, but are not offered for sale by seedsmen. The name mallow is loosely applied to many plants of the mallow family, but not of the genus *Malva;* for instance, marsh mallow (*Althaea officinalis*), rose mallow (*Hibiscus moscheutos*) and Indian mallow (*Abutilon abutilon*); also, more loosely still, to unrelated plants, as Jew's mallow (*Corchorus olitorius* or *C. capsularis*). See also CORCHORUS; HOLLYHOCK; HIBISCUS.

MALMAISON, mäl-mā-zôn̈, a celebrated French château on the Seine, 10 miles west of Paris. Built in the mid-18th century, it became the residence of the Empress Josephine who purchased it in 1798. After her divorce she returned to Malmaison where she died in 1814. After the disaster of Waterloo (1815), Napoleon spent five days there. It is now a museum of both the First and Second Empires. Its famous rose garden is partly restored.

MALMÉDY, a town at the eastern border of Belgium, southeast of Verviers. It is located in the romantic valley of the Amblève River. Like Eupen, it was returned to Belgium by the Versailles Treaty in 1918, reannexed by Hitler in 1940 and liberated in 1944. Belgium's claim to Malmédy is based on the fact that, up to 1815, it belonged to the principality of Stavelot.

The market place has lovely old houses and the old abbey is used as a town hall. Local industries are papermills and tanneries. Pop. (est. 1949) 5,597. See also EUPEN.

MALMESBURY, William of. See WILLIAM OF MALMESBURY.

MALMESBURY, England, market town and municipal borough, Wiltshire, 94 miles west of London, on the Great Western Railway. It is built on a ridge of land almost surrounded by the river Avon and one of its small tributaries. Its site was chosen by a Scottish or Irish monk named Maildulphus for a hermitage in 635. He later gathered a colony of disciples about him, one of whom, Adhelm, became abbot of the abbey founded there, ruins of which still remain. Athelstan rebuilt the monastery and is buried there. The town grew around the abbey, but was not incorporated until 1645, the charter then granted remaining in force until 1885. The modern town has a considerable agricultural trade, manufactures silk and pillow lace, and has tanneries and breweries. Two miles distant is the manor house of Sir Lawrence Washington, and the church at Gardson where many members of the Washington family are buried. Pop. (1947) 2,556.

MALMO, mäl'mė, Sweden, a seaport and the third largest town of the country, on the Sound, almost opposite Copenhagen, 17 miles distant, with which it has steam-ferry communication, a channel being maintained in winter by an ice-breaker. Malmö is a busy industrial center with important manufactures, is the terminus of several railroads and is 384 miles by rail southwest of Stockholm. The town and its harbor have been considerably improved and modernized, and an extensive export and import trade is carried on. Malmö dates from the 12th century, but until 1500 it was little more than a poor fishing village. It again suffered a period of decline but revived after the improvements to the harbor effected in 1775. Pop. 118,000. It has an interesting city hall, Saint

Peter's Gothic Church and an ancient castle. The industries include iron works and foundries, manufacture of railroad cars, shoes, gloves, tobacco, and chocolate.

MALMSEY, mäm'zĭ, a sweet wine, made from a grape grown on rocky ground, in Spain, Italy, and Madeira, exposed to the full influence of the sun, and not gathered until partially withered.

MALOLOS, mä-lō'lôs, municipality, Philippine Islands, and the capital of the Province of Bulacán, Luzon, situated at the head of one of the inlets of the Pampanga River delta, five miles northwest of Bulacán, the former capital and 20 miles northwest of Manila. It is a telegraph and military station, is near a station of the Manila-Dagupan Railroad and is the center of an important trade. It is in a region which was a stronghold of the insurgents, and immediately after the close of the Spanish War was made the capital of the insurgent government. Rice is extensively cultivated in the vicinity. Pop. (1948) 38,779.

MALON, mà-lôn', **Benoît,** French Socialist: b. near Sainte-Etienne in the Department of Loire, June 23, 1841; d. Asnières, Sept. 13, 1893. He early entered upon a journalistic career and his activities in behalf of Socialistic agitations caused his enforced absence from France for a time preceding 1880. He then founded the *Revue Socialiste* which he edited until his death. He attained considerable influence through the breadth of his teachings, which advocated the necessity for an inclusion of certain high religious, ethical and moral considerations with the socialistic principles of government. Author of *L'Internationale, son histoire et ses principes* (1872); *Histoire du Socialisme et des prolétaires* (1881–1884); *Le socialisme intégral* (1890–1891).

MALONE, mà-lōn', **Edmund,** Irish Shakespearean scholar: b. Dublin, Oct. 4, 1741; d. London, April 25, 1812. He was educated at Trinity College, Dublin, and was called to the Irish bar in 1767, but henceforth devoted himself entirely to literary pursuits. His most important and permanent critical works are *Attempt to Ascertain the Order in Which the Plays of Shakespeare Were Written* (1778), which still carries authority; his edition of the poet in 10 volumes; and the edition known as the Third Variorum, which was prepared after his death by James Boswell, the younger, out of material left by the critic, and published in 21 volumes. This last is still the best of all complete critical editions.

He also published *Remarks on the Rowley* (Chatterton) *Controversy; An Inquiry into the Ireland Shakespearian Forgeries;* and biographical memoirs of Sir Joshua Reynolds, Dryden, W. Gerard Hamilton, and others.

Consult Prior, James, *Life of Edmund Malone* (London 1864).

MALONE, Walter, American poet and jurist: b. Desoto County, Miss., Feb. 10, 1866; d. Memphis, May 18, 1915. He was graduated at the University of Mississippi and subsequently engaged in the practice of law and in literary work. He contributed to the periodicals of the day and published *Claribel and other Poems* (1882); *The Outcast* (1886); *Narcissus* (1893); *Dusk and Dawn* (1895); *December and June* (1896); *Coming of the King* (1897); *Songs of North and South* (1900); *Poems* (1904); *Songs of East and West* (1906); *Hernando DeSoto,* an epic poem highly praised (1914).

On March 29, 1905, on petition of practically all members of the Memphis bar, he was appointed judge of the Circuit Court of Shelby County and held the position until his death. An association composed of members of many states has been formed to erect a bronze portrait statue to Walter Malone in the principal park of Memphis; while another association has for its object to have his *Opportunity* cast into a bronze tablet to be erected in Court Square, in the heart of Memphis.

MALONE, mà-lōn', village, New York, and Franklin County seat; altitude 730 feet; on the Salmon River; and on the New York Central, and the Rutland railroads; 167 miles northeast of Utica. It has an airport. Situated 12 miles from the boundary between the United States and Canada, Malone is a port of entry for the seventh customs district.

Lying in the northern foothills of the Adirondack Mountains, the town is surrounded by a fertile agricultural area raising hops, hay, potatoes, and has dairy products. Considerable lumbering is also carried on. A large tract of woodland near by was burned over in the early 1900's, and, as a part of the Adirondack State Park, has been reforested. Mineral resources of the region remain to be developed. Industrially, Malone has had a varied list of products. Paper milling was at one time the chief dependence of the village; now other manufactures include shoes, slippers and moccasins, bronze and aluminum powder, and woolen clothing. There are lumber mills, tanneries, foundry and machine shops, and railroad repair shops. Hydroelectric plants line the river. The mills and lumber camps employ many French-Canadians. In most of the homes in the village, both English and French are spoken. This French-Canadian element is an important factor in the industrial population of northern New York, as in northern New England.

Malone has good schools, parks, playgrounds, and facilities for recreation. The northern New York Institution for Deaf Mutes is located here. The Wead Library is handsomely housed, and the county historical society maintains a library and a museum. There are many points of historical interest. The home of William Almon Wheeler (q.v.) is now the Elks Club. The home of the founder of the village, Richard Harison, was used during the War of 1812 as headquarters for Gen. James Wilkinson (q.v.); this was in 1813, when Wilkinson was ordered to the frontier and failed to carry out plans for a campaign in Canada. Arsenal Green was a parade ground in the War of 1812 and was occupied by British troops during the brief period when the village was held by them. The federal building, the courthouse, and old Franklin Academy are notable.

Malone was first settled in 1802 by a group of Vermonters, one of whom selected the name in honor of Edmund Malone (q.v.), an Irish Shakespearean scholar. The village was incorporated in 1833. From its earliest days Malone had a strong Irish element, and in 1866 the village was selected by the Fenians (q.v.) as a base for an invasion of Canada. They did ac-

tually cross the border, but, after an encounter with Canadian troops, they returned to Malone and disbanded. The village is governed by a mayor and council. Pop. (1940) 8,743; (1950) 9,501.

MALOO CLIMBER. See BAUHINIA.

MALORY, măl'ô-rĭ, Sir **Thomas,** author of the English prose romance *Morte d'Arthur.* The work was finished in the ninth year of Edward IV's reign, 1470, and published by Caxton in black-letter folio, in 1485. Little is known of the author; he may have been a priest; Caxton calls him "a servant of Jesus both day and night," and priests frequently were accorded the title "Sir." Probably he was a Welshman. See also ARTHURIAN ROMANCES; GRAIL, THE HOLY; LANCELOT OF THE LAKE; MERLIN; MORTE D'ARTHUR; TRISTAN.

MALOT, mà-lō', **Hector Henri,** French novelist: b. La Bouille, near Rouen, France, May 20, 1830; d. Vincennes, July 18, 1907. He studied law, but abandoned it for a literary career, and in 1859 issued the first of a long series of successful novels. He was for a time newspaper correspondent in London, and literary critic of *L'Opinion Nationale.* He wrote *Victimes d'amour* (1859); *Sans famille,* published in English as *No Relations* (1878); *Conscience* (1888); *Complices* (1893); *En famille* (1893); *Amours de jeune; Amours de vieux* (1896); an autobiography, *Le Roman de mes Romans* (1896).

MALPIGHI, măl-pē'gē, **Marcello,** Italian anatomist: b. Crevalcuore, Italy, March 10, 1628; d. Rome, Nov. 29, 1694. He received a medical education in Bologna and was granted a doctor's degree in 1653. In 1656 he became professor of medicine at Pisa, where he formed a friendship with the mathematician Borelli, who encouraged him to proceed with researches in anatomy. His health failing he returned to Bologna and continued his investigations, which resulted in discoveries which established facts undisputed in the modern world of science and placed the world's knowledge of physiology on a new footing; his researches in botany and entomology were highly important. In 1691 he was summoned to Rome as first physician to Innocent XII, in which office he died.

He published numerous scientific works of great value, a complete edition of which was published in Venice 1743. The principal of these are *Observationes Anatomicae* (1661) and *Epistolae Anatomicae* (1665).

MALPLAQUET, măl-plà-kā', **Battle of,** the bloodiest in the war of the Spanish Succession, gained by Marlborough and Eugène, the commanders of the allies, against the French under Claude de Villars, Sept. 11, 1709. The French lost 10,000; the allies more than 20,000. Malplaquet is a village in the Department of the Nord, near the Belgian frontier, 20 miles east of Valenciennes. After the victory there the allied armies soon took Mons and Douai. See SUCCESSION WARS.

MALSTATT-BURBACH, măl'shtät-bŏŏr'bäkh, section of Saarbrucken, Germany, on the Saar River. It is situated in a coal-mining district and is almost entirely given over to factories and workmen's dwellings. There are manufactories of iron, steel and cement machinery, boilers and safes. It has a large wharf for handling the exports of coal. Malstatt received municipal rights in 1321, but these were later surrendered. The town began to grow in the middle of the 19th century and in 1874 it joined with Burbach to form a city.

MALSTROM, Norway. See MAELSTROM.

MALT AND MALTING. See BREWING AND MALTING.

MALTA, môl'tà (ancient MELITA), British island in the Mediterranean. With Gozo and Comino it forms the British Crown Colony of Malta (Maltese Islands). The Maltese group has a total area of 122 square miles, of which 95 square miles belong to Malta. Malta is of irregular oval shape, 17 miles long, with a central breadth of nine miles; its greatest elevation is over 750 feet. It is of limestone formation, and is deeply indented on all sides except the south, where the coast forms a continuous and almost unbroken line. Of great strategical importance, it is very strongly fortified, especially Valletta, the capital, which is the headquarters of the British Mediterranean Fleet and the principal naval and mercantile coaling station in the Mediterranean. During World War I it was one of the most important of British naval stations and in World War II it was repeatedly bombed by German and Italian aircraft. It served as a British air base for attacks on Italian Libya and Sicilian airfields.

The climate is sultry in summer and somewhat enervating when under the influence of the humid sirocco blowing from Africa, but generally is mild and healthful. There are only a few small streams, but the springs are so numerous and copious that no deficiency of water is felt, and since 1880 an extensive system of waterworks has greatly improved sanitary conditions. Malta has a bare, stony appearance owing to the absence of trees. The soil is thin but remarkably fertile; and its fertility is increased by the skillful cultivation and the diligent toil of the inhabitants. Large crops of wheat and potatoes are raised, early varieties of the latter being largely exported to England; maize, barley, cotton, cloves, oranges, figs, grapes, carob beans and peaches and other fruits are also grown. Filigree ornaments and a little cotton are manufactured. Sheep and goats are kept, with smaller numbers of cattle, mules, asses and horses.

The language of the people is a dialect of Semitic origin derived from the Carthaginian and Arabic tongues, with a strong admixture of Italian. The native population believe themselves to be of Phoenician descent. English and Maltese are the official languages. English is used for all administrative purposes; Maltese is used in the courts of law, having been substituted for Italian in 1934.

The executive head of Malta is a governor, who is also commander in chief of the island. On Feb. 26, 1939, Malta was granted a new constitution under letters patent dated February 14 which granted some measure of self-government. These powers were enlarged in 1947. The constitution provides for a Council of Government, composed of eight official members, two unofficial members nominated by the governor, and 10 elected mem-

bers. The governor presides over the Council, with a casting vote but no original vote. Ecclesiastics are precluded from membership. Malta is of great historical, archæological and architectural interest. It was in St. Paul's Bay that the Apostle Paul is now generally believed to have been shipwrecked in 58 A.D. (Acts xxvii and xxviii). The island was held in turn by the Phœnicians, the Greeks, the Carthaginians, and the Romans. It was conquered by the Arabs in 870 A.D., and was attached to Sicily from 1090 until 1530, when the Emperor Charles V turned it over to the Knights of St. John, who distinguished themselves during succeeding centuries by their bold defense of Christianity against Moslemism, especially during the siege of 1565. As the Knights of St. John of Malta they became famous throughout the civilized world. They ruled the island until they were dispersed by Napoleon in 1798. Thereafter the Maltese rebelled against the French, and aided Great Britain when her fleet blockaded the island, 1798–1800. At the request of the inhabitants Britain made the island a protectorate, and it was formally annexed to the British Crown by the Treaty of Paris in 1814. It is one of the most important ports of call in the world. Consult Gatt Rutter, J., "Malta" (1936); Porter, W., "A History of the Knights of Malta" (1883); Zammit, Th., "Malta. The Islands and Their History" (1926).

MALTA FEVER or **UNDULANT FEVER,** a disease closely related to, if not identical with, the livestock malady known as Bang's disease or infectious abortion, and first described by Hippocrates nearly 2,300 years ago. Highly prevalent in the Mediterranean area, especially on the Island of Malta, it has spread from there throughout the world. Variously known as Malta fever, Mediterranean fever, Neapolitan fever, etc., more recently it was given the name "Undulant Fever" because the attacks come in waves or undulations. The symptoms are characteristic, the fever being accompanied by intense pain, enlargement of the spleen, swelling of the joints, excessive perspiration, etc. The fever may last for but a few days, a few weeks, or it may continue for months, then disappear only to reappear after an indefinite period. The patient may be ill for two or three years before any definite improvement is noted. The mortality rate, however, is low. The causative agent was isolated by Dr. David Bruce, a British army surgeon, in 1887, from human beings who had succumbed to the disease on the Island of Malta. He called the germ *Micrococus melitensis.* Later it was discovered that the germ invaded goats, and that humans commonly acquired it by drinking the milk of infected goats. It was brought to the United States a number of years ago when Southwestern ranchers imported large numbers of goats from Malta. It has since been learned that the germ invades cattle and swine, and most of the cases developing in the United States have been traced to the drinking of milk of infected cows. Professor Bang isolated the germ of the abortion disease in 1897, and in 1918 Miss Alice C. Evans of the U. S. Department of Agriculture discovered the similarity or close relationship between the germs isolated by Bruce and by Bang. See also BANG'S DISEASE.

MALTA, Knights of. See JOHN, ORDER OF SAINT.

MALTE-BRUN, mäl'tĕ-broon (Fr. mältbrŭn), **Conrad** (properly MALTHE BRUNN), Danish geographer: b. Thisted, Jutland, Aug. 12, 1775; d. Paris, Dec. 14, 1826. He devoted himself to literature and politics in Copenhagen, but having given offense by writing in favor of the liberty of the press and the enfranchisement of the peasants, was banished to Sweden in 1800. He went later to Paris, where he became famous as a geographer. He edited the foreign political department of the *Journal des Debats,* but is best known for his "Summary of Universal Geography" (8 vols., 1810–29). The first six volumes only were completed by Malte-Brun. Among his other works are "Ancient and Modern Poland"; "History of Travel," and "Mathematical, Physical and Political Geography."

MALTESE (mâl-tēs' or -tēz') **CROSS.** See CROSS.

MALTESE DOG. See DOG.

MALTHA, (1) according to Pliny, a name used for an inflammable mud which flowed from a pool at Samosata, Commagene, North Syria, and resembled naphtha. (2) A mixture of wax and pitch for caulking ships; mineral tar is another name for maltha, which is found oozing from rocks in certain localities, particularly in California.

MALTHUS, Thomas Robert, English political economist: b. near Guildford, Surrey, Feb. 14, 1766; d. Bath, Dec. 29, 1834. He studied theology at Cambridge and was ordained in the Church of England, continuing to pursue his profession as a teacher while holding a small living in Surrey. In 1805 he was appointed professor of history and political economy at Hailcybury College. In his famous "Essay on the Principles of Population" he propounded (1798) what is known as the Malthusian Doctrine, namely, that the increase of population advances at a geometrical, the increase of the means of life at an arithmetical, ratio; that this condition of things renders the condition of the poor more and more hopeless; that unless famine or war interfere to diminish population the means of life will eventually prove inadequate; that discouragement of early and improvident marriages and the cultivation of self-restraint must be employed to avert the danger. These positions have been the subject of long and widespread discussion. His other writings include "An Inquiry into the Nature and Progress of Rent" (1815); "Principles of Political Economy" (1826); "Definitions in Political Economy" (1827). Consult Bonar, "Malthus and His Work" (1885); Soetbeer, "Die Stellung der Sozialisten zur malthusischen Bevölkerungslehre" (1886); Molinari, "Malthus, Essai sur le Principe de Population" (1889); Cossa, "Il principio di populazion di T. R. Malthus" (1895). See ECONOMICS.

MALUS, Etienne Louis, ā-tē-ĕn loo-ē mă lüs, French physicist and military engineer: b. Paris, June 23, 1775; d. there, Feb. 23, 1812. He was educated at the École Polytechnique, and upon leaving the school received a captain's commission in the corps of engineers, and served during the campaign of 1797 with the army of the Sambre and Meuse. Subsequently he participated in the campaign in Egypt, and in 1804 superintended the construction of forti-

fications at Antwerp and Strassburg. Whatever time could be spared from his professional labors was devoted to scientific pursuits. His chief publications consist of a mathematical 'Traité d'Optique,' first published in the 'Mémoires présentés à l'Institut' in 1810, in which he promulgated some valuable discoveries respecting the refraction of light in transparent media; and the 'Theory of Double Refraction' (Mémoires présentés à l'Institut, Vol. II), containing an account of his discoveries respecting the polarization of light, which consisted in showing that light may acquire properties identical with either of two rays yielded by refraction through Iceland spar by the process of simple reflection at a particular angle from any transparent body. This discovery gained for its author his election to the Institute and the biennial medal of the Royal Society of London. He also published an 'Essay on the Measurement of the Refractive Force of Opaque Bodies.'

MALVACEAE, a family of flowering plants, the mallows and their allies, in the order *Columniferæ,* with the calyx gamosepalous; petals contorted in a bud, stamens numerous, monadelphous; anthers extrorse, monothecious; pollen-grains spiny. They are herbaceous or woody plants, mucilaginous in their juices, and usually densely hairy, especially when young. The leaves are palmately nerved and frequently deeply five-lobed. The flowers are large, funnel-shaped, conspicuously and beautifully colored, attracting the aid of insects in fertilization. The fruit is schizocarpous. This family contains many important genera and species of plants elsewhere described, such as the mallows (*Malva, Lavatera,* etc.), hollyhocks (*Althæa*), cotton-plants (*Gossypium*), the rose-mallows (*Hibiscus*), etc. About 60 genera and 900 species are accredited to this family by systematic botanists.

MALVERN, măl-vẽrn, Ark., town and Hot Spring County seat; alt. 315 feet; 43m. SW. of Little Rock, and 22m. SE. of Hot Springs; on Missouri Pacific; and Rock Island railroads. It is in a timber, mineral, and farm area, producing lumber, cotton, clays, barite, titanium ore, and marble. It has a metal plant, two foundries, a shoe factory, and wood products mills. Incorporated in 1872. Pop. (1950) 8,072.

MALVERN, mâl'vẽrn, **Great,** England, a fashionable inland watering-place in Worcestershire, on the east side of the Malvern Hills, at the foot of the Worcestershire Beacon, 1,395 feet high, the summit of which commands magnificent views. A restored 11th century priory church and Malvern College are the chief edifices. Malvern is widely celebrated and greatly frequented owing to its salubrious climate and the efficacy of its mineral springs. Pop. of urban district about 17,000.

MALVERN HILL, Battle of. After the close of the battle of Glendale (q.v.), June 30, 1862, the Army of the Potomac was put in position on Malvern Hill, an elevated open plateau on the left bank of James River, 60 feet high, and about 1½ miles by ½ mile in area. On this plateau the army was disposed in a large arc, both flanks resting on the river and protected by gunboats. Porter's Fifth corps was on the left, Couch's division of Keyes' corps on the right of Porter, Heintzelman's two divisions—Kearny and Hooker—on the right of Couch, Sumner's corps on the right of Heintzelman, and Franklin's corps on the right of Sumner. Peck's division of Keyes' corps was on the right of Franklin and was the extreme right of the army, and it and the left of Porter's line stood back to back. There were numerous batteries of artillery along and in rear of the line. The position was a very strong one: the Confederate D. H. Hill says: "Tier after tier of batteries were grimly visible on the plateau rising in the form of an amphitheatre." The approach to the position was over 400 to 500 yards of open ground swept by artillery fire. When it was discovered early in the morning of July 1 that McClellan had fallen back from Glendale during the night Lee gave orders for immediate pursuit. Jackson marched by the Willis road, and when in sight of Malvern Hill he formed line, with Whiting's division on his left and D. H. Hill's on his right, one of Ewell's brigades occupying the interval. The rest of Ewell's division and Jackson's own division were held in reserve. Magruder was directed to take position on Jackson's right, but before his arrival two of Huger's brigades came up and were placed next to Hill. The Confederates felt the Union lines with infantry and artillery, and when Magruder came up, about 2 P.M. Huger's two brigades—Armistead and Wright—with four batteries, were ordered forward. The batteries, as they emerged in succession from the woods, were promptly knocked to pieces by the fire of over 60 guns brought to bear upon them, and the two brigades were repulsed with loss. This attack fell upon the right of Porter and left of Couch, and the latter was now reinforced by Caldwell's brigade of Sumner's corps. No serious advance had been made on other parts of the line, but Hill had suffered severely from artillery fire in getting his troops in position opposite Couch's right. At 5:30 P.M. Magruder assaulted Porter's line and the left of Couch with the five brigades of Armistead, Cobb, Wright, Mahone and Barksdale. All were met by such a terrific fire of artillery and musketry, which swept the slope of the hill, that they could make no headway, though gaining temporary advantages, and fell back with great loss. Toombs', G. T. Anderson's and Ransom's brigades were now ordered in; Toombs got lost in the thick woods; Anderson and Ransom shared the fate of those preceding them, and fell back. Magruder's fight ended before dark. While Magruder was thus engaged with Porter and the left of Couch, D. H. Hill, on his left, advanced against Couch's right, which, as the action progressed, was reinforced by Caldwell's brigade, three regiments of Hooker's division under Sickles and some of Kearny's division. Hill's five brigades were commanded by Generals Garland and Ripley and Cols. J. B. Gordon, A. H. Colquitt and C. C. Tew. The slope to Couch's line was about 800 yards, without cover, and the advance directly in the face of guns on the slope and bristling on the summit, from which burst forth such a terrific fire of shell and canister that Hill's brigades withered under it. Toombs' brigade was picked up and sent to their support, but the six brigades were hurled back, some in great disorder after the loss of half their men.

Later in the evening Taylor's brigade of Ewell's division, on Hill's left, moved against the left of Kearny's division, and was repulsed by artillery fire alone.

Half an hour after Hill had been disastrously repulsed and his troops scattered, McLaw's division of two brigades—Semmes and Kershaw—came up and assaulted Porter's right. Semmes made some headway up the slope, but was met by the 69th and 88th New York of Meagher's brigade, which Sumner had sent to Porter's assistance, and was repulsed after a hand-to-hand encounter. Kershaw, on Semmes' left, was likewise repulsed, and his repulse at twilight marked the close of the battle, but it was 9 o'clock before the firing ceased and quiet settled down on the bloody field.

Sixteen Confederate brigades had heroically thrown themselves against the Union left, but were repulsed by the artillery and nine brigades. Advanced regiments were forced back, but generally recovered ground; batteries or parts of batteries were withdrawn, but again run forward; yet "never for an instant was the Union line broken or the guns in danger." The Confederate loss was over 5,500; Jackson's four divisions had 2,301 killed, wounded and missing; Magruder and Huger about 2,900. The Union loss was less than 2,000.

E. A. Carman.

MALVERN HILLS, măl'vẽrn hĭls, England, a range of picturesque hills on the borders of Worcester and Hereford shires. It extends north and south for about nine miles, and attains an altitude of 1,395 feet in the Worcestershire Beacon.

MALVERNE, măl'vẽrn, village, New York, in Nassau County, Long Island, 17 miles east of New York, altitude 21 to 37 feet above sea level. It is served by the Long Island Rail Road. The development was originally called Norwood but in 1913 the name was changed to Malverne after Malvern, Eng. The final e was added by mistake in the spelling when the railroad timetable was printed and it has been kept ever since.

Malverne is a non-industrial home-owning community. The schools are modern and well-equipped. There is a public library.

The town was incorporated in 1921. The form of government is representative as laid down in the General Village Law prescribed by New York State. Pop. (1950) 8,086.

MAMARONECK, mă-măr'ō-nĕk, village, New York, Westchester County, altitude 47 feet, on Long Island Sound and the New York, New Haven and Hartford Railroad, 20 miles east by rail from Grand Central Station in New York.

Part of the village, along with the village of Larchmont, is included in the town of Mamaroneck. The section is principally residential, but there are some small local industries. There is a public library. Notable buildings are the library, the municipal building, and the postoffice.

The village's name is Indian, and is variously said to mean "He assembles the people" and "Where the salt water meets the fresh." Settled in the 1650's, the village was incorporated in 1895. It has a mayor and council, and a village manager. Pop. (1940) 13,034; (1950) 15,016.

MAMBAJAO, mäm-bä'hou, municipality, Philippine Islands, in Misamis Oriental Province, situated on the northwestern coast of Camiguin Island, which lies off the northeast coast of Mindanao. Pop. (1948) 25,193.

MAMBER, măm'bẽr, a widely diffused colloquial name for the common wild goat (*Capra aegagrus*) of southwestern Asia. See also Goat.

MAMBUSAO, mäm-bōō'sou, municipality, Philippine Islands, in the Province of Capiz, island of Panay, on the west tributary of the Panay River, opposite Ibajay and 17 miles southwest of Capiz, the provincial capital. Pop. (1948) 18,619.

MAMELUKES, măm'ẽ-lūks (from the Arabic *memalik,* a slave), in Egypt, slaves from the Caucasian countries, who from menial offices were advanced to dignities of state.

In the 13th century the Seljuk Turks, whose greatest chief had been the Sultan Saladin, were masters of Egypt and western Asia. It was a Turkish custom to carry off boys from conquered territories as slaves, and to train them as military bodyguards for the sultans.

Such a bodyguard of white slaves, or Mamelukes, was formed in Egypt. The Mamelukes became an invaluable fighting force; their leaders were taken from their own ranks and in 1250 their commander Kọtuz (Mozaffar Saif aldin) overturned the government, and made himself sultan of Egypt. Ten years later, another Mameluke captain, Bibars (Baybars I, 1233–1277) slew Kọtuz and seized the sultanate. From this time the Mamelukes were masters of Egypt, and successive Mameluke sultans ruled until the conquest of the Ottoman Turks in 1517.

The series is divided into two groups, the Turkish (Bahri, 1250–1390) and the Circassian (Burji, 1390–1517). The succession of each sultan was usually secured by the violent death of his predecessor. Lesser Mameluke chiefs ruled the provinces under a kind of feudal system.

The Mameluke sultans were, on the whole, able rulers, and raised Egypt to great prosperity. They were also patrons of literature, architecture, and other arts. After the Ottoman conquest, Egypt was officially placed under a Turkish pasha, but practically under Mameluke beys, who controlled the several provinces. They formed a fine body of cavalry, and attacked the French, when they landed in Egypt, with the greatest fury; but they were unable to withstand the European artillery, and many of them soon joined the French. The pasha of Egypt, Mehemet Ali, destroyed the Mameluke beys, March 1, 1811, by a perfidious stratagem, and immediately afterward ordered a general massacre of the Mamelukes in every province of Egypt. Some hundreds managed to escape into Lower Nubia, where they built a small town, and endeavored to keep up their force by disciplining Negroes in their peculiar tactics. They did not succeed, however, and shortly afterward dispersed. See also Egypt—*History.*

MAMEY, or **MAMMEE APPLE.** See Mammee Apple.

MAMEY SAPOTA, măm'ē sà-pō'tà, a large tree (*Calocarpum mammosum*) of the family Sapotaceae, native of tropical America. The leaves are large, obovate, glabrous, the flowers small and

inconspicuous and the fruit globose or egg-shaped, rusty brown, and three to seven inches long, with a single large seed. The fruit is very popular in the tropics, especially in Cuba, and is sometimes shipped to the United States. It is eaten fresh, or used for sherbets or marmalade. The tree is grown in Florida and California, but so far not very successfully.

MAMMALIA. See MAMMALS.

MAMMALS, a class of animals, known also as beasts, or quadrupeds, the highest of the vertebrate group in the sense that it comprises forms whose organization is on the whole the most efficient on account of the complexity, or perfection, of the various organs and parts. The diagnostic character of the class is the possession of cutaneous glands, which secrete a complex fluid, called milk, for the nourishment of the young. The lower jaw articulates directly with the cranium, without the mediation of a quadrate bone. The occipital condyles, two in number, form part of the exoccipitals. The internal ear contains a series of three or four separate small bones, which are concerned in audition. The heart is four-chambered, with two auricles and two ventricles; a single left aortic arch; blood warm; red blood discs, not nucleated. A muscular diaphragm separates the heart and lungs from the abdominal cavity. With few exceptions, mammals are clothed with hair, a special outgrowth of the epidermis, and even in these exceptional cases isolated hairs are found at some stage of their life.

Mammals as a class are extremely diversified in size, appearance and habits. The structure of some is modified for a purely aquatic life, of others for burrowing in the earth, for flying, for leaping, for running, etc. Some live entirely in the sea, others pass their lives in the treetops and others in subterranean caverns, which they excavate.

All mammals possess limbs, which are normally four in number, but the hind pair is suppressed in the whales and sea-cows. The limbs assume the form of legs for terrestrial progression, wings for flight or paddles for swimming. The class includes man, and the majority of the animals most useful to man, such as the horse, ox, sheep, goat, dog, cat, etc. It includes also the whales, the largest of existing animals. About 600 genera and 5,000 species of mammals (exclusive of fossil forms) are known, of which about 200 genera and 1,200 species occur in North America, north of Panama.

Integuments.— The skin of mammals consists of two principal layers, a superficial one, called the epidermis or cuticle, and a deeper layer, the dermis or corium. The epidermis is again divided into two layers, an external horny layer and a deeper one, called the Malpighian layer. The epidermis is usually quite smooth, and is beset with hairs which are a special outgrowth of this part of the integument peculiar to the class. The cetacea are without hairs, except a few about the mouth. In the pangolins, the epidermis develops large scales which cover the greater part of the body. Epidermic scales of smaller size are found on the tails of various rodents, insectivores and marsupials. The horns of ruminants, the nasal horn of the rhinoceros and all claws, nails and hoofs are also epidermic structures.

The dermis or corium is generally thicker than the epidermis and contains blood-vessels, tactile nerve endings, sweat glands which open on the surface of the body and fatty tissue. In the whales and seals the fat cells are enormously developed immediately below the dermis and constitute the "blubber." In the armadillos bony plates occur in the dermis, forming a carapace or shell. They are covered by horny sheaths. The presence of small hard tubercles in the skin of certain porpoises gives ground for the belief that the ancestors of the cetacea were covered with a bony armor, somewhat like that of the armadillos.

Hair.— True hairs are found only on mammals. They are simple epidermic structures growing from papillæ sunk in the dermis. They consist of central cellular pith, encased in a horny sheath. In some mammals the sheath is rough, and the hair is then capable of being matted together to form "felt." In the majority of mammals the hairy covering consists of coarse long hairs and fine short hairs intermingled, forming the fur. In the porcupines the coarse hairs assume the form of large stiff spines, or quills; in the hogs they are smaller and more flexible, forming bristles. The hairy covering is usually shed once or twice annually, except in the case of man and of the manes and tails of such ungulates as the horse, the hairs of which may persist throughout life.

The majority of mammals have a number of large, long hairs, or vibrissæ, arranged in a definite fashion about the mouth, eyes and ears, which serve to a certain degree as tactile organs. In deer and some other ruminants the hairs consist mainly of the cellular pith and hence are easily broken.

The color of mammals is chiefly due to the pigments contained in the hair, which belong to the class known as melanins. Black, white and brown in various mixtures and shades are the commonest colors. The coloration is chiefly protective, but some such sharp contrasts of black and white as those of the skunks are thought to be warning colors, and the clear white of the under side of the tail of deer, certain hares, etc., to be directive, or distinguishing, marks for the young.

Skeleton.— The skeleton consists of an axial portion, comprising the skull, the backbone or vertebral column, the ribs and the sternum; and an appendicular portion, or the skeleton of the limbs. In the skull the bones are bound firmly together by the overlapping or interdigitation of the edges, except the lower jaw, the ossicles of the internal ear and the hyoid, or tongue, bones. In adults most of the sutures are usually obliterated. The snout or rostrum consists of the premaxillary, maxillary, palatine and pterygoid bones below and on the sides, and the nasals above, while within are the median vomer and the ethmoid bones. The rostrum abuts against the brain-case or cranium, which is vaulted, and comprises three segments, an anterior one, consisting of the presphenoid, orbito-sphenoids and frontal; a middle segment, consisting of the basisphenoid, alisphenoids, squamosals and parietals; and a posterior segment, consisting of the basi-occipital, exoccipitals and supra-occipital. The exoccipitals bear the two condyles for articulation with the vertebral column. At the base of the skull, between the occipital and squamosal, are

the periotic bones, containing the organ of hearing or internal ear, and the tympanics, which form the bony walls of the orifice of the ear. The tympanics are greatly expanded in whales and some other mammals, forming shell-shaped bullæ.

The vertebral column comprises five sections, the cervical, dorsal (or thoracic), lumbar, sacral and caudal. The cervical vertebræ are seven in number in all mammals, whatever the length of the neck, the only exceptions being the manatees, which have six, and the sloths, which have six, eight or nine. In certain whales, the majority of porpoises and some rodents, the cervicals are more or less united; in the right whales they form a single bony mass. The dorsals vary in number from 9 to 22. Articulated with each is a pair of ribs. The ribs terminate below in cartilages, which sometimes ossify, forming what are called "sternal ribs." By means of these cartilages the anterior pairs of ribs are connected with the breastbone or sternum, which may consist of a single piece, as in the whalebone whales, or of several segments arranged longitudinally. The posterior pairs of ribs are sometimes called "floating ribs" because their cartilages do not meet the sternum, but are attached to those of the more anterior pairs, or are quite free. The lumbar vertebræ follow the dorsals and are without ribs. In number they vary from 2 to 30 in different forms. The number of dorsal and lumbar vertebræ combined is quite constantly 23 in the odd-toed ungulates (horse, rhinoceros, tapir, etc.), 19 in even-toed ungulates (deer, ox, sheep, etc.), and 20 or 21 in carnivores and most insectivores. Man, the higher apes and many bats have 17. Following the lumbars is the sacrum, consisting usually of three vertebræ joined together and connected with the pelvis. This region is not distinguishable in the whales and sea-cows, which lack hind limbs. The caudals, or tail-vertebræ, complete the column. In man and in certain apes and bats they are three in number and rudimentary, but as many as 46 are present in the long-tailed pangolins. In the intervals between the anterior caudals below are situated small V-shaped bones, called chevrons, whose chief function is to protect the larger blood-vessels of the tail. They are especially well developed in the whales and edentates.

In many groups of mammals the anterior limbs are connected with the axial portion of the skeleton through the pectoral girdle, consisting of the shoulder blades, or scapulæ, and the collar-bones or clavicles. The scapula is not attached directly to the vertebral column, but its acromion process is joined to the anterior end of the breastbone, or sternum, by means of the clavicle. Clavicles are wanting in all seals, whales, sea-cows and ungulates, and are rudimentary or wanting in various representatives of several other groups. They are present in man and, with one or two exceptions, in all monkeys, bats, insectivores and marsupials. The upper-arm bone, or humerus, articulates superiorly with the scapula, and below with the two bones of the fore-arm, the radius and ulna. In the majority of mammals the radius, or outer bone, is permanently crossed over the ulna at the lower end, as is especially well seen in the elephants. In man and a few other forms the radius can be rotated. Following the fore-arm is the wrist or carpus, consisting of three rows of small bones, which, however, are variously united in different forms; and finally the digits, which are normally five in number, each consisting when fully developed of a metacarpal bone and three other bones, or occasionally more, called phalanges, though the first digit, or thumb, usually has but three in all. In man and apes the thumb is opposable to the other digits. In many mammals this digit and also the fifth are greatly reduced, or entirely wanting. In the ruminants, such as the pig, ox, deer, camel, etc., the first digit is wanting, and the second and fifth are reduced in size, or entirely lacking, while the third and fourth are equal in length and well developed. In the odd-toed ungulates, such as the horse, rhinoceros, tapir, etc., the third digit is longest, the others being reduced in length, rudimentary or wanting. In ungulates the metacarpals are usually much elongated and in such ruminants as the deer, ox, etc., are united, forming what is known as a "cannonbone." The cetacea are peculiar in that the bones of the fore-limb are not movably articulated and that the phalanges of the middle digits often greatly exceed three. In bats the phalanges are very greatly elongated to give support to the wing membranes.

The hind-limb is connected with the vertebral column through the pelvic girdle, which is united with the sacrum. The bones of the hind-limb, which are homologous to those of the fore-limb, are the femur or upper leg-bone, the tibia and the fibula or lower leg-bone, the tarsal or ankle bones and the metatarsals and phalanges constituting the hind-foot. The peculiarities of the bones of the fore-feet in ungulates, already mentioned, are found also, with only slight modifications, in the hind-feet.

The terminal phalanges of both fore and hind feet are compressed and pointed in beasts of prey and such as climb or dig, forming claws, which are covered with horny sheaths. In large running mammals, the terminal phalanges are more or less broad and flat and likewise covered with horny sheaths, forming hoofs or nails. Certain bones not connected with the skeleton, such as the *os penis, os cordis,* etc., are developed in the viscera of various mammals.

Teeth.— In mammals, unlike the lower vertebrates, teeth are not produced indefinitely, but in fixed number. At most two visible sets are developed. Traces are found, however, of at least one pre-milk and one post-permanent dentition. The first, called the milk dentition, appears during infancy, being replaced by the second set, called the permanent dentition, as maturity is reached. The milk teeth are less numerous and usually smaller than those of the permanent set. Teeth occur only in the premaxillary and maxillary bones and the mandibles or lower jaw. The upper teeth are divided into incisors, which are implanted in the premaxillæ; canines, which are almost invariably simple and stand immediately behind the suture between the premaxillæ and maxillæ; and premolars and molars, which occupy the edges of the maxillæ. The premolars have "milk" predecessors, while the molars have not. The nomenclature of the teeth of the lower

jaw is the same as for those of the upper jaw, their character being determined by their relation to the latter and by their form and mode of development. While the greatest diversity exists as to the form of the individual teeth, and the development of the dentition as a whole, there are rarely more than 44 in all. The exceptions are among the marsupials, where the number rises to 54 in the marsupial anteater, *Myrmecobius,* and to 64 in a fossil form *Amphitherium;* also among the cetacea, one species of which has as many as 246 simple teeth. The true anteaters, *Myrmecophagidæ,* and the spiny anteaters of Australia, *Echidna,* are without teeth at any time, but many mammals which do not possess them when adult have rudimentary teeth in the fœtal stages. Such is the case with the whalebone whales, and with the platypus, *Ornithorhynchus.* The rudimentary teeth in these disappear early and are replaced by whalebone in the case of the whales, and by horny plates resembling teeth in the platypus.

Teeth consists of two portions, the root and the crown. When most complex they contain three structural elements, the enamel, the dentine and the cement. The enamel is hardest and is restricted to the crown, while the dentine makes up the mass of the tooth, and the cement usually surrounds the root, or fills spaces between the enamel-folds of the crown. The enamel develops from the epithelial tissue of the jaws, the dentine from the deeper-lying areolar tissue and the cement from the walls of the tooth-capsule. Some teeth, such as the incisors of rodents, the tusks of the elephant, etc., grow continuously during life; other complete their growth early. Especially remarkable forms of teeth are the tusks of elephants, which are incisors, and the tusks of the narwhal, the boar and the babirussa, which are canines. When the crowns of the teeth greatly exceed the roots in height, as in the horse, the teeth are said to be hypsidont or hypselodont; when the reverse is the case, the teeth are called brachydont. Teeth having the crown in the form of tubercles, as in the hog, are called bunodont; those with transverse ridges, as in the ox, many rodents, etc., are called lophodont.

Alimentary Canal.—The mouth, or entrance to the alimentary canal, contains the tongue, which in the majority of mammals is so attached below that it can be protruded but a short distance, but is often sufficiently free to be used in grasping food and turning it about in the mouth during the process of mastication. In those mammals which feed upon ants and termites, such as the anteaters, pangolins, etc., and also in certain fruit-eating bats, the tongue is very long and slender and can be extended far beyond the mouth. On the posterior surface of the tongue are the organs of taste, and the upper surface is often roughened by horny papillæ. A number of large glands, called salivary glands, open into the mouth. Their function is to moisten the food and initiate the process of digestion. The glands most constantly present are the parotid, situated at the base of the ear, and opening inside the cheek, and the submaxillary, situated near the angle of the lower jaw, and opening under the apex of the tongue. At the back of the mouth is the entrance to the œsophagus or gullet, usually a simple tube, leading to the stomach. The stomach is an oblong, curved sac, usually enlarged at the cardiac end where the œsophagus is attached, and smaller at the lower, or pyloric, end, where it joins the intestines. It is usually simple, but in the ruminants and the cetaceans consists of several chambers. The intestines join the stomach at the pyloric end. They are usually of great length, and divided into two distinct sections. The portion nearest the stomach, called the small intestine, is joined below by one of larger diameter called the large intestine. The upper end of the latter is frequently dilated, forming a pouch called the cæcum, which in herbivorous mammals, and notably in rodents and many ungulates, is greatly enlarged or elongated. In man, the higher apes and the marsupial wombat it terminates in a narrow prolongation called the vermiform appendix. Different sections of the small intestine have received the names duodenum, jejunum and ileum; and of the large intestine, colon and rectum. The inferior orifice of the intestines is the anus or vent. Generally speaking, the intestines and cæcum are shortest in carnivorous mammals and longest in such as are vegetable feeders, but the carnivorous whales and seals, which have long intestines, form a conspicuous exception.

Besides the numerous glands situated within the intestine are two large ones, the liver and the pancreas, whose ducts open into the intestines near the stomach. The liver is a large, flat gland, which may be divided nearly into a right and a left lobe as in man, the cetacea and ruminants, or may have these lobes again subdivided into two by a longitudinal fissure. Two smaller lobes, called the Spigelian lobe and the caudate lobe, are commonly added. Attached to the liver is the gall-bladder, which is, however, absent in the cetacea and some other orders.

Kidneys.— The kidneys, whose function is to secrete urine, are situated in the upper part of the abdominal cavity near the vertebral column. They are two in number, oblong and usually simple, but in the cetacea, and also in bears and seals, are divided into separate lobules. A duct or ureter leads from each kidney to the urinary bladder, from which in turn a common duct, called the urethra, leads to the exterior of the body. In the monotremes, however, the ureters do not enter the bladder, but into a common urogenital passage or cloaca.

Lungs.— The lungs are situated in the thorax, which is cut off below from the abdominal cavity by a muscular diaphragm whose action assists in the process of breathing. The lungs consist of two spongy lobes, a right and a left, which are free below, but attached above to the two principal divisions of the windpipe. In the cetacea and sea-cows, the lobes are simple externally, but in other orders are more or less subdivided. A third median lobe, called the azygos lobe, is present in some groups. Air breathed in through the nostrils reaches the lungs through the trachea or windpipe, the upper end of which, the larynx, lies in the throat. Its orifice, the glottis, is protected by a cartilage, called the epiglottis, which prevents particles of food from entering the windpipe. The larynx is made up of cartilages, of which the largest are the thyroid, the cricoid and the arytenoid. Within the larynx are the vocal cords, two parallel elastic, fibrous bands, whose

vibrations produce the voice. The lower end of the windpipe divides into two smaller tubes, or bronchii, each of which enters a lobe of the lungs and subdivides into numerous smaller branches. A third bronchius, which enters the right lung, occurs in some cetaceans and ruminants.

Heart.—The heart in mammals is four-chambered, consisting of two thin-walled auricles and two ventricles, both with thick walls, but the right, which supplies only the lungs, thinner than the left. There is no direct communication between the left and right sides of the heart after birth. The valve between the right auricle and the right ventricle is tendinous, except in the monotremes.

The aorta, or principal artery, bends toward the left immediately beyond its connection with the heart and gives off the innominate, left common carotid, and subclavian arteries, which, with their branches, supply the head and anterior limbs. The method of branching of these arteries from the aortic arch and from one another varies widely. Blood is carried from the alimentary canal to the liver by a single vein, except in Echidna, in which as in lower vertebrates the abdominal vein is present. The kidneys are supplied with blood only by the renal arteries.

Brain.—Except for certain fossil forms, the brain of mammals is characterized by its relatively larger size as compared with that of lower vertebrates, and especially by the magnitude of the cerebral hemispheres and the perfection of the connections between them. In most mammals the surface of the brain is divided by numerous irregular fissures and convolutions. They are absent only in small bats, rodents and insectivores, and in *Ornithorhynchus*. The largest forms in each order, generally speaking, exhibit the greatest complexity, and there has been a remarkable development in the class in this direction since Tertiary times. The cetacea have very large and complex brains, though they are small relatively, when compared with the size of the body.

Sense Organs.—The organs of sense, except that of touch, are located in the head. The sense of touch is generally distributed over the skin, but is most acute in the snout, and in the extremities, except when used merely in locomotion. The wings of bats and the prehensile tails of monkeys are also especially sensitive. Some burrowing mammals, such as the mole, have imperfect eyes, the optic nerve being more or less atrophied. The Indian river-dolphin, *Platanista*, is a blind form, having rudimentary eyes, without crystalline lenses. The mammalian ear is characterized, besides the chain of ossicles, already mentioned, by the complex cochlea, which is usually spirally convoluted. The tympanic membrane, or eardrum, seals the auditory chamber from without. In the majority of mammals the external orifice of the ear is surrounded by a fold of skin, called the pinna or external ear. These are absent in cetaceans, sea-cows, seals, etc., which live in the water, and also in some burrowing mammals.

Reproductive System.—In mammals the female reproductive organs comprise the ovaries, Fallopian tubes or oviducts, uterus and vagina. The ovaries are two in number, a left and a right. Approximated to them are the Fallopian tubes, which widen below and form the uterus. In the lower mammals the uterus of each side is separate, but the two unite below in a common vagina, while in the higher groups, the uterus and vagina are both single. The male organs comprise the testes, spermatic cord and penis. In cetaceans, sea-cows and seals, which are aquatic, and in the elephants, conies and many edentates, the testes are internal in position, but in most other forms they descend periodically, or permanently, into a pouch of the integument, called the scrotum. The structure of the penis in mammals is peculiar to the class. An *os penis* is present in the majority of bats, insectivores, rodents, carnivores and primates.

During development the mammalian fœtus is nourished through a complex structure, called the placenta, formed in part by the internal wall of the uterus of the mother and in part by the membranes of the fœtus itself. The placenta is characteristic of the class as a whole, but is not found in the monotremes, nor in most marsupials. The form and other characteristics of the placenta differ in the several orders of mammals and are regarded as of importance in classification.

Distribution.—The geographical distribution of existing mammals, as of other animals, is the result of varied conditions and influences, some transient and others of long continuance, beginning in the relatively remote geological times when the class first made its appearance. Among the principal factors in the problem of distribution may be included changes in the extent and configuration of the land areas of the globe, changes in climate and in food supply, the appearance and disappearance of enemies, and latest, but by no means least, the interference of man. These and other factors in distribution are considered under the heading DISTRIBUTION OF LIVING MAMMALS. It is only possible here to mention some of the more important facts in the distribution of mammals. Of widest distribution are the purely aquatic orders, the cetacea and pinnipedia, whose range covers all seas and reaches from pole to pole, but it should be noted that no sea-lions occur in the north Atlantic. Next follow the bats, whose range is nearly world-wide, but they do not enter the Antarctic zone, and only very few species cross the Arctic Circle. On the other hand, they are found in New Zealand and in oceanic islands where no terrestrial indigenous mammals occur. Of the purely terrestrial orders, the rodents have the widest range, covering every continent and reaching from the Arctic zone to Patagonia and Tasmania. Carnivores, like rodents, have an almost world-wide distribution, but in Australia only one species of the order occurs, the dog known as the "dingo," *Canis dingo;* and it is uncertain whether this may not have been introduced by man at a remote date. The monotremes (comprising only the genera *Ornithorynchus, Echidna* and *Proëchidna*) are limited to Australia, Tasmania and New Guinea. Marsupials occur only in Australia, Tasmania, New Guinea and America. The American marsupials, with the exception of one genus, all belong to the family *Didelphiidæ*, or the opossums. Edentates occur only in America, southern Asia and Africa. They have their greatest development in South America. One genus, *Tatu*, extends northward

into Texas. Ungulates inhabit all continents except Australia, but only two or three species enter South America. Of the two groups forming the order *Primates,* the lemurs and lemuroids occur only in Madagascar, Africa and southern Asia, while monkeys inhabit only Africa, southern Asia and South and Central America. One ape, *Macacus inuus,* is found at Gibraltar, but it is only doubtfully indigenous.

Fossil Mammals.— Mammals are believed to have originated as an offshoot from certain Permian and Triassic reptiles called *Theromorpha* or *Anomodontia.* The earliest recognizable remains of mammals are certain small teeth and jaw-bones found in the Triassic formations. They belonged to forms resembling monotremes and marsupials in some characters, but are usually placed in a separate order, called *Allotheria* or *Multituberculata.* Representatives of the *Allotheria* continued on through the Jurassic and Cretaceous. The existing orders of mammals first appear in the Eocene, the lowest formation of the Tertiary period, being foreshadowed in the lowest beds of that period by certain generalized groups such as the *Creodonta* and *Condylarthra.* The Eocene also contains remains of several groups, or suborders, of ungulate mammals, which have no living representatives. These are the *Ancylopoda, Typotheria* and *Toxodontia.*

The later Tertiary and the Quaternary periods show a greatly increased number and diversity of forms. Many of them represent families which persisted for only a relatively short period and are now extinct; others have continued to the present. Among the oldest of existing genera are *Didelphis* (opossum), *Sciurus* (squirrel), *Myoxus* (dormouse), *Sorex* (shrew), *Vespertilio* and *Vesperugo* (bat) and *Viverra* (civet), which originated in the Eocene; *Tapirus* (tapir), *Rhinoceros, Giraffa* (giraffe), *Elephas* (elephant), *Sus* (pig), *Talpa* (mole), *Erinaceus* (hedgehog), *Mustela* (marten), *Lutra* (otter), *Hyæna, Felis* (cat) and *Phoca* (seal), which originated in the Miocene.

Classification.— The class *Mammalia* was divided by Linnæus into three principal sections, *Unguiculata, Ungulata* and *Mutica.* The last comprises the cetaceans, the second all the ungulates except the elephant, and the first, the remainder of the class. This classification was replaced by Blainville, who proposed on embryological grounds to divide the class into *Monodelphia,* or mammals with a placenta; *Didelphia,* or mammals without a placenta (the marsupials) and *Ornithodelphia,* or the monotremes. Richard Owen combined the last two subclasses under the name of *Eplacentalia* and gave the placental mammals the name of *Placentalia.* Speculation as to the origin of the class as a whole led Huxley to propose as the source a hypothetical group which he named *Hypotheria,* the characters assigned being the absence of milk glands and of a corpus callosum in the brain and the presence of a quadrate bone for the articulation of the mandible. Existing mammals were divided into *Prototheria,* comprising the monotremes, *Metatheria,* the marsupials, and *Eutheria,* the so-called placental mammals. Cope in 1889, while retaining the subclass *Prototheria* for the monotremes, placed the entire remainder of the class in the subclass *Eutheria.* Flower and Lydekker (1891) adopt Huxley's divisions, while Beddard (1902) makes use of those of Cope. Flower and Lydekker's arrangement of families and higher groups is as follows (fossil groups printed in italics):

Subclass 1. PROTOTHERIA.
- Order 1. Monotremata (Monotremes).
  - Families: Ornithorhynchidæ, Echidnidæ.
- (Group, *Multituberculata* or *Allotheria.*
  - Families: *Plagiaulacidæ, Polymastodontidæ, Tritylodontidæ*).

Subclass 2. METATHERIA.
- Order 2. Marsupilia (Marsupials).
  - Suborder 1. Polyprotodontia.
    - Families: *Dromatheriidæ, Amphitheriidæ, Spalacotheriidæ,* Didelphyidæ, Dasyuridæ, Peramelidæ.
  - Suborder 2. Diprotodontia.
    - Families: Phascolomyidæ, Phalangeridæ, *Diprotodontidæ, Nototheriidæ,* Macropodidæ.

Subclass 3. EUTHERIA.
- Order 3. Edentata (Edentates).
  - Families: Bradypodidæ, *Megatheriidæ,* Myrmecophagidæ, Dasypodidæ, *Glyptodontidæ,* Manidæ, Orycteropodidæ.
- Order 4. Sirenia (Sea-cows).
  - Families: Manatidæ, *Rhytinidæ,* Halicoridæ, *Halitheriidæ.*
- Order 5. Cetacea (Cetaceans).
  - Suborder 1. Mystacoceti (Whalebone whales).
    - Family: Balænidæ.
  - Suborder 2. *Archæoceti.*
    - Family: *Zeuglodontidæ.*
  - Suborder 3. Odontoceti (Toothed whales).
    - Families: Physeteridæ, Plaatanistidæ, Delphinidæ.
- Order 6. Ungulata (Hoofed mammals).
  - Suborder 1. Artiodactyla (Even-toed ungulates).
    - Families: Hippopotamidæ, Suidæ, *Chæropotamidæ, Anthracotheriidæ, Merycopotamidæ, Cotylopidæ, Anoplotheriidæ, Dichodontidæ,* Tragulidæ, Camelidæ, *Poebrotheriidæ,* Cervidæ, Giraffidæ, Antilocapridæ, Bovidæ.
  - Suborder 2. Perissodactyla (Odd-toed ungulates).
    - Families: Tapiridæ, *Lophiodontidæ, Palæotheriidæ,* Equidæ, Rhinocerotidæ, *Lambdotheriidæ, Chalicotheriidæ, Titanotheriidæ, Macraucheniidæ.*
  - Suborder 3. *Toxodontia.*
    - Families: *Toxodontidæ, Typotheriidæ.*
  - Suborder 4. *Condylarthra.*
    - Families: *Periptychidæ, Phenacodontidæ, Meniscotheriidæ.*
  - Suborder 5. Hyracoidea (Conies).
    - Family: Hyracidæ.
  - Suborder 6. *Amblypoda.*
    - Families: *Pantolambdidæ. Coryphodontidæ, Uintatheriidæ.*
  - Suborder 7. Proboscidea (Elephants).
    - Families: *Dinotheriidæ,* Elephantidæ.
  - (Group *Tillodontia*).
    - Families: *Anchippodontidæ, Calamodontidæ*).
- Order 7. Rodentia (Rodents).
  - Suborder 1. Simplicidentata.
    - Families: Anomaluridæ, Sciuridæ, Haplodotidæ, *Ischyromyidæ,* Castoridæ, Myoxidæ, Lophiomyidæ, Muridæ, Spa-

lacidæ, Geomyidæ, Dipodidæ, *Theridomyidæ*, Octodontidæ, *Castoroididæ*, Hystricidæ, Chinchillidæ, Dinomydæ, Caviidæ, Dasyproctidæ.
Suborder 2. Duplicidentata.
Families: Lagomyidæ, Leporidæ.
Order 8. Carnivora (Carnivores).
Suborder 1. Carnivora vera (Fissipeds).
Families: Felidæ, Hyænidæ, Protelidæ, Viverridæ, Canidæ, Ursidæ, Mustelidæ, Procyonidæ.
Suborder 2. Pinnipedia (Pinnipeds).
Families: Otariidæ, Trichechidæ, Phocidæ.
Suborder 3. *Creodontia.*
Families: *Hyænodontidæ, Proviverridæ, Arctocynidæ, Mesonychidæ.*
Order 9. Insectivora (Insectivores).
Suborder 1. Insectivora vera.
Families: Tupaiidæ, Macroscelididæ, Erinaceidæ, Soricidæ, Talpidæ, Potamogalidæ, Solenodotidæ, Centetidæ, Chrysochloridæ.
Suborder 2. Dermoptera.
Family: Galeopithecidæ.
Order 10. Chiroptera (Bats).
Suborder 1. Megachiroptera.
Family: Pteropidæ.
Suborder 2. Microchiroptera.
Families: Vespertilionidæ, Nycteridæ, Rhinolophidæ, Emballonuridæ, Phyllostomatidæ.
Order 11. Primates.
Suborder 1. Lemuroidea (Lemurs and Lemuroids).
Families: *Hyopsodontidæ,* Chiromyidæ, Tarsiidæ, Lemuridæ.
Suborder 2. Anthropoidea (Monkeys and Man).
Families: Hapalidæ, Cebidæ, Cercopithecidæ, Simiidæ, Hominidæ.

The groups of existing mammals whose structural peculiarities are such as to entitle them to rank as separate families vary greatly as regards the number of genera and species they comprise, some being represented by a multitude of different forms, while others consist only of a single species, or a single genus with but a few species. Families consisting of only a single genus and species are as follows: The Chiromyidæ, established for the reception of the Aye-Aye, a singularly modified lemuroid mammal, confined to Madagascar; the Dinomyidæ, comprising only a large Peruvian rodent, somewhat like a paca, of which a single specimen is known; the Antilocapridæ, represented only by the Prong-horn of the western plains of North America; the Notoryctidæ, comprising only a small mole-like marsupial recently discovered in South Australia; the Ornithorhynchidæ, comprising only the Platypus, or Duck-bill, of Australia. These and other restricted families are to be looked upon as fragments of groups of genera and species, of which the greater number are extinct, or as branches from main lines of development which have never progressed and ramified.

MAMMARY GLANDS, the milk-glands of mammalian animals (see BREAST). They are present in all mammals, in both sexes, but in the male are usually rudimentary, their functional activity being limited to the female, who secretes in these glands the milk for nourishing her young during a natural period after birth. In all mammals they are placed in pairs, but vary much in position and number in different groups. Zoologists give them names according to their position near the armpits (axillary), on the chest (pectoral), on the belly (ventral or abdominal), or near the groin (inguinal). They are never situated on the back. The number in an individual may be from 2 to 12 or more, and is usually even. The structure of the cow's udder is due to the uniting of the same number of mammæ as there are of teats, the number of which, when more than two, usually corresponds to that of the young produced at each birth. The mammary glands of Marsupialia (q.v.) are contained in the pouch. In monotremes — duck-bills and echidnas — the nipple is not present. (See PROTOTHERIA).

Diseases of the Mammary Glands.— The common inflammation of the glands (mastitis) is often attended by much swelling, with fever and painful tenderness. The formation of pus is apt to result in a slowly pointing abscess. Great care in diet and regulation of the bowels should be observed. Purgatives and fomentations may be necessary, also in many cases the placing of the arm on the affected side in a sling. Drawing off the milk and evacuating the pus may be practicable and will afford great relief. Pain in the breasts (mastolynia) may result from many causes, of which sore nipples is one of the most frequent. The nipples are also subject to cracks, ulcerations, etc., which occasion much difficulty and pain to the mother when suckling the child. Lotions of an astringent character, as tannin, etc., have a remedial effect in such disorders, as have also collodion and lunar caustic (nitrate of silver), when applied to the sore nipple. Metallic shields are used in severe cases for protection of the affected point. Among many specific disorders to which the mammary glands are liable are cancer and galactocele and other forms of tumor. See MILK FEVER.

MAMMEE APPLE, or **SOUTH AMERICAN APRICOT,** the fruit of a clusiaceous tree, bearing white, showy, fragant flowers, growing naturally in tropical America, but largely cultivated in tropical parts of the Old World. The fruit is several inches in diameter, with a double rind and a yellowish pulp like that of an apricot, which is sweet and nourishing and is eaten raw or with wine and sugar or is boiled. A spirituous liquor called Eau Créole is distilled from its flowers; and the gum exuding from the bark is used by the Central Americans for destroying chigoes in the feet. This gum-resin is similar to the "gamboge" derived from a closely related West African tree (*Garcinia hamburyi*).

MAMMON, a term popularly held to be a mere personification of riches. It is used in

Matt. vi, 24 and Luke xvi, 9. Milton makes Mammon a fallen angel of sordid character.

MAMMOTH, an elephant (*Elephas primigenius*) which inhabited the temperate parts of the northern world during the Glacial period, and at its close spread northward with the retreat of the ice, and survived until the Neolithic period of human history. Some account of the origin and probable wanderings of the species is given in the paragraph relating to fossil elephants under ELEPHANT. Mammoth remains have been found in intimate association with the handiwork of savage man; and upon a piece of bone a portrait of this animal was found scratched, the accuracy of which shows a close acquaintance by the Cave-dwellers of France with the animal in life, and much artistic skill. This elephant, although the word "mammoth" has become an expression for hugeness, was little if any larger, on the average, than the modern Asiatic elephant, to which it was nearly related. Its remains are abundant and enable us to reconstruct its form and features completely, especially since the remarkable discovery, first in 1799, of carcasses frozen into the icy cliffs along the Arctic coast of Siberia. One of the most important discoveries of this kind occurred in 1801. Since the earliest known times ivory from buried tusks of these animals has been obtained from northern Siberia and Alaska, and many curious stories were invented to account for its origin, especially among the Chinese, who had never seen an elephant; but the specimens above mentioned contained not only the tusks still in their sockets and every bone in its place throughout the skeleton, but a great part of the flesh was in a condition fit for sledge-dogs to eat and enjoy, and was covered with thick skin still clothed with long dark hair, beneath which was a dense woolly fur, well fitted to protect the animal against arctic cold. The ears were much smaller than those of modern elephants. This specimen of 1801, which is preserved in the Royal Museum at Saint Petersburg in the attitude in which it was found buried, measured 16 feet 4 inches from the forehead to the extremity of the tail; its height was 9 feet 4 inches, and the tusks, along the outer or greater curve, measured 9 feet 6 inches. Of other well-known specimens, that skeleton mounted in Chicago is one of the largest known, and its tusks measure 9 feet 8 inches. The largest tusks on record are a pair found in Alaska which measure 12¾ feet in length. All mammoth tusks show an outward and upward sweep very distinct from the growth of elephant tusks. The mammoth seems to have been extremely numerous all over northern Europe, Asia and North America, especially during post-glacial times, when northern Asia was covered with pine forests to the borders of the Arctic Sea, affording plentiful food in their leaves and twigs upon which these animals browsed. The disappearance of these forests, due to slow climatic changes, is supposed to be the principal influence which led to the extermination of the species, a fact otherwise not easily to be explained. It is probable that human hunting had much to do with the mammoth's final disappearance. (See also ELEPHANTS; FOSSIL). Consult Beddard, F. E., 'Mammalia' (New York 1902); Lucas, F. A., 'Animals of the Past' (ib. 1901); Scott, W. B., 'History of Land Mammals in the Western Hemisphere' (ib. 1913); Herz, O. F., 'Frozen Mammoth of Siberia' (Washington 1904). See MASTODON.

MAMMOTH CAVE, Ky., a remarkable American cavern, in Edmondson County, 85 miles southwest of Louisville, reached by a small branch line connecting at Glasgow Junction with the Louisville and Nashville Railroad. Its areal diameter is about 10 miles, and about 100 miles of passageway have been explored, including avenues, chambers, pits, domes and rivers. What is termed the Main Cave is three miles long, varying in width from 40 to 175 feet and in height from 40 to 125 feet. Its greatest enlargement is known as the Chief City (or Temple), an oval room 541 feet long, 287 feet wide and 125 feet high; anciently a rendezvous of the Indians, whose torches and other relics have been found in abundance. The Star Chamber mimics the starry heavens by reason of its lofty ceiling of black oxide of manganese flecked by snowy crystals of gypsum. The cavern exists in five successive tiers, through which, at various points, shafts have been cut, which are styled pits or domes, according to the point of view. The largest are the Bottomless Pit, Gorin's Dome, the Mammoth Dome and the Maelstrom, and their average depth is about 100 feet. Oval depressions, locally known as "sink-holes," drain through the pits and chasms and form subterranean lakes and rivers; which finally find an outlet to the neighboring Green River. The largest, the Echo River, gets its name from the wonderful reverberations of sound along its course. Boats are provided for short voyages. Eyeless fish abound, of which there are three or four species; besides, blind crawfish, blind crickets, flies, beetles and spiders and other abnormal fauna are found on the walls and under the rocks. The structure and habits of these animals have been studied with great care.

Beyond River Hall long avenues extend, many adorned by marvelous gypsum rosettes and brilliant arches of crystal efflorescence in the most fantastic diversity. Cleveland's Cabinet is frequently mentioned as a treasure-house of cave flowers, but some of the smaller rooms, for instance, Charlotte's Grotto, can boast of finer displays. The great cavern is said to end at Croghan's Hall, where is the Maelstrom already mentioned, but the few who have dared go to the bottom of this profound abyss report wide and long avenues beyond, which are yet to be explored. Everywhere, even in the deepest pits, the atmosphere is both chemically and optically pure; the temperature is uniformly about 54° F. all the year around, as has been determined by a long series of exact scientific observations, in order to discover the temperature of the crust of the earth.

The discovery of the Mammoth Cave is usually credited to a hunter named Hutchins, in 1809; but the present manager of the estate finds that the county records, in 1797, fix the entrance to this cavern as a landmark for a piece of real estate. The locality first gained notoriety by reason of its immense deposits of saltpeter, which were used in the manufacture of gunpowder during the War of 1812. After passing through the hands of several owners, the cave was bought by Dr. John Croghan, who

willed it to his nephews and nieces, with instructions that at their death it should be sold at auction. The acquisition of an area of over 70,000 acres, to be known as Mammoth Cave National Park, was authorized by Congress in 1926. See also CAVE; CAVE ANIMALS.

MAMMOTH HOT SPRINGS. See YELLOWSTONE NATIONAL PARK.

MAMO, a bird (*Drepanis pacifica*) of the Hawaiian Islands, related to the creepers, and now nearly extinct because of the great demand in past years for their yellow feathers for making the feather-cloaks formerly worn as insignia of royalty by the chiefs. Other birds supplied certain other required feathers. Very few of these cloaks remain in museums.

MAMORÉ, mä-mō-rā′, a river of Bolivia which has its rise in the Cordillera Real, near Sucre, and flows first east by south, then forms almost a semi-circle toward the north to Trinidad, from where its course is nearly north to where it unites with the Beni and forms the Madeira River. In the first part of its course it is called Rio Grande. The Mamoré is about 1,300 miles long and navigable for about 1,000 miles, with some obstructions. About 40 miles above its junction with the Beni are the Guajara Falls, above which navigation is free for about 400 miles to places where fallen logs have filled in between the banks and formed dams.

MAMPALON, an aquatic animal (*Cynogale bennetti*) of Borneo, of the civet family. It is otter-like in form, is about 18 inches long, has stout webbed plantigrade feet and is thoroughly adapted to an aquatic life while retaining purely viverrine characteristics of structure.

MAN. See ANTHROPOLOGY; APE; ARCHAEOLOGY; ETHNOLOGY; PRIMATES.

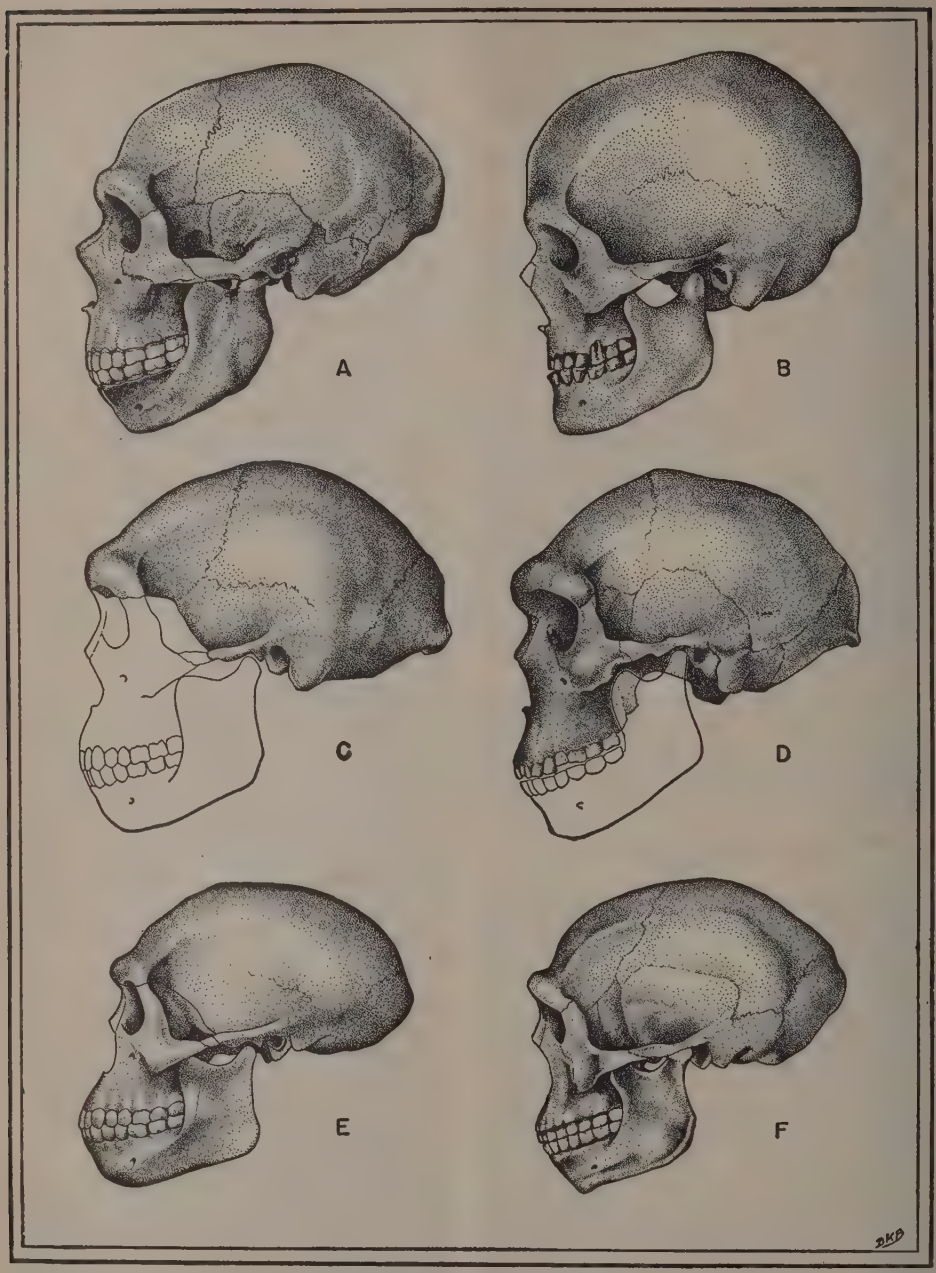
MAN, Prehistoric Races of. The knowledge that there actually were prehistoric races of man, physically different from any of the racial groups living today, dates back scarcely as far as the middle of the 19th century. Prior to that time the dawn of human existence was commonly assumed, even by many scientific men, to have been coincident with the beginning of recorded history, some 6,000 or 7,000 years ago. Even Georges Cuvier, the great French paleontologist of the early 19th century, was intolerant toward the idea that fossil human bones might be found. However, during the second quarter of the 19th century ancient stone weapons were found in Western Europe actually mingled with the bones of extinct beasts of the Diluvial epoch. Shortly thereafter fossilized human bones were similarly found in the floor of a cave, together with bones of elephant, rhinoceros, and other beasts long extinct in Europe. But these human bones, though very ancient, were not unlike those of modern man. They were clearly the remains of ancient examples of *Homo sapiens.* Then in 1856, occurred the epoch-making discovery of Neanderthal man, a low-browed creature clearly human but so unlike any known race of man that it was made the type of a new species, and in 1891 remains of Pithecanthropus, the famous "Ape man of Java," a barely human creature, were unearthed. Beginning with the early years of the present century discoveries in this field have been numerous in many parts of the world. These include, first, fossilized bones of ancient men and of the animals they hunted; second, archaeological relics such as stone and bone implements, which yield information regarding the cultural evolution of prehistoric men; and third, advances in geological knowledge which enable us to measure their antiquity and to know the physical conditions of the various periods in which they lived. No fossil bones of ancient man are known from deposits older than the early phases of the Pleistocene epoch, also called the Glacial or Ice Age; though it is generally admitted that the human and great ape branches diverged from a common stem during Tertiary time.

This is not the place for a discussion of the Pleistocene epoch or Ice Age, or of the disputed chronologies of its several cold and warm phases, but it may be said that estimates of the total duration of the Pleistocene vary from 500,000 years to 1,000,000, with the weight of opinion favoring a median figure. Most authorities recognize in Europe and in North America four periods of lowered temperature with glacial advance, each followed by a warmer interglacial phase. The glaciations are called, beginning with the oldest, the Günz, Mindel, Riss, and Würm, (named after four small rivers in Germany) or simply the 1st, 2d, 3d, and 4th. The second was far the most extensive. The fourth glacial advance is believed to have attained its maximum about 30,000 or 35,000 years ago, so that present time may be considered to be late in the fourth postglacial phase. Geological studies by H. de Terra and others in tropical regions in which no Pleistocene glaciation occurred reveal corresponding pluvial and interpluvial phases.

This article will be devoted chiefly to brief discussions of the various prehistoric types thus far known, stressing their physical features and their inferred relationships. Archaeological evidence will be touched upon only incidentally as it has little bearing on questions of race. A number of discoveries, which for one reason or another do not seem to be important, will be omitted.

It seems best to begin with earlier and more primitive races; then to discuss those which are somewhat more advanced but still below the level of *Homo sapiens,* which will be treated last. The initial discoveries of prehistoric types are usually sporadic and accidental and in many or most cases the material is fragmentary and incomplete. It must be admitted that actual knowledge of phylogenetic relationships and genealogical successions of these ancient human types is extremely meager and tentative, but it is growing steadily as new evidence is brought to light. It is important to realize clearly that these ancient human races were not necessarily limited in their geographic distribution to the particular region where the known fossil specimens were found, and also that the chronological range of such races and species probably comprised tens of thousands of years in every case.

Pithecanthropus of Java.—The most primitive fossil form to be universally accepted as a member of the human family is widely known under the names of "Trinil man" and the "Ape man of Java." In 1891–1892, Dr. Eugène Dubois of Holland unearthed in the dry bed of the Solo River near the village of Trinil in central Java,



SKULLS OF SIX IMPORTANT TYPES

A. Neanderthal man, (*Homo neanderthalensis*), Chapelle-aux-Saints, Corrèze, France. Mainly after Boule.
B. Cro-Magnon man, (*Homo sapiens*), Mentone, French-Italian Mediterranean coast. After Verneau.
C. Solo man, (*Homo soloensis*), Ngandong, Java. Facial bones unknown. Known part after Oppenorth.
D. Rhodesian man, (*Homo rhodesiensis*), Broken Hill, Northern Rhodesia, Africa. Lower jaw unknown. Known part after Woodward.
E. Pithecanthropus, (*P. erectus*), female skull, No. II, Sangiran, Java. Face restored from other specimens. Cranium after von Koenigswald.
F. Peking man, (*Sinanthropus pekinensis*), female skull, restored. After Weidenreich.

a fossilized upper part of a cranium, two molar teeth, and a thigh bone. All these fossils were clearly of higher primate character and Dubois believed them to be parts of a single individual. The cranium was very small, depressed in form with an extremely low, narrow, and retreating forehead with a prominent ridge above the eyes. The cranial capacity is now known to be slightly more than 900 cubic centimeters, which is barely within the minimal limit of normal human cranial volume but far in excess of that of any ape. The form of the brain is also essentially human. Dubois, believing that his Javan discovery represented the realization of a hypothetical missing link which had been postulated in 1868 by Ernst Haeckel and called by him *Pithecanthropus alalus* (speechless ape man), adopted this name for the genus of his Javan find, but substituted the specific name *erectus* in view of the fact that the form of the thigh bone showed that its possessor walked upright. Dubois characterized the creature as a "manlike transition form" and "the precursor of man." The fossils were later brought to Holland where they naturally aroused worldwide interest and evoked spirited discussion. Some authorities held that they belonged to an ape, but a more manlike ape than any hitherto known; others considered them the remains of a lower type of man; while a third group agreed with Dubois that he had discovered a transitional form or missing link. The two molar teeth were shown many years later to belong to an extinct Javan orangutan. As for the femur, though the association with the skull is by no means certain, there are no facts which preclude it. For 45 years the Dubois discoveries comprised the sum total of evidence regarding Pithecanthropus, but from 1936 to 1941 three additional crania and portions of a palate, two lower jaws, and several teeth of this type were found in Java by G. H. R. von Koenigswald. One of these was the fossilized cranium of a child of about two years of age found at Modjokerto, the low forehead of which already shows the beginning of a brow ridge. Further explorations yielded two adult skulls, one of them almost identical in form with the Dubois skull but more nearly complete and somewhat smaller, with a cranial capacity of only 775 cubic centimeters, considerably below any normal human skull. One especially heavy skull was made the type of a new species, *P. robustus,* by Franz Weidenreich in 1945, but there is a possibility that it may be merely a massive male skull of *P. erectus.* H. de Terra, who has made extensive correlation studies of the Asian and Javan Pleistocene, believes that Pithecanthropus had a time range from the first interpluvial phase nearly 500,000 years ago, to the second pluvial (equivalent to the European second glacial) and possibly the second interpluvial. If this is correct, the Pithecanthropus group may have existed for 100,000 years or even longer. Java was at that time, or had been earlier, an extension of the Asian mainland, part of a larger Malay Peninsula, so that Pithecanthropus may be considered essentially a southern Asian form. There is no indubitable evidence as to the culture of these primitive hominidae, but it is known that Peking man, a type only slightly more advanced, fashioned stone implements of a crude sort.

The important question regarding Pithecanthropus is: Does he represent an ancestor of any higher human type or does he exemplify merely the end of an early hominid branch which died out? A few years ago many authorities favored the latter alternative, but the discovery of the closely similar Peking man and the recent finding of the later and considerably more advanced Solo man in Java (both described below) lend probability to the view that Pithecanthropus represents a direct ancestor of higher type.

Javan and South Chinese Giants.—A discovery at Sangiran, Java, reported in 1941 by Dr. von Koenigswald is a fragmentary jaw of gigantic size, far larger than that of any known anthropoid ape or man. The teeth, two premolars and a molar, despite their great size show the fossil to be unquestionably human. Like Pithecanthropus, this giant form lacked a chin. Geologically it is believed to be older than Pithecanthropus. Dr. von Koenigswald named it *Meganthropus paleojavanicus* (great man of ancient Java). Dr. Weidenreich believed it to have been larger than a male gorilla. Another giant form discovered by von Koenigswald is represented solely by three huge molar teeth, one upper and two lower, which were found among many other teeth in a Chinese dispensary in Hong Kong. (The Chinese pharmacopeia includes fossil teeth which are pulverized for medicinal use.) The geological provenience is unknown, but the teeth are almost certainly of middle or early Pleistocene Age. The name *Gigantopithecus* (giant ape) *blacki* was given to this type by von Koenigswald, but Weidenreich, who studied the teeth with great care, was convinced that they belonged to a gigantic man, not an ape, and held that the appropriate generic name would have been *Gigantanthropus* (giant man). He believed that these Javan and South Chinese giants were probably ancestral to Pithecanthropus and later normal-sized men, though he admitted that there is no convincing evidence for this view as the actual material consists of only a jaw fragment of one and three teeth of the other of the giant forms.

Peking Man (*Sinanthropus pekinensis*).—For many years certain paleontologists have recognized evidence indicating that the human and ape branches diverged from a common stem during Tertiary time, probably in Asia. Many genera of fossil anthropoids are known from Miocene and Pleistocene formations in India. In 1927 a well-preserved fossilized hominid molar was found in cave deposits at Choukoutien, 37 miles southwest of Peking. On the sole basis of this tooth the late Dr. Davidson Black proposed a new hominid genus and species which he named *Sinanthropus pekinensis* (Chinese man of Peking). This apparently rash venture in taxonomy was soon vindicated by the discovery (1929–1930) of two nearly complete crania and several jaws and teeth almost as primitive as Pithecanthropus. The Choukoutien remains are found in a series of clefts or fissures in Ordovician limestone which represent the remains of a cave of Middle Pleistocene time which was frequented by these early hominids and also by various animals. Geological and paleontological evidence indicates that these cave deposits are perhaps a little later than the Trinil zone of Java. Their age probably corresponds to the second glacial advance in Europe with an estimated antiquity of some 450,000 years. Professor Black published a splendid series of studies of Peking man but unfortunately he died in 1934. He had a most able successor in Prof. Franz Weidenreich who continued the explora-

tions at Choukoutien and published many masterly reports on the material. In all, five fairly complete skulls had been found up to 1936, together with many jaws and teeth but very little of other skeletal parts. The remains found represent probably not less than 40 individuals. There is convincing evidence that most of these people were killed and the severed heads carried into the cave. All of the skulls had been broken open at the base apparently for the extraction of the brain, giving reason to suspect that Peking man practiced cannibalism. He certainly had mastered the art of making fire, fashioned extremely crude implements of chipped stone, hunted deer and other animals, and utilized lower jaws and pieces of deer antler as tools. Hackberries were carried into the cave and cracked to extract the kernels. The Sinanthropus skulls have a small but variable endocranial capacity; one of them measures only a little over 900 cubic centimeters, or about the same as Pithecanthropus. But others are larger, the largest measuring 1,200 cubic centimeters, thus being well within the normal range for Homo. The extremely depressed vault and similar heavy brow ridge give the skulls a striking resemblance to Neanderthal man, but in one particular they are remarkably like Pithecanthropus: namely, in the fact that the cranium is widest near the level of the ear and becomes narrower higher up in the region where the brain case of Homo is widest. There is no chin prominence and the teeth are definitely primitive. It cannot be asserted positively that Sinanthropus was an ancestor of any later type but, as Professor Black asserted, "its dental characters certainly seem to indicate that Sinanthropus could not have been far removed from the type of hominid from which evolved both the extinct Neanderthal and the modern *Homo sapiens.*" Later researches have fully confirmed this view.

Professor Weidenreich held the opinion, based on certain features of cranium, jaws and teeth, that the Mongoloid branch of recent man is more closely related to Sinanthropus than are the whites or Negroes.

Heidelberg Man (*Homo heidelbergensis*).—A human lower jaw found in 1907 in a sand quarry at Mauer near Heidelberg, Germany, remains the most primitive and the oldest human skeletal relic found in Europe with the somewhat doubtful exception of Piltdown man to be considered later. The jaw was found at a depth of 79 feet below the present surface, at the very bottom of a 50-foot layer of ancient river sand which for years had yielded fossilized bones of many species of Early Pleistocene animals, notably the straight-tusked elephant, the Etruscan rhinoceros, and the lion. There is some difference of opinion as to the exact geological age of these fossils, including the human jaw. They cannot be later than the second interglacial (Mindel-Riss) interval. Alfred F. E. Zeuner (1946) places the age as near 450,000 years, thus making it coeval with Peking man. The Heidelberg jaw is extremely massive, the chin prominence is entirely lacking, and the ascending ramus is broader than in any known human jaw, but, despite absence of chin, all the essential features are definitely human. The form of the dental arch is completely manlike, not at all apelike, and even the chinless front of the jaw is quite different from the corresponding part of an ape. The teeth are rather small for so massive a jaw, and the canines are no longer than in many modern men. Comparing it with the other very early hominid types, we find that some of the jaws of Peking man approximate it rather closely, though the teeth of Peking man are definitely more primitive. The recently discovered jaws and teeth of Pithecanthropus also seem to be less completely human. Prof. Otto Schoetensack of Heidelberg, who described the specimen in 1908 and named it *Homo heidelbergensis,* advanced the view, which has been very generally accepted, that Heidelberg man represents an ancestral pre-Neanderthal type or as H. F. Osborn expresses it, "a Neanderthal in the making." Other paleontologists, considering the Heidelberg type too primitive to be included in the genus Homo, later proposed such generic names as *Paleanthropus* and *Protanthropus,* but the original name given by Schoetensack is almost universally used. No artifacts are definitely associated with Heidelberg man, but certain worked bone implements have been tentatively ascribed to him (Voelcker, 1933). There is surely no reason to believe that he had not advanced culturally as far as Peking man. The famous jaw of 1907 remains the sole relic of Heidelberg man but its importance has been greatly enhanced by the discovery, more than 20 years later, of the probably closely related Peking man and the new material of the Javan Pithecanthropus. These three types, all of rather Early to Middle Pleistocene times, representing the oldest and most primitive universally recognized members of the human family, may well be grouped as protanthropic hominids. Their distribution accords with the view that various prehominid stocks radiated from a region in central or south central Asia, such as northern India where Miocene and Pliocene rocks have yielded many fossil anthropoids. Another form, possibly but doubtfully belonging with these protanthropic men, is represented by two badly fragmented skulls found by L. Kohl-Larsen in 1935 in northern Tanganyika, East Africa. The more nearly complete of these skulls has been restored by H. Weinert (1939) in such fashion as to give it a close resemblance to Pithecanthropus and Sinanthropus. He named it *Africanthropus njarasensis.* The geological incidence is uncertain but it appears to be Late Pleistocene, long after the time range of any of the three protanthropic types discussed above, and the inclusion of the Africanthropus in that group on present evidence does not seem to be unwarranted. The fact that the three somewhat similar protanthropic types (Java, Peking, and Heidelberg) were widely scattered toward the periphery of the great Eurasian land mass early in Pleistocene time (with the Africanthropus in Africa as a very doubtful fourth), all of them in regions later inhabited by more advanced human types, suggests that the differentiation of the human stock into the chief ethnic divisions known today, namely the black, yellow, brown, and white, may have preceded the attainment of the *Homo sapiens* status.

According to this concept recent mankind does not represent the collective progeny of a single primitive *Homo sapiens* stem which secondarily branched into several races as has commonly been assumed, but rather a composite species, a synthesis of three or four primary protanthropic types, none of which persists in pure form today. All modern races show intermingling, some much more than others. This theory of polycentric origin and parallel evolution of the primary races has been

proposed independently by Sir Arthur Keith and Dr. F. Weidenreich. It cannot be said to have been generally accepted by ethnologists.

Neanderthal Man (*Homo neanderthalensis*, Dr. William King, 1864; *Homo primigenius*, L. Wilser, 1897).—This was the first ancient type to gain recognition as a species distinct from *Homo sapiens*. The discovery which led to this identification and on which King's specific name is based was made in 1856. It consisted of the top of a skull and a number of other bones which were dug up in the floor of a limestone cave in a small ravine known as the Neanderthal, near Düsseldorf, Germany. The bones showed a number of unusual features, the skull especially being remarkable for its depressed vault, low, retreating forehead and heavy cornicelike ridge overhanging the orbits. For some years it was variously regarded as the skull of an idiot, as a pathologically deformed specimen, and as belonging to a barbarous and savage race. But it was recognized as a distinct human species in 1864. It is a remarkable fact that a female skull of the same species found in a cave at Gibraltar in 1848, eight years before the Neanderthal discovery, remained practically unknown until 1906 when it was shown to be of the Neanderthal species, of which by that time a number of other remains were known. Neanderthal man is now by far the best known of all types of Pleistocene humanity. His remains, chiefly from limestone caves and rock shelters, are in many cases thoroughly documented by the bones of contemporaneous animals and by associated stone implements of the Acheulean and especially of Mousterian culture which represent his handiwork. Germany, Belgium, France, Croatia, Spain, Italy, and recently Palestine have all yielded skeletal material and Mousterian implements, and the latter are also known in North Africa. A recent discovery of especial importance is a practically complete skull of a Neanderthal child of about eight years, together with other parts of the skeleton and Mousterian tools found in 1939 in a cave in southern Uzbek in central Asia. The particular significance of this find is that it extends the known range of Neanderthal man much farther eastward, and indicates that he was Eurasian rather than merely European. As stated above, Heidelberg man has commonly been considered a pre-Neanderthal form but the much more completely known Peking man is at least as well qualified to be a Neanderthal precursor. The site of the Uzbek discovery in central Asia is geographically almost exactly midway between Peking and Heidelberg.

For many years Neanderthal man was supposed to represent a single type, especially identified with the fourth or Würm glacial epoch and with the Mousterian flint industry. This group, which we may call the typical Neanderthal form, is represented by the original Neanderthal specimen, two skeletons from Spy, Belgium, and the skeletons from Chapelle-aux-Saints, Le Moustier, La Ferrassie and other well-known examples from France and other parts of Western Europe. These typical Neanderthals are all heavily built and of short stature, usually not more than five feet, three or four inches, the females somewhat less. In general, the bones are extremely massive. The skull is of strikingly unique form with a depressed vault, a low, retreating forehead and an especially notable feature is the heavy supraorbital ridge, very similar to that of Peking man. The cranium, however, is usually large, in some cases with a capacity well above the average of modern man, though some female skulls are rather small. The cheek bones slope obliquely backward and the depression in the cheek region known as the canine fossa is lacking. The orbits are round and extremely large. The nose must have been prominent, not flattened, but extremely wide. The mastoid processes are very small. In back view the cranium has a peculiar form which has been described as bunshaped. The lower jaw shows no chin or the merest suggestion of a chin. The teeth are large in general but the canines are not relatively so. A peculiarity of the molars in many cases, especially the lower molars, is an enlargement of the pulp cavity which extends downward into the conjoined roots, a dental form called taurodont (bull-tooth) by Sir Arthur Keith. This condition was also sometimes present in the much earlier Peking man. All in all, the Neanderthal skull is so distinctive in almost every feature that it can be identified at a glance. Several other parts of the skeleton show characteristic features but these are not so striking as those of the skull. Study of the skeleton gives no warrant for describing the Neanderthal people as walking semiupright and as having enormously thick, gorillalike necks and imperfectly opposable thumbs, as some writers have pictured them. The massiveness of the limb bones is marked and the forearm and shinbone are short in comparison with arm and thigh. The hands and feet were almost as in modern man. As regards cultural status, the phase of Paleolithic flint industry known as Mousterian, with its skillfully made axes, scrapers, spearheads, borers, etc., is definitely associated with Neanderthal man. Remains of ancient hearths show that these people possessed the art of making fire, probably an inheritance from protanthropic ancestors, as we know that Peking man was a firemaker, and in a number of cases the dead had been given careful ceremonial burial in caves and rock shelters, together with flint implements and parts of the bodies of animals, evidently intended for the use of the departed. Neanderthal man has usually been identified with the fourth (Würm) European glacial, but a number of skeletal remains of this type are those of earlier people who are known to have lived during the third interglacial epoch. Examples of these are the remains found in the region of Weimar and Ehringsdorf in Germany, the remains from Krapina in Croatia (Yugoslavia) and three skulls recently found in Italy. The earlier age of these remains is indicated by geological conditions and in some cases by associated flint implements of the Acheulean culture phase. Some of these are believed to be probably 75,000 to 100,000 years old. A skull found in 1933 at Steinheim, a few miles north of Stuttgart, Germany, is especially puzzling. It is apparently a female skull obviously Neanderthaloid in general, but it is the smallest known skull of that type and in a number of important features it deviates notably from the Neanderthal cranial pattern and in a few particulars it even approximates *Homo sapiens*. This is the more remarkable in that it is clearly of the Riss-Würm interglacial age and thus very much older than the typical Neanderthals. As some of the cranial and dental features of Neanderthal man are regarded as exhibiting specialization or even degeneration it is possible that the Steinheim specimen may represent an early and more generalized phase in the evolution of that type.

In 1925 a portion of a Neanderthaloid skull was found near the Sea of Galilee in Palestine and, 1932 and shortly thereafter, in a group of three caves at the foot of Mount Carmel, at least 10 skeletons were found, all or most of them representing intentional burials. Careful study of these remains by Theodore McCown and Sir Arthur Keith shows that while some of them are predominantly Neanderthal, others, apparently of the same period, exhibit a remarkable mixture of Neanderthal and *Homo sapiens* characters. This mixture of characters constitutes a perplexing problem. McCown and Keith believe it represented a rapid local evolution of the sapiens type from the Neanderthal, but another suggested explanation is that the Mount Carmel population lived at the boundary where two races, already differentiated in different regions, happened to come in contact; but if that is true, the origin of the higher type is a problem.

Homo Sapiens.—The fate of Neanderthal man is unknown. We know that this race or species survived until some time after the maximum of the fourth or Würm glaciation, but at a time estimated to have been some 25,000 to 30,000 years ago, Neanderthal man seems to have disappeared as a specific type and to have been superseded by *Homo sapiens.* Unfortunately, notwithstanding abundant speculation, scarcely anything is definitely known regarding the ethnic origins of our own species, perhaps less than is known about the origin of Neanderthal man, for in the latter case there are at least the Peking and Heidelberg types which represent possible ancestors. It was long believed very generally that the Neanderthals were exterminated by early examples of *Homo sapiens* who invaded Europe from Asia or possibly northern Africa bringing with them the Aurignacian culture, but there is no evidence of such a superior race inhabiting these countries at so early a period. Besides, we know now that the range of the Neanderthals included central Asia as well as Europe. Even on the theory of invading conquerors there would probably be some racial mixture, and a number of ethnologists are convinced that some of the Europeans of early postglacial time show evidence of Neanderthal inheritance. One early type of *Homo sapiens fossilis,* sometimes cited as exhibiting this, is the so-called Brünn race, named from a late Paleolithic site of discovery in Moravia. These were long-headed people with rather prominent superciliary ridges on the brow, but any special relationship to the Neanderthal man is very questionable. At the present time some competent authorities reject the theory of an invading superior race and hold the opinion that *Homo sapiens* represents a direct evolution from Neanderthal man, but this proposition has not yet been demonstrated. One apparent obstacle to the acceptance of such evolution in Europe is the suddenness of the transition. There are no really well-marked intermediate types. In Europe during the late Paleolithic culture phases several varieties of *Homo sapiens fossilis* existed. One of the older was the so-called Brünn type already mentioned. Another, known from only two skeletons buried in a cave near Monaco and called the Grimaldi race, was believed to be an early negroid type, but it has been shown recently that they probably represent a variant of the Cro-Magnon race. The name Cro-Magnon was first applied to a group of skeletons found in the Dordogne in France in 1868, which were believed to represent a well-defined race of tall people marked by high, capacious cranium, vertical forehead, narrow nose, and prominent chin. With this fine physical type is associated the superior flint implements, carvings, engravings, and cave paintings characteristic of the Solutrean and Magdalenian phases of Late Paleolithic culture. Later studies have demonstrated, however, that the population of Europe in Late Paleolithic showed great variation so that the name Cro-Magnon should probably be used, if at all, in a much more inclusive sense. Prof. E. A. Hooton of Harvard, who has given much attention to the study of Late Paleolithic Europeans, states that he is "so unregenerate as to be sceptical of the reality of the Cro-Magnon race if the term race be used in its proper anthropological connotation." G. M. Morant, on the basis of craniometric studies, concludes that "the Upper Paleolithic type is modern in almost all respects . . . it resembles . . . the modern dolichocephalic races of Western Europe and there can be little doubt that the latter population is directly descended from the earlier."

Rhodesian Man of Africa, Solo Man of Java, and Others.—Two examples of ancient hominids remarkable for their similarity, notwithstanding the fact that they inhabited widely separated regions, are (1) the Rhodesian man (*Homo rhodesiensis*), known only from a single skull and a few bones found in 1921 in northern Rhodesia; and (2) Solo man (*Homo soloensis*), represented by eleven crania and two tibiae discovered between 1931 and 1936 in central Java near the village of Ngandong on the Solo River, only six miles from Trinil where Dubois found the first Pithecanthropus skull 40 years earlier. Until the Solo discoveries, the Rhodesian man seemed utterly unique, isolated, and problematical, but Solo man is so similar in cranial characters that the close relationship of the two types seems beyond question. Of the Solo skulls only the cranial regions were found and all of them had been broken open at the base, apparently for the extraction of the brain, exactly as in the case of Peking man, another example of primitive head hunting or cannibalism. The Rhodesian and Solo skulls show such striking superficial resemblance to Neanderthal man in the low vault, retreating forehead, and heavy brow ridge that some persons consider them to be aberrant African and Javan examples of that type, but the similarities are outweighed by many impressive differences. The apparent likenesses to the Neanderthal men are merely examples of what the zoologists call parallelism. The cranial capacity is low, in most cases well under 1,300 cubic centimeters. The Solo type which de Terra places in third interpluvial (interglacial), possibly 150,000 years ago, has every appearance of being a true descendant of Pithecanthropus, just as the Neanderthals of Europe and Asia probably evolved from the early and more primitive Peking and Heidelberg types. G. H. R. von Koenigswald, who has made careful studies of Solo man, concludes that "we have in *Homo soloensis* the oldest . . . known representative of *Homo sapiens fossilis.*" (The context of this statement indicates that he would include Rhodesian man.) The Solo and Rhodesian men seem to represent an ancient proto-Australoid stage, a sort of transitional form between Pithecanthropus and the later Australian aborigines. Two well-preserved skulls of Late Pleistocene age found in southern Australia lend support to this view. One of these is the Talgai skull from

Queensland, the other the Cohuna skull found in Victoria. These are definitely of the same racial type as the modern Australians but more primitive and apparently closer to the archaic proto-Australoids of the Solo-Rhodesian type. No subhuman primates, living or fossil, are known from Australia, and it is practically certain that man of proto-Australoid type migrated to that continent fairly late in the Pleistocene epoch. Java, the home of Pithecanthropus and Solo man, also produced in Late Pleistocene time a more advanced type discovered by Dubois at Wadjak in 1889 but not described by him until 1921. The type, based on two extremely massive skulls, was named *Homo wadjakensis* and was placed by Dubois as a proto-Australoid type, but G. Pinkley has shown that the supposed Australian relationship is dubious. There is a possibility that the Wadjak man is Neolithic. Africa has yielded during recent years a number of skeletal remains of Late Pleistocene age which clearly belong to *Homo sapiens* but none of these can be definitely related to the Rhodesian man. Several from South Africa (e.g., the Boskop skull) show such striking likeness in head form to the modern African Bushman as to indicate direct descent of the latter from them, but the ancient skulls are very much larger, which suggests that the Bushman has undergone degeneration in size since late Pleistocene time. Other fossil skeletons, chiefly from East Africa, show unquestionable relationship to the true Negroes. Thus the evidence, scattered and fragmentary though it is, indicates that the true African Negro and the Bushman were distinct types of *Homo sapiens* as long ago as Late Pleistocene time.

Several discoveries have been made in England of skulls not complete enough to allow definite species identification, but there is reason to believe that they represent very ancient, perhaps mid-Pleistocene, examples of *Homo sapiens*. The best authenticated, geologically, is the incomplete Swanscombe skull found on the south bank of the Thames in 1935. It almost certainly dates from the second interglacial interval. The top of a cranium found in the Fontéchevade cave in France, the Charente, in 1947, is of importance as it is clearly of third interglacial age. It appears to belong to *Homo sapiens* and resembles the still earlier Swanscombe skull. It affords additional evidence that our own species inhabited western Europe at least as early as Neanderthal man.

Piltdown Man (*Eoanthropus dawsoni*).—Some pieces of a human cranium and a part of a lower jaw found in ancient river gravels at Piltdown in Sussex, England, in 1911–1912, have evoked more controversy and more legitimate difference of opinion than any other discovery relating to early man. The cranial fragments are essentially those of *Homo sapiens*, their most remarkable feature being their unusual thickness, but the lower jaw, consisting of almost the complete right half and containing two molar teeth, is strikingly apelike in the chin region (which has a well-marked "simian shelf" as in the recent manlike apes), and somewhat so in the form of the molars, so apelike, in fact, that had it been found alone, it would undoubtedly have been considered the jaw of a fossil ape. (No fossil apes are known in England but jaws and teeth of large fossil apes, have long been known from Miocene and Pliocene formations in France and Germany.) Sir Arthur Smith Woodward, convinced that the Piltdown jaw belonged with the cranium despite its apelike character, united these fragments to constitute the type of a new genus and species, *Eoanthropus* (dawn man) *dawsoni*. The association of jaw with cranium as a single type received apparent confirmation from a second discovery in 1915, some two miles from Piltdown, in which a lower molar, practically identical with the corresponding tooth in the famous jaw, was found with some cranial fragments very like the original skull. Unfortunately, the geological age of the Piltdown gravels is somewhat uncertain, though competent opinion now places them as Early Pleistocene. Many authorities believe the skull to have belonged to a later period and to have become accidentally mingled, perhaps during a freshet, with older gravels and fossils of various ages. The proponents of the Dawn man theory hold, on the other hands, that the Piltdown cranium is not *Homo sapiens* but a vastly older and perhaps ancestral type, an early hominid in which the brain (about 1,240 cubic centimeters) had developed far in advance of the jaws which had not yet progressed beyond an apelike ancestral condition. It may be said, in general, that the circumstances of the discovery tend to support the validity of Eoanthropus, but the fact remains that the association of the apelike jaw with a cranium essentially of *Homo sapiens* type seems grotesquely incongruous. British authorities tend in the main to accept the authenticity of the Dawn man, while many in Continental Europe and America are skeptical, favoring the theory of fortuitous association. There is much to be said on both sides of the Piltdown question, which is fully presented in some of the works listed in the bibliography following this article.

Prehistoric Man in America.—This subject can be very briefly treated here as it is now generally admitted that all the American aborigines of both North and South America belong racially to the Mongoloid division of *Homo sapiens* and that their ancestors came from northeastern Asia (Siberia) to Alaska in the region of Bering Strait after the maximum of the last Pleistocene glaciation. Some probably came by land during a period when there was a land bridge connecting the two continents; others may have traveled over the ice or even by boats. There were probably many migrations at different times, during a long period, but there is wide divergence of opinion as to just how old the earliest evidences of man in America are. Skeletal remains believed to be of the late glacial or early postglacial age have been reported from Florida, Minnesota, California, and from sites in South America, but they are all of the Amerindian type and the evidence for their great antiquity is not universally accepted. Apparently much older than most of the skeletal discoveries made before 1947 are certain ancient stone points of highly skilled workmanship known as Folsom points since they were first found near Folsom, N. Mex. in 1925. More recently they have been found in other regions of the Southwest, and stone spearheads found mingled with bones of mastodon, elephant, and other long extinct animals show that early Americans hunted these long extinct creatures. The Folsom culture is believed by geologists and physiographers to be at least 10,000 years old and probably considerably older, which places the earliest immigrants from Siberia to Alaska still earlier, perhaps by several

thousand years. In general, the anthropologists seem to be content with less impressive chronologies than are the geologists. In any case it is certain that the Mongoloid branch of *Homo sapiens,* like the white and black divisions, was fully differentiated before the first migrations from Asia to America in Late Pleistocene time.

A discovery of great importance was that of parts of a human skeleton, including a fairly complete skull in the Upper Pleistocene near the village of Tepexpan in Mexico, in 1947. It was found in association with bones of the imperial mammoth, a well-known Pleistocene elephant. The age of Tepexpan man is placed at more than 10,000 years which makes it the oldest human skeleton thus far found in America though many artifacts are believed to be considerably older. The important fact is that this ancient skeleton is very similar to many members of the American type living today.

The So-called "Ape-Men" of South Africa. —Though subhuman primates are outside the scope of this article one fossil group, the recently discovered Australopithecines of South Africa, possess such special interest because of their manlikeness, that it seems appropriate to mention them briefly. In 1925 Professor Raymond A. Dart of Johannesburg described a fossil juvenile skull from Taungs, Bechuanaland, which he named *Australo-pithecus africanus* (southern ape of Africa). It combined apelike and manlike features in a remarkable manner—the teeth especially being almost human. Dart characterized it as "a prehuman stock" and "an extinct link between man and his simian ancestor." A dozen years later Dr. Robert Broom of the Transvaal Museum, Pretoria, discovered and described two other types of somewhat similar "ape-men" as he calls them. He named two genera, *Plesianthropus* (nearly man) and *Paranthropus* (beside man). New discoveries are being made constantly. Unlike the great apes, these creatures were entirely ground living and inhabited or frequented caves. In all of them the dental arches and teeth are much more human than apelike. The inference that they walked erect was confirmed by the discovery in 1947 and 1948 of the essentially human pelves of two genera. There is impressive evidence that they used limb bones of ruminants as clubs to kill baboons and other animals. Their brains, though larger than those of apes of similar body size, were much smaller than any normal human brain. The geological age of some of the Australopithecines is apparently Pliocene, of others early Pleistocene.

Bibliography.—Of general works the following may be especially recommended: Osborn, H. F., *Men of the Old Stone Age,* 3d ed. (New York 1919); Keith, A., *The Antiquity of Man,* 2 vols. (London 1925); id., *New Discoveries Relating to the Antiquity of Man* (London 1931); Hrdlicka, A., *The Skeletal Remains of Early Man,* vol. 83, Smithsonian Miscellaneous Collections (Washington 1931); Howard, E. B., "Evidence of Early Man in America," *The Museum Journal,* vol. 24, nos. 2 and 3 (Philadelphia 1935); MacCurdy, G. G., *Early Man* (Philadelphia 1937); Weinert, H., *Entstehung der Menschenrassen* (Stuttgart 1938); McGregor, J. H., "Human Origins and Early Man," chapter 2 of F. Boas, *General Anthropology* (Boston 1938); Howells, W. W., *Mankind so Far* (Garden City, N. Y., 1944); Hooton, E. A., *Up from the Ape,* 2d ed. (New York 1946); Weidenreich, F., *Apes, Giants and Men* (Chicago 1946); Broom, R. and Schepers, G. W. H., *The South African Fossil Ape-Men, the Australopithecinae* (Pretoria 1946); Boule. M., *Les Hommes Fossiles,* 3d ed. (Paris 1946); Gates, R. R., *Human Ancestry from a Genetical Point of View* (Cambridge, Mass., 1948). Monographs have been published on most of the important discoveries, references to which may be found in the general works named above.

JAMES H. MCGREGOR,
Professor Emeritus of Zoology, Columbia University.

MAN WITHOUT A COUNTRY, The. Few, if any, short stories written with a purpose have achieved that purpose so completely as did *The Man Without a Country,* by Edward Everett Hale. Written during the Civil War, it did much to inculcate patriotism at a critical period in the fortunes of the Union. The story centers about Philip Nolan, a lieutenant in the Army of the United States, who came under the influence of Aaron Burr, foreswore his country, and as a punishment was condemned never again to hear its name. To effect this, he is kept prisoner all through his long life, first on one ship, then on another, until at last he dies during the Civil War. Though the idea of lifelong imprisonment on shipboard is in itself novel and striking, and the naval setting is worked out with remarkable attention to detail, the chief interest of the story lies in the development of the character of the hero, who, from hating his country, grows through suffering to love her with passionate devotion. All this is told so convincingly, with such a mingling of fact and fancy and with such a wealth of contemporary allusions, that thousands of readers believed it to be an account of fact. The germ of the plot was suggested to the author through the reading of Scott's *Life of Napoleon.* It occurred to him that if Napoleon had been passed from ship to ship instead of being confined on Saint Helena, England would have been spared much contumely and the French would not have turned Saint Helena into a shrine. The "local color," which adds so much to the story, was gained from reading the records of the navy and the proceedings in the trial of Aaron Burr. Immediately upon its publication in the *Atlantic Monthly* of December 1863, *The Man Without a Country* became famous, was copied everywhere and was soon translated into foreign languages.

MAN-OF-THE-EARTH, a local name in the Southern States for *Ipomoea pandurata,* the wild sweet potato vine. A hardy perennial, it is sometimes used for clothing stumps, fences, etc. Generally, however, it is a pernicious weed. The name is also applied to the wild cucumber, *Enchinocystis lobata.* See also IPOMOEA; MORNING GLORY.

MAN-EATER, a term applied to any fierce animal which has acquired, or is believed to have acquired, a habit of killing human beings as food. Lions, tigers, leopards and other great cats are accused of it, and undoubtedly many of these beasts, finding how easily a man or woman among East Indian or African villagers may be struck down or seized when sleeping in a flimsy hut, make their lairs near settlements and for a time regularly subsist upon human victims. Such are sometimes, but not always, old cattle-thieves, whose teeth are worn, and which feel unable or unwilling to undertake the exertion of tracking and pulling down wild animals; but this is not always the case. When

such a beast has taken his residence in a district no pains must be spared to kill him, for he will not cease his depredations. Horses, elephants, camels, etc., sometimes become man-eaters in effect, understanding and exercising their power over him for harm.

A man-eater shark is the great white or blue shark (*Carcharodon carcharias*), which is one of the largest and most formidable of fishes. See also SHARKS.

MAN AND NATURE, a work of great research written in 1864 by George Perkins Marsh (q.v.). Its full title was *Man and Nature, or Physical Geography as Modified by Human Action.* The work became at once a standard with international recognition; a considerably enlarged Italian edition was issued at Florence in 1870; and a second American edition, with further changes, appeared in 1874.

MAN AND SUPERMAN, a play by George Bernard Shaw, subtitled "A Comedy and a Philosophy," and published in 1904. A comedy in the sense that it has an ironically happy ending, and a philosophy in the sense that it contains typical Shavian intellectuality, *Man and Superman* is a play primarily to be read. The play is patterned after the English comedy of manners. John Tanner, a radical political pamphleteer with a deep distrust of women, and Roebuck Ramsden, an extremely respectable gentleman, are appointed joint guardians of a flirtatious young woman, Ann Whitefield. Octavius Robinson, the ward of Ann's lately deceased father, is Tanner's best friend and is in love with Ann. Humorous complications are created by the secret marriage of Octavius' sister, Violet, to a wealthy American whose father desires that he marry a titled Englishwoman who owns an abbey. After several romantic escapades that transport the characters to the Spanish mountains where they become involved with an ethical highwayman, and which include a dream sequence dealing with the original characters from Mozart's Don Giovanni, the play concludes, once more in drawing-room comedy fashion, with Tanner marrying Ann and the triangles being neatly squared. The plot outline is similar to the fashionable comedy popularized by Oscar Wilde with its romantic involvements and a wealth of epigram and caustic wit. Using this old form as a vehicle for his brilliant, iconoclastic social criticism, Shaw accomplishes the double effect of satirizing both the form he uses and the ideas conventionally held in that period. Not satisfied to confine himself to his expressed theme of the battle between men and women in modern society, Shaw includes his philosophy of politics, metaphysics, and morality.

MAN IN THE IRON MASK, The, a mysterious prisoner confined in several French prisons in the time of Louis XIV. He died in the Bastille, Nov. 19, 1703, and was buried the following day in the cemtery of St. Paul's Church under the name of Marchioli. Actually his mask was of black velvet, not of iron. The mystery of his identity was discussed by many writers of the 18th and 19th centuries, notably by Voltaire in his *Siècle de Louis XIV*. Among the persons identified as the masked prisoner were Fouquet; the duke of Monmouth, an illegitimate son of Charles II of England; an illegitimate brother of Louis XIV; a twin brother of Louis XIV; General de Bulonde; and a soldier of fortune of Lorraine named Marechiel. The most widely accepted theory is that he was Count Antonio Mattioli, called in French texts Martioli. As secretary of state to the duke of Mantua, Mattioli betrayed both his master and Louis XIV. Having accepted the French king's bribe to persuade the duke to deliver the fortress of Casale to the French, Mattioli revealed the plan to other interested rulers. His treachery discovered, he was trapped by French agents on Venetian territory, April 23, 1679, kidnapped into France and confined in the fortress of Pignerol of which Saint-Mars was governor. Saint-Mars, receiving the governorship of other fortesses and finally of the Bastille (1695), retained personal charge of his masked prisoner. Baron d'Heiss in a letter to the *Journal Encyclopédique* of June 28, 1770, was the first to identify the masked prisoner as Mattioli. The literature concerning the Man in the Iron Mask is extensive including 52 works published prior to 1870 and more than 20 thereafter. Consult Funck-Brentano, "L'Homme au masque de velours noir dit le masque de fer," *Revue Historique,* vol. lvi (Paris 1894); Hopkins, *The Man in the Iron Mask* (London 1901).

MAN-O'-WAR, great American race horse, foaled in 1917, having in his veins the blood of all three great English sires: Matchem, Herod, and Eclipse. On June 12, 1920, he ran 1⅜ mile in 2 minutes, 14⅕ seconds, at Belmont Park, N. Y. On Sept. 4 of the same year, he ran 1⅝ mile in 2 minutes, 40⅘ seconds. He placed first in 20 of the 21 races in which he was entered. See HORSE—*American Racing.*

MAN OF BLOOD AND IRON, The, the name given to Bismarck. See BLOOD AND IRON.

MAN OF DESTINY, The, a name given to Napoleon Bonaparte, who considered himself specially chosen and directed by fate.

MAN-OF-WAR, an armed naval vessel regularly employed in the service of a government for war purposes.

MAN-OF-WAR HAWK, or **FRIGATE BIRD,** a tropical web-footed bird (*Fregata aquila*), of the family *Pelecanidae.* The color of the adult bird is shining black, glossed with green, the female being duller in hue. Including the long tail the male bird reaches three feet in length, but the body is extremly small. The bill is longer than the head, strong, hooked at the point and sharp. In proportion to their size their wings are longer than in any other bird and have an extent of seven feet or more. Their flight is so powerful that they are seen more than a thousand miles from shore. They move with great difficulty on land, and rarely alight on the water. Possessing great strength and superior power of wing, the frigate bird pursues terns or gulls which have secured a fish, and by beating them with wings and beak forces them to drop or disgorge it; then seizes the prey before it reaches the water. It also catches flying fish for itself. Its usual locality for breeding is the summit of some rocky cliff, but breeds among trees where there are no rocky shores, making a rough platform of sticks. There is only one chalky white egg. This species is found throughout the tropics

and a second species (*F. minor*) ranges about the Indian and South Pacific oceans.

MANACLE ROCKS, England, dangerous reefs on the south coast of Cornwall, 7½ miles south of Falmouth. They are barely visible except at low water, and the only warning of their presence is a bell buoy. Many wrecks have occurred here.

MANADO, mä-nä′dō, or **MENADO,** mä-nä′dō, seaport in the United States of Indonesia, near the northeastern tip of the northern peninsula of Sulawesi (Celebes) Island, 600 miles northeast of Macassar. It is the capital of the residency of the same name, having an area of 34,191 square miles and a population (1930) of 1,138,655. The town lies at the foot of Mt. Klabat on an inlet of Celebes Sea, on the route from Hong Kong and the Philippines to Australia. It is the chief port of northern Celebes exporting copra, coffee, sugar cane, and ebony. Manado has also an airport and is an agricultural trade center; there is a large Chinese population. The climate is extremely hot and humid. A settlement was first established here by the Dutch in 1657. In January 1942 it was taken by the Japanese, who held it until 1945.

MANAGER, City. See CITY MANAGER PLAN OF GOVERNMENT.

MANAGUA, mä-nä′gwä, the capital of Nicaragua, on the south shore of the Lake of Managua, 45 miles southeast of Leon. It is also the capital of the department of the same name, which has an area of 1,330 square miles and a population (1950) of 162,455. The city is the political, commercial, and manufacturing center of the nation and lies on the Pan-American highway and on the railroad from Granada to Corinth on the Pacific. Puerto Somoza is being rapidly developed as its Pacific port. Managua, which has a very hot climate, is built on a regular, modern plan. The government and business buildings and most homes are modern, having been rebuilt after the earthquake and subsequent fire which in 1931 practically destroyed the city, taking 2,500 lives. There is a fine central park, a national museum, a library, a capitol, and a new cathedral being completed. The university was transferred to Leon. Residential sections have spread to the hills to escape the heat. Managua was a large Indian village at the time of the Spanish conquest, but led an obscure life until 1855, when it became the national capital as a compromise between the rivalling cities of Granada and Leon; then it expanded rapidly. U.S. Marines were stationed in Managua almost continuously from 1912 to 1933 to maintain order in the country. Pop. (1950) 107,444.

MANAGUA, Lake, second largest in Nicaragua, it lies about 15 miles northwest of Lake Nicaragua, at an altitude of 120 feet. It is 38 miles long and reaches a maximum width of 16 miles and a maximum depth of 65 feet. It is fed by several small streams and drains into Lake Nicaragua through the small Tipitapa River. The city of Managua lies on its southern shore. Fishing and hunting alligators, whose skins are sent to New York, are the chief occupations. A canal crossing Nicaragua through the lake was under consideration early in the 20th century, but preference was then given to the Panama Canal project.

MANAKINS, a rather undefined group of South American tropical birds, mostly of the family Pipridae, related to the North American tyrant flycatchers. They are small, brightly colored, and the wings often bear curiously modified and often highly ornamental feathers.

MANAMA, mä-nä′mä, capital of the Bahrein Islands in the Persian Gulf off the Arabian coast, on the northeastern shore of the island of Bahrein. It is connected with the island of Muharraq by a modern swing bridge. Manama is headquarters of the pearl-fishing industry of the Persian Gulf and is the seat of the local sheikh and of the British Persian Gulf Presidency. It was greatly developed after oil was discovered in the islands in 1932 and has an oil refinery. With the royalties, sanitary and educational conditions were greatly improved. Pop. (1950) 39,648.

MANAOAG, mä-nä′wäg, town and municipality in the Philippines, in the province of Pangasinan, in central Luzon, 17 miles east of Lingayen. Sugar cane, rice, and copra are cultivated. Pop. of the municipality (1948) 34,304.

MANASAROWAR, măn′ä-sä-rō′ĕr, Tibet, a sacred lake and pilgrimage resort north of the main Himalayan range, near Darchan, between the sources of the Brahmaputra and the Indus. It lies at an altitude of 15,000 feet, is almost circular in form and about 15 miles in diameter.

MANASSAS, mä-năs′ăs, town of Virginia, the seat of Prince William County, 25 miles west of Alexandria, on the Southern Railway; altitude 317 feet. It is a rail junction, road center, and agricultural market. The government is of the mayor-councilmanic type. The creek called Bull Run and the Manassas National Battlefield Park, covering the battlefields of Bull Run, are near by. The courthouse has a collection of war relics. Manassas was incorporated in 1873; rechartered in 1938. Pop. (1950) 1,804.

MANASSAS, First and Second Battles of. See BULL RUN.

MANASSAS GAP, Engagement of, was fought July 23, 1863, during the retreat after Gettysburg of Lee's Confederate army, pursued by Union troops under Meade. The Confederates had Wright's brigade deployed at the west end of the Gap and Rodes' division about 600 yards in the rear under orders to hold the gap. At 4 P.M. the Union attacked: Spinola's brigade and Ward's two regiments engaged Wright's men and drove them back upon Rodes, who stood firm, the artillery checking the Union advance. Wright's loss was 19 killed, 83 wounded, and 66 missing; the Union lost 21 killed and 84 wounded. Next morning the Union advance marched to Front Royal, but all of Lee's army had passed.

MANASSEH, mä-năs′ĕ, the older but less important of the two sons of Joseph, whose name is derived from the word "to forget" and explained as signifying "he who causes one to

forget" that is "all my toil" (Genesis 12:51). Although in Jacob's blessing he was made subordinate to his younger brother Ephraim (Genesis 48:14), he was to be protected by the redeeming angel and to become the ancestor of a great people (Genesis 48:16, 19). The next verse "in thee shall Israel bless, saying God make thee as Ephraim and Manasseh" forms the benediction which Jewish parents utter over their sons on the eves of Sabbath and holydays. The name is held by one of the tribes of Israel, the sixth in numerical strength (Numbers 26:34), to which a position was allotted in the land of Canaan. During the journey through the desert of Sinai, its station was with Ephraim and Benjamin west of the Tabernacle and it took a prominent part in the battle. Israel's chiefs Gideon and Jephthah belonged to the Manasseh tribe. In time the tribe fell behind Ephraim in prominence and carried assimilation so far, practicing foreign idolatries, that it lost its identity completely.

MANASSEH, king of Judah; d. 639? B.C. The son of Hezekiah, he succeeded his father when he was about 12 years old (2 Kings xxi, 1), had longest reign in the history of Judah (692?–639? B.C.). In the Assyrian inscriptions Manasseh is mentioned as a vassal king during the reigns of Esarhaddon and Assurbanipal. It is also stated (2 Chron. 33:11) that the Assyrian captains took him in chains to Babylon as punishment for Judah's disloyalty to God. On his repentance, however, he regained his throne and showed a genuine religious spirit which gave a new character to his nation. Ezekiel, in a memorable chapter (8), describes the spread of religion during Manasseh's reign and how the popular worship was a shameless blend of foreign idolatries, against which the prophets declaimed but the influence of which was not quickly overcome. A prayer in Greek attributed to Manasseh, composed when captive in Babylon, is found in the Apocrypha, but has never been recognized as canonical by the church.

MANASSEH, son of Johanan, the high priest and brother of Jaddua, who married Sanballat's daughter. In Nehemiah (21:28) he is referred to without name, and he is further declared to have been deposed from the priesthood on account of being Sanballat's son-in-law. In Josephus (Antiq. xi, 8, 2-4), a fuller account is given. Incensed at Manasseh's marriage with a foreign woman, his brother Jaddua, the high priest, placed before him the alternative of divorcing his wife or giving up the priesthood. When he went to Sanballat and frankly declared his preference for the priesthood, despite his love for his wife, his father-in-law assured him that the king would give him the rank of high priest if he would retain his wife. Hence he remained with his father-in-law, and became high priest in the Samaritan temple on Gerizim. A conflicting passage in Josephus (Antiq. xii, 4, 1) mentions Manasseh as high priest at Jerusalem between the priesthood of his nephew Eleazar and that of Onias II.

MANASSEH BEN ISRAEL, bĕn ĭz'rā-ĕl, or **MENASSEH BEN ISRAEL,** Hebrew scholar: b. La Rochelle, France, 1604; d. Middleburg, Netherlands, Nov. 26, 1657. At the time of his birth his parents were living in France after fleeing the persecutions in Lisbon. Soon after they settled in Amsterdam, where Manasseh was educated. In 1620 he was appointed rabbi and soon became a noted preacher. He started the first Hebrew press in Holland in 1627, published a Hebrew grammar and an edition of the Mishnah. The first volume in Spanish of his *El Concilia dor* appeared in 1632; in it he attempted to conciliate apparently discordant passages of the Old Testament. It brought him great fame among the learned of his time and he corresponded with Grotius, Vossius, and others. In his *Esperan ça de Israel,* translated into English in 1650, he sought the readmission of Jews to England and went to London to plead his cause with Cromwell; although accepted with favor, his project was not approved by Parliament. Among his other writings in Latin, Spanish, and Portuguese, are *Vindiciae Judaeorum,* a defense of the Jews, by some considered his greatest work. He was the teacher of Spinoza and a friend of Rembrandt, who painted his portrait.

MANATEE, an aquatic mammal or "sea-cow" of the order Sirenia (q.v., for general structure), several species of which inhabit the fresh waters along the eastern coasts of tropical America and of western Africa. The body is somewhat seal-like in shape, reaches a length of 8 or 10 feet, has a large round head with bristly, tumid lips, no apparent neck, no external ears, the forelimbs converted into paddles, no hind limbs, and the tail spade-shaped, like that of a beaver. The thick wrinkled skin is blackish, and almost hairless, but a coat of short, seal-like fur clothes the foetus, indicating descent from furry ancestors. Structurally the manatee differs from other sirenians in having only six cervical vertebrae, and in the large number of molar teeth, which apparently go on increasing indefinitely during the animal's life—the suggestion being, as Beddard points out, that they are worn away by the attrition resulting from so much sand being mixed with the daily food. The manatees are stupid, gentle, and defenseless creatures, showing great affection for their young, one or two in number, which are nursed at pectoral udders. They never come ashore, but secrete themselves amid aquatic vegetation. Their food consists of fresh-water weeds and their roots, and these are procured by means of the curious form of the upper lip: "this is split in two, and the two halves, which are furnished with strong bristles, can play upon each other like the points of a pair of forceps." This cleft lip is only suggested in the case of the dugong.

The American manatees have been nearly exterminated. They formerly abounded in the Indian River and other marshy waters about southern Florida, but by the end of the 19th century had been reduced to a small, carefully protected band near Biscayne Bay in the Miami River. They still survive in small numbers along the coast of the Caribbean Sea and about the mouths of the Orinoco. The Florida manatee is called by American zoologists *Manatus latirostris,* and is regarded as different from those of Central and South America, long known as *M. americanus.* The African species is *M. senegalensis.*

MANATEE, Florida. See BRADENTON, Florida.

MANAUS, mà-nous, or **MANAOS,** city of northwestern Brazil, the capital of Amazonas state, on a height over the left bank of the Rio Negro, about 10 miles above its junction with the Amazon River. Although it is located almost 1,000 miles inland from the Atlantic by river, ocean-going vessels can reach its busy harbor, built in 1902; because of the marked changes in the water level floating wharves were constructed. Manaus is the trade and distribution center for the whole upper Amazon region; rubber, cacao, Brazil nuts, tonka beans, horns and hides, hardwoods, and dried fish are exported. There is a regular air service with Belém and Rio de Janeiro. The city is completely surrounded by tropical forests and has a very hot and humid climate. It is well built, with broad streets, electricity, a good water supply, and several modern government buildings; a large cathedral rises in the center of the town, which has been an episcopal see since 1892. Manaus is also a cultural and educational center, with high schools, an industrial school, a chemical institute, an historic-ethnographic museum. The botanical and zoological gardens are famous. Manaus was founded in 1660 by Francisco da Motta Falção as São José do Rio Negro; the name was changed to Manaos after 1825 and Manaus after 1939. It was the capital of Rio Negro province before it became in 1850 the capital of the newly-created state of Amazonas. At the end of the 19th century and at the beginning of the 20th Manaus had a period of incredible prosperity due to the wild rubber boom. The golden-domed opera house, now in disuse, the ornate buildings, and the harbor were then constructed. When the rubber trade practically ceased, the city suffered decline; but following World War II trade began to revive. Pop. (1950) 110,678.

MANBY, George William, English inventor: b. Denver, Norfolk, Nov. 28, 1765; d. Southtown, Great Yarmouth, Nov. 18, 1854. He was educated at the military college of Woolwich, and became in 1803 barrack master at Great Yarmouth. His attention having been drawn to calamities resulting in cases of shipwreck, from the difficulty of establishing communication with the shore, he attempted casting a rope from the shore to the wreck by the agency of gunpowder. Chains were unable to stand the shock of the discharge, but stout strips of rawhide closely platted together were found to answer, and on Feb. 12, 1808 the entire crew of the brig *Elizabeth,* wrecked within 150 yards of the beach, were rescued by the simple contrivance of Captain Manby.

In 1810 his invention was brought before a committee of the House of Commons, and having been favorably reported on, he received a grant of money, and all the dangerous stations on the British coasts were supplied with his apparatus. He also contrived shells filled with luminous matter, to enable the crew to perceive the approach of the rope, in the manufacture of which he suggested several improvements.

MANCHESTER, town, Connecticut, in Hartford County; altitude 140 feet; on the New York, New Haven and Hartford Railroad; 8 miles east of Hartford. The township (which includes South Manchester) is situated in a fertile area growing fruits, vegetables, tobacco and nursery products. The Cheney silk mills, established here in 1838, form the town's chief industry. Other manufactures include woolens (made here before 1790), soap, paper and fiber board, parachutes, electrical instruments, needles, clothing, baseballs, toys, leather novelties, machinery and tools, and chimes. Manchester has the Whiton Memorial Library, and South Manchester, the Mary Cheney Library. There is a state trade school here.

Settled in 1672, it was a part of Hartford, and then of East Hartford, until its incorporation in 1823. Town government is operated under a special legislative charter. Pop. (1940) 23,799; (1950) 34,116.

MANCHESTER, măn'chĕs-tẽr; -chĭs-tẽr, county borough and city, England, in Lancashire County, 188 miles north of London and 30 miles east of Liverpool, on the Irwell River, an affluent of the Mersey, and since 1894 connected with the sea at Eastham, on the Mersey, by the Manchester Ship Canal. It is one of the principal manufacturing cities of the world, and the cotton center of Great Britain. Railways (steam and electric) and motor omnibuses communicate with the surrounding towns and villages.

Geography.—The city lies in the southeast corner of Lancashire, bordered by the low Penine Hills on the north and east, and entering the fertile Cheshire plain on the south. The city center is 133 feet above sea level.

Climate.—The climate is temperate; the prevailing wind is southwest. The city, with 30 inches rainfall, is damp rather than wet, with fogs and mists in winter and with sunshine reduced by the industrial smoke pall. This damp climate and ample water supply contributed to the establishment of the cotton industry.

Geology.—Thick deposits of glacial drift, sands, gravels and boulder clay overlie heavily faulted Triassic, Permian and Carboniferous rocks which often reach the surface. The "Pendleton fault" gives rise to occasional earth tremors. Wells in the Triassic rock form a source of industrial water. Coal is mined at two pits within the city and extensively throughout the surrounding area. To the south, vast salt beds feed the local chemical industries, and other mineral deposits abound.

HISTORY

Ancient.—The Romans established a fort at Mancenion in 79 A.D. to guard a military road: a small portion of the wall and Roman objects from the site are still extant. The Romans left Mancenion in 426 and though the place is occasionally mentioned in surveys, little is known until 870, when the Danes destroyed the town. In 920 it was rebuilt by Edward the Elder: in 1028 King Canute gave Manchester the right to coin money. Manchester is briefly mentioned in the Domesday survey of 1086 as poor and sparsely populated.

Medieval.—Manchester's importance dates from the 13th century. In 1229 Henry III granted an annual fair and in 1330 the first signs of industrial activity were seen in the settlement of immigrant Flemish manufacturers. About 1500, vegetable cotton, known as "cotton wool," was introduced. The antiquary John Leland, appointed by Henry VIII, described Manchester in his 1536 survey as "the fairest, best builded, quikkest and most populous towne in all Lancashire." From 1645 Manchester was represented by a member of Parliament. In 1650, Manchester manufac-

tures were given as "woollens, frizes, fustians, sack-cloths, mingled stuffs, inkles, topes and prints" and in 1690 the art of calico printing was introduced from France.

Recent.—In 1717 Manchester's population was 8,000. In the following 200 years, the coming of the Industrial Revolution brought the greatest growth, for by 1900 the population was 543,872. The discovery and exploitation of steam power, and the opening up of road and river communications, paralleled a multitude of mechanical inventions for cotton manufacture. In 1761, the first of a network of canals was built; in 1785 the culminating invention of the power loom for weaving was made, and about the same time the first steam engine was used in cotton manufacture in Miller Street, Manchester. In 1821, the *Manchester Guardian* newspaper was established; in 1830 the Manchester and Liverpool Railway was opened: by 1850 there was a direct rail link with London.

In 1832 Manchester became a Parliamentary borough with two members. Social progress was interrupted in the 1830's and 1840's by food shortage, and despite the repeal of the Corn Laws, great distress was caused in the 1860's by restriction of cotton imports due to the American Civil War. In 1851 Owens College (later the Manchester University) was opened, and in 1894 the Manchester Ship Canal, making Manchester an inland port for ships up to 15,000 tons, was completed. In 1929 land was acquired for a 4,000 acre satellite town at Wythenshawe, and in the following year the first air service from Manchester to the European continent was inaugurated. During World War II, more than 600 Manchester citizens lost their lives in heavy air raids, many of the town's buildings were destroyed, and 30,000 houses were damaged.

Municipal.—In 1301 the lord of the manor granted a charter appointing officers, making rules for town management and defining the functions of the courts, but in practice the lord of the manor remained all-powerful until the latter half of the 18th century when Parliament set up town commissioners. Successful administration was not achieved, however, until 1838, when Manchester was granted, under an Act of 1838, a charter of incorporation giving it an elected municipal council with wide powers of local government. In 1838, the acreage was 4,293; in 1900 the acreage, by absorption of neighboring authorities, was 13,000, and in 1931 the present acreage of 27,255 was attained. Manchester became a city in 1853.

CONTEMPORARY MANCHESTER

Industry and Commerce.—Manchester is the metropolis of southeast Lancashire—one of the principal industrial areas of the world—housing within the city boundary many great industrial plants and, even more significantly, providing packing, marketing, selling, banking, insurance, stockbroking, exchange, and other services for the whole region. Two misconceptions arise from Manchester's reputation as the home of cotton manufacture—that this manufacture is carried out within the city boundary, and that it is the sole important local industry. In fact, cotton manufacture within the city is negligible. The spinning, bleaching, weaving, dyeing, printing, and finishing processes are carried on in the surrounding towns, and the research, marketing, and other commercial facilities are provided in Manchester. Moreover, although cotton manufacture is still the principal local industry, the heavy engineering and chemical industries are now almost equally important, and the volume of production in the city is considerable. Other major products include rubber and leather, wires, ropes, aircraft, storage batteries, clothing, asbestos, belting and chains, and light industrial goods. Much research is carried on by individual firms and a degree of coordination is achieved through the Manchester Joint Research Council, comprising members of the Manchester Chamber of Commerce and Manchester University, and formed in 1944 to bring together science and industry, disseminate new knowledge, encourage research, and inquire into industrial, scientific, economic and sociological problems. Research into cotton problems is performed by the Shirley Institute at Didsbury.

Manchester is an important financial center, with a branch of the Bank of England and with a bankers' clearing house. The Stock Exchange has 120 members. The Royal Exchange is primarily a cotton exchange, but its 4,000 (in 1951) members deal in all classes of goods. Other exchanges deal in coal, food and produce, and real property.

Manchester is a newspaper publishing center comparable with London, publishing three morning, two evening, five weekly, and two Sunday newspapers. Northern editions of five national papers are also printed and published in Manchester.

Transport.—Manchester is linked with the sea by the 35 mile Manchester Ship Canal, with surrounding towns by a comprehensive network of railways and roads, and with other regions by barge-carrying canals. There are four principal railway stations, many smaller stations and extensive sidings. Municipal airports provide facilities for transcontinental aircraft at Ringway, and for private flying and air-taxi work at Barton upon Humber.

Central Government.—*Administration.*—Manchester is a center of national government, housing the regional offices of 16 ministries and local offices of 41 other government departments. Ten members represent the city in Parliament.

Local Government.—The elected Manchester City Council of 144 members (36 aldermen and 108 councillors), has 40 committees, most of whose proceedings require ratification by the City Council. The chairman of the Council and "first citizen" is styled "lord mayor." Manchester's municipal services resemble those of other county boroughs, it is not necessary to enumerate them all. Outstanding examples are the water supply, drawn by pipeline from lakes Thirlmere and Haweswater, nearly 100 miles distant, and supplied to a population of 1,140,000; the municipal gas, electricity and transport undertakings, serving the city and surrounding districts; the city markets, drawing food from and distributing it to a wide area; the municipal airports, of which Manchester had in 1929 the first in the world; the support of the Manchester Ship Canal enterprise, in which the Corporation holds £6,750,000 share capital and appoints 11 directors out of 21; and the Wythenshawe Estate, a satellite town projected in 1926 and since visited by sociologists and planners from all parts of the world. Built on "neighborhood unit" principles, with segregated industrial, residential and agricultural areas, Wythenshawe when complete will

house 60,000 people in the true community of interest which towns of the past have lacked. The municipality is also responsible for the Henry Watson Music Library, the Rutherston Loan Scheme, and the Cunnington Costume Collection, more fully described hereafter.

The Courts.—Manchester has a Court of Assize and a District Registry of the High Court of Justice, and seven other courts of law sit within the city boundary. The lord mayor is ex-officio the chief magistrate; there are 136 magistrates on the roll for service on the bench at the magistrates' courts.

Religion.—The Manchester Cathedral (the Parish Church) is the local nucleus of the Established (Protestant Episcopal) Church (The Church of England), and in the city there are 106 parish and district churches. Manchester has also been a notable home of nonconformity, since the Act of Uniformity in 1662 resulted in the expulsion in Lancashire alone of over 100 ministers of the Established Church who would not subscribe to the Anglican Prayer Book. The first dissenting meetinghouse, Cross Street Chapel (now Unitarian) was built in 1693, and meetinghouses were also built by the Friends (1732), the Wesleyans (now Methodists) (1752) and the Independents (now Congregationalists) (1761). There are 19 Free Church denominations in the city, many of which are represented on an active Free Church Federal Council, and on the Manchester Council of Churches. Manchester's importance as a religious center is emphasized by the presence of seven theological colleges—Baptist, Methodist, Congregational, Talmud Torah, Moravian, Unitarian, and Roman Catholic. Connected with these are many religious societies whose work is closely interwoven with that of the local voluntary bodies, and who maintain 120 day schools in conjunction with the Municipal Education Committee. At nearby Fairfield is a Moravian settlement, more fully described hereafter.

Medicine.—Manchester, a center of medical research and treatment, has twenty-one voluntary (privately supported) and twelve municipal hospitals, served by a distinguished group of specialist doctors and surgeons. The Royal Infirmary (with the Manchester University medical school the nucleus of medicine in the city) provides 875 beds, and the Christie Cancer Hospital and Holt Radium Institute is the foremost center of cancer research and treatment in the British Commonwealth.

Education and Culture.—The Victoria University of Manchester is the hub of the Northern British universities group. The university bears a fine reputation and has led the world in research into atomic structure: in the university laboratories, professors Ernest Rutherford, James Chadwick, John Douglas Cockcroft, and (William) Lawrence Bragg first watched the atom disintegrate, discovered the neutron and first mechanically disintegrated the atom. Research continues. The university is closely connected with the municipal College of Technology, where technical degrees are taken. At the Manchester Grammar School, founded in 1515 by Hugh Oldham, Bishop of Exeter, many distinguished British statesmen and citizens began their education. The city's schools include a number of religious training colleges, a college of music, and, under the municipality, an art school, domestic economy college, schools of commerce, adult education centers and several hundred day schools.

The Municipal Art Galleries house a fine collection of works of the English school of the last century and of the Pre-Raphaelite Brotherhood, with many specimens of the work of 18th and 19th century painters and contemporary artists, and foreign works. Special collections include statuary, furniture, silver, glass, enamels and ceramics. Under the Rutherston Loan Scheme, Manchester's art treasures are loaned to other British towns.

Platt Hall (municipal) the first museum in Britain devoted exclusively to costume, exhibits the collection of English women's costumes formed by Dr. C. Willett Cunnington. Acquired for Manchester by public subscription, the collection of dresses and dress accessories, books, periodicals, and fashion plates covers a period of two hundred years.

The Whitworth (private) Art Gallery contains an important collection of English water colors and textile fabrics from the 1st century onwards. The Manchester Museum of the University possesses one of the most comprehensive collections of Egyptian antiquities in Britain, in addition to collections of fossils, plants, animals, and arts and crafts.

The municipal libraries comprise a central library and 36 branch libraries. The Manchester Central Library houses the finest municipal reference collection in the country, a technical and patents library, a commercial library, and the Henry Watson Music Library. The last is acknowledged the finest and largest music collection for public borrowing in the world, with 73,549 volumes and 309,474 pieces of sheet music available for borrowing, and with many rare books, manuscripts and instruments. A former baronial hall, c.1425, houses the Chetham Library and Bluecoat School for poor boys, founded by Humphrey Chetham in 1653. The library, the earliest free library in Europe, is essentially a scholars' library with its 100,000 volumes of classical, historical, topographical, philosophical, theological, archaeological, and antiquarian works.

The John Rylands Library (for reference and research), a center of attraction for scholars and lovers of rare and beautiful books from all parts of the world, includes the Spencer Althorp Collection (reputed by some the finest private library ever compiled) and holds unsurpassed collections of block books, incunabula, Aldines, Caxtons, and Bibles. The manuscripts, which include the 6,000 item collection of the earls of Crawford, illustrate the history of writing and illumination in the principal world languages from the fourth millennium B.C. to the present day. There are several thousand early charters, 20,000 proclamations from the principal countries of Europe of the 15th century, and autographs, prints and historic bindings.

Manchester has a wealth of literary and artistic societies. To the Literary and Philosophical Society, the foremost British scientists have first disclosed fundamental and revolutionary discoveries—including the atomic theory of matter, first propounded there by John Dalton. Visual art is represented by several vigorous groups of modern artists, and there are more than 300 local amateur dramatic societies. Manchester's musical background is especially noteworthy. An influx of German and Austrian merchants in the last century led to the formation

of the internationally famous Halle Orchestra, whose 90 musicians under their conductor John Barbirolli now play to audiences of 6,000 at the Kings Hall, Belle Vue, tour the British Isles and fulfill many engagements on the European Continent. There are numerous other orchestras and chamber concert societies, five amateur symphony orchestras, and several amateur vocal societies, whilst an important annual musical festival takes place at Alderley Edge nearby.

The city possesses six theaters, over 200 cinemas, and the celebrated Belle Vue Zoological amusement gardens of 80 acres, founded in 1836, which with their zoo, amusement park, sports stadium, dance floors and concert halls are visited annually by five million people.

Notable Buildings.—Among these are the Town Hall (Victorian Gothic revival) with historical mural paintings by Ford Madox Brown, the Central Library (Greek revival), and the Town Hall Extension (Modern), which together form a municipal block; the Cathedral, built between the 13th and 19th centuries, with its fine interior woodwork; the Rylands Library (late Gothic revival) in Deansgate, internally and externally an architectural gem; the Free Trade Hall, Assize Courts and Royal Exchange, all severely damaged by air raids; and the university, a group in varying styles. Modern functional examples include Ship Canal House, King Street; Kendal Milne's department store, Deansgate; and Midland Bank Building, King Street. Older buildings include Chethams Hospital, previously mentioned; the Wellington Inn, the last of the City's Elizabethan inns; and the more recent Moravian settlement at Fairfield. Founded by religious refugees from central Europe in 1785, this settlement (late Georgian style) includes a church, two schools, a textile factory, and nearly 100 dwelling houses. The original character remains, and descendants of the original families occupy the buildings.

Population.—The population greatly increased between 1841 and 1931 as will be seen by the following figures: (1841) 242,983; (1871) 351,189; (1891) 505,368; (1931) 766,378. This increase may be partially accounted for by the extension of the city boundaries which began in 1885. There was no census taken during World War II but the estimated population in 1939 was 727,600 and the 1951 census records the total as 703,175.

TERENCE F. USHER,
Information Officer, Manchester Corporation.

MANCHESTER, city, Iowa, and Delaware County seat, altitude 919 feet, on the Maquoketa River and on the Illinois Central and the Manchester and Oneida railroads (the latter steam), 130 miles northeast of Des Moines; also on state and federal highways. Situated in an agricultural region, the city is a dairying center and a trading point for the farmers of the county. There is a public library here.

Settled in 1850, as the town developed it was first known as Burrington; the present name was adopted in 1856. Incorporation as a city was effected in 1886. Manchester has a mayor and council, and a city manager. Pop. (1930) 3,413; (1940) 3,762; (1950) 3,987.

MANCHESTER, town, Massachusetts, in Essex County; altitude 14 feet; on Massachusetts Bay; 6 miles southwest of Gloucester; on the Boston and Maine Railroad. Originally a fishing village, it began to develop into a summer resort about 1850. Settled about 1626, the place was known as Jeffrey's Creek until 1645, when the name was changed and the town was incorporated. There is a library, and the historical society has quarters in an old home. A brick building in which ammunition was stored during the War of 1812 stands on Powder House Hill. Pop. (1940) 2,472; (1950) 2,868.

MANCHESTER, city, New Hampshire, one of the county seats of Hillsboro County, on the Merrimac River at the mouth of the Piscataquog, 18 miles south by east of Concord, and on the Boston and Maine Railroad. The first settlement was made in 1722 and for a number of years it was called Amoskeag and Tyngstown. In 1751 it was incorporated as Derryfield and in 1810 the name was changed to Manchester. It was chartered as a city in 1846.

The Amoskeag Falls (55 feet) in the Merrimac, above the city, provide extensive waterpower which, by means of canals, is made available for manufacturing. Cotton goods manufactures and woolen goods manufactures are the city's largest industries and for many years the mills of the Amoskeag Manufacturing Company were considered the largest cotton manufacturing plant in the world. Competitive conditions made the enterprise unprofitable after the depression of 1929 and the plant was closed. Local business men, determined to save for the city this valuable industry, bought the plant and leased parts of it to scores of small manufacturing enterprises which have since operated successfully. The mills have been operated for more than a century, having been founded in 1810. There are numerous other important industries in the city, especially the shoe industry. The city's area of about 35 square miles is well laid out and its residential districts present an attractive appearance. It is the seat of a Roman Catholic bishop since 1884. Near by are two notable Catholic schools, Mount St. Mary, at Hooksett; and St. Anselm's College, at Goffstown. The Carpenter Memorial Library is one of the finest structures of its kind in New England, and other outstanding buildings are those of the Currier Gallery of Art; the Institute of Arts and Sciences; the Association Canado-Américaine; and the Manchester Historic Association. City Hall, built from red brick of local manufacture, dates from 1845.

Manchester was the home of Gen. John Stark (q.v.), hero of the French and Indian, and the American Revolutionary wars. Stark Park, in which the general is buried, is one of the most beautiful in the vicinity, overlooking the Merrimac River and the Uncanoonuc Mountains; the Stark home is owned by the Daughters of the Revolution; and the site of the old Stark family homestead forms a part of the grounds of the State Industrial Home. Other points of interest are Rock Rimmon, with its story of an Indian maiden's love tragedy; Mast Road, on the Pis-

cataquog River, named because of the giant pines reserved for the British navy having been transported over it; Goffs Falls, near which was the homestead of the Goffe family, first white settlers in the district; and the Blodgett Canal, completed in 1807, once important as the last link of an inland waterway from Boston to Concord. Manchester has many fine summer homes, a considerable summer resort business, and a municipal airport. Pop. (1940) 77,685; (1950) 82,732.

MANCHESTER, town, Vermont, and one of the two Bennington County seats, altitude 694 feet, on the Rutland Railroad, 32 miles southwest of Rutland. It is also on state and federal highways, and is in a farming section. There are marble quarries near by. It makes fishing rods and flies. The town government body is a board of selectmen. The Mark Skinner Library is a memorial to one of the early families.

Manchester played a prominent part in the formative period of the state's history, when New York and New Hampshire struggled for control. The New Hampshire Grants, after the French and Indian wars, included the grant of Manchester township in 1761. Manchester was a center of Vermont activities in the American Revolutionary War. It was a junction point of stage coach traffic. Manchester is the seat of Burr and Burton Seminary, founded in 1829. It is a popular summer and winter resort town with two 18-hole golf courses and skiing on Big Bromley Mountain and in Snow Valley. A Southern Vermont artist's exhibition is held annually in the Seminary gymnasium. The town has a number of old colonial buildings, and fine modern summer homes. The sidewalks are made of marble slabs. On the green is a soldiers' monument, with a statue of a Continental soldier. The place was named after Manchester, England. Pop. (1950) 2,425.

MANCHESTER, former city, Virginia, in Chesterfield County, on the James River, opposite Richmond, to which it was annexed in 1910.

MANCHESTER SHIP CANAL, England, a great canal, by which Manchester (q.v.), an inland town, was virtually converted into a seaport. It extends 35½ miles west from Manchester to the Mersey River estuary at Eastham. There are several large petroleum refineries located on the canal.

MANCHESTER UNIVERSITY, England, known officially as Victoria University of Manchester. In 1846 a Manchester merchant, John Owens, left £96,000 for the foundation of a college for boys of 14 years and older, from Manchester and vicinity. Owens College opened on March 12, 1851, with five professors, and in the fall term there was an enrollment of 62 students. (Women students were first admitted in 1883.) A charter was granted in 1880 for the federal Victoria University, with constituent colleges at Manchester, Leeds, and Liverpool. The arrangement was short lived; by 1904 they were separate, and Owens College was incorporated into Victoria University of Manchester. The constitution of 1903 provided for a chancellor, vice chancellor, court of governors, council, and boards of faculty and students. There are nine faculties: arts, science, law, medicine, music, economic and social studies, theology, technology, and education. Manchester Museum is affiliated with the university and was established for the promotion of natural science. In 1949–1950 the enrollment was 4,697 men; 1,245 women.

MANCHURIA, man-choor'i-a (Chinese MANCHOW), a region comprising the extreme northeastern portion of China, known to the Chinese as TUNGPEI, meaning the Northeast; called MANCHUKUO during the Japanese domination. The territory lies mainly between latitudes 40° and 53° N. and longitudes 118° and 135° E. It is separated from Asiatic USSR on the north and northeast by the Amur River, on the east by the Ussuri, and on the northwest by the Argun. On the west it is bounded by the Mongolian People's Republic and China Proper; on the south by Korea and the Yellow Sea. The estimated area is 428,735 square miles; the estimated population in 1947 was 38,184,000. Its leading cities are Mukden (Shenyang), the capital, Changchun (Hsinking), Harbin (Pinkiang), Dairen (Talien). Before the Japanese seized Manchuria in 1931, the territory was divided into three provinces—Liaoning (Fengtien), Kirin, and Heilungkiang. After Chinese recovery of the northeast in 1945, it was divided into nine provinces: Liaoning, Antung, Liaopei, Kirin, Sungkiang, Hokiang, Heilungkiang, Nunkiang, and Hsingan. The former Kwantung Leased Territory, including Dairen and Port Arthur, lies on the tip of the Liaotung Peninsula which is in Liaoning Province.

It was the scene of fighting between the Chinese Nationalists and Communist troops during 1946 to 1948, the Communists gaining complete control in November 1948 with the occupation of Mukden. In 1949 Manchuria formed one of the six regional governments of the emerging Chinese People's Republic. In February 1950, agreements were signed in Moscow by Soviet Russia and the Chinese People's Republic providing for Soviet recognition of Chinese sovereignty over Manchuria, the return of the former Japanese-owned industrial installations taken from it by Soviet Russia and the restoration of full Chinese control over Port Arthur (Lushan), Talien (Dairen) and the Chinese-Changchun Railway either on the conclusion of a Japanese peace treaty or by the end of 1952.

The Land.—Vast chains of mountains ramify over the northeast, with the Khingan Mountains in the north and the Changpai Range in the south. The principal rivers are: the Amur; the Argun; the Sungari, the vast basin of which occupies the rich central part of the territory; the Ussuri, a tributary of the Amur; the Yalu and the Tumen, which separate Manchuria from Korea; and the Liao, which flows through the rich southern Manchurian delta into the Gulf of Liaotung. The climate is in most parts healthful and invigorating. In the north and more elevated parts, the cold of winter is intense, the thermometer sometimes falling to 48° below zero, and the snow lying for six months in the year. The summer temperature reaches about 90°.

The People.—South Manchuria was historically populated by Chinese. North and east Manchuria were occupied by tribes known historically as Suchen, Khitan, Juchen and Tungus. West Manchuria was partly occupied by Mongols. The Juchens were also known as Manchu who established the Manchu dynasty from 1644–1911. Present-day Manchuria, however, is mainly Chi-

nese. The great majority of Manchus have adopted Chinese names, customs and language. The Manchurian language, which became a dead language even before the end of the Manchu dynasty in 1911, was created in the 17th century patterned after the Mongolian language. The language is written from top to bottom and from left to right.

Natural Resources and Production.—The soil in the northeast is exceedingly fertile, especially in the valleys of the Liao and Sungari rivers. It is China's breadbasket; soybean, wheat, millet, sugar beets, rice, peanuts, and many other crops grow in abundance. It also produces cotton, tobacco, and a great deal of wool, while its silk industry is promising. The vast forests of the country are rich in useful timber of all kinds, such as walnut and oak, together with the soft pine and fir. They abound in wild animals: the tiger, panther, bear, fox, wolf, and stag, as well as the eagle and other birds of prey. The rivers abound with fish. But what makes the region particularly valuable to China is its underground wealth. Manchuria has 80 per cent of China's iron deposits, and some of her best coal deposits, including one of the largest open-pit coal mines in the world. No large-scale oil reserves have been found in the northeast, but its rich deposits of oil-bearing shale supply crude oil while its rich coal reserves offer a bright future for the gasoline-extracting industry. As for other minerals, the aluminum and magnesium reserves are very large. There are also important reserves of tungsten, tin, gold, silver, zinc, copper, asbestos, molybdenum, limestone, marble, and other minerals. The territory has a huge salt production to substantiate a vast chemical industry.

There is a good network of railways in Manchuria, with a total mileage (1947) of 8,000 miles. With its fine harbors, the area is capable of a high degree of industrialization.

Finance.—In the years under Japanese domination, Manchuria belonged to the Japanese yen block and a paper currency known as the Manchukuo yen was in circulation. After the Soviet declaration of war on Japan on Aug. 9, 1945, the Soviet troops occupying Manchuria issued in undetermined amount a special Soviet military note for circulation in Manchuria. These notes were later redeemed by the Chinese government. The present (1947) currency in circulation is known as the northeast currency note, each dollar of which is equivalent to 12.50 Chinese National currency dollars. Because of its past high production and sounder financial foundation, inflation in Manchuria is not so severe as it is in China Proper. Consequently its currency is in a more advantageous position than the Chinese National currency.

Government.—After the Chinese recovery of Manchuria, it was divided into nine provinces and nine provincial governments were established to handle all civil administration in the territory under the direction of the President's Headquarters in the northeast established in Changchun. A Northeast Economic Council was established to direct and coordinate all economic activities in the area. A Northeast Peace Preservation Headquarters was established to direct all military activities. The provincial governments have different departments in charge of civil administration, finance, education, reconstruction, and other duties. Under the provincial governments are county governments administering county affairs. Provincial political assemblies serve as provincial representative bodies in their respective provinces. Many of the provincial governments however, are unable to function as their territories are under Communist control. The Communists have their own administrative organs in their areas.

Way of Living.—As Manchuria is now predominantly Chinese, the way of living of people there is not different from north China Chinese. Both men and women dress in long gowns. In winter, most women dress in long trousers to protect them from the severe weather. Their staple food is wheat flour and *kaoliang*. Their religions, like that of north China Chinese, include Buddhism, Confucianism, Islam, Taoism, and Christianity. There is complete freedom of religion in Manchuria as in other parts of China.

Education.—The education system in the northeast is the same as other parts of China. Theoretically, children are required to go to school when six years of age. They have six years of primary school education. The middle schools are divided into junior and senior middle schools each of three years. The colleges and universities are four-year institutions. There are also normal schools and professional schools for students who want to go into training for teaching or other professions after finishing primary schools. Because of the inadequate number of schools, there is a high rate of illiteracy in Manchuria, especially among the adults.

History.—Manchuria came within the horizon of the Chinese Empire in the 3d century B.C. and the Liao River valley was already then populated by Chinese settlers. Manchuria began to play an important part in Chinese history when the Khitans founded the Liao dynasty in the 10th to 12th centuries and when the Juchens founded the Gold dynasty in the 12th and 13th centuries. Both dynasties, however, limited themselves to Manchuria and north China. It was when the Juchens founded their Ching (Manchu) dynasty in the 17th century that they conquered other parts of China. The founder of the Manchu dynasty was Nurhachi who began his career of empire building in the area around the middle Sungari, near present Changchun. He rose from very small beginnings but was soon able to conquer other clans and tribes, and create a big warlike state outside of the Great Wall, laying the ground for further invasion of China Proper by his successors in early 17th century. Finally, his successors were able to overrun entire China and established the Manchu dynasty in 1644. Thereafter they made Manchuria a crown reserve territory and Chinese immigration, which had been in progress for centuries, was forbidden. But in practice, Chinese immigrants were able to move into Manchuria in increasing numbers during the Manchu dynasty which eventually allowed this movement in the later 18th century.

For a considerable time prior to 1891, when the first sod was turned for the construction of the Trans-Siberian Railway, the Russian government was anxious to secure control of Manchuria. Japan, meanwhile, was casting covetous eyes upon the mainland of Asia, and especially upon the northeast. When China was defeated in the first Sino-Japanese War in 1894–1895, Japan secured from China through the Treaty of Shimonoseki (April 17, 1895), among other things, the cession of Formosa (Taiwan), Pesca-

dores Islands, and the Liaotung Peninsula on which tip lie Dairen and Port Arthur in southern Manchuria. Six days after the signing of the treaty, the Japanese government received notes from the governments of Russia, Germany, and France "recommending" that Japan restore to China this peninsula. Japan, weak though victorious, accepted this "recommendation" and surrendered her claim to the peninsula in return for an increased indemnity from China.

Immediately after this, Russia began to push her way into Manchuria. In 1896, a Russian financial interest secured the privilege of building the Chinese Eastern Railway, which is a spur of the Trans-Siberian Railway and a shortcut to Vladivostok. Another line extended from Harbin to Port Arthur (Ryojun). In 1898, Russia demanded and obtained a lease of the Liaotung Peninsula from China for 25 years, and the right to develop Port Arthur as a naval base.

The Russians occupied the northeast during the Boxer Rebellion of 1900, although no actual fighting took place in that area. After the conclusion of the treaty of 1901, the Russians refused to withdraw their troops from the northeast until they secured further concessions from China which gave them a "railway zone" along the railways and other special economic interests in the region. In the next few years, through arrangements with other powers and secret treaties concluded with China, Russia established her sphere of influence in the northeast.

The Russo-Japanese War in 1904–1905, which was fought on Chinese territory and without any respect for China's territory rights as a neutral, saw Russia's defeat. The resulting Treaty of Portsmouth (Sept. 5, 1905) gave Japan, among other things, the "right of succession" to the Changchun-Port Arthur section, later known as the South Manchurian Railway, of the Chinese Eastern Railway, and the lease of the Liaotung Peninsula. The treaty also provided that the warring parties agreed to withdraw their troops from Manchuria with the exception of the Liaotung Peninsula, but reserved to themselves the right to maintain railway guards along their respective railway lines. (See PORTSMOUTH, TREATY OF.) The provisions of the Treaty of Portsmouth concerning China were substantiated by the Sino-Japanese treaty of Dec. 22, 1905.

In a series of secret treaties between Japan and Russia, the two countries divided Manchuria into two spheres of influence, under Russia in the north and Japan in the south. The Twenty-one Demands made by Japan in 1915 further consolidated her position and economic, political, and military privileges in Manchuria. Her special position in Manchuria was recognized by the United States in the Lansing-Ishii agreement in 1917. The Nine-Power Treaty of 1922 upheld the Open Door policy toward China but left Japan in possession of her previous gains in Manchuria. To Japan, Manchuria was in actuality her protectorate. Her support of the late Marshal Chang Tso-lin in defiance of the Chinese government and her "warning" to Chang Hsueh-liang against his full adherence to the Chinese National government in 1928 clearly indicated Japan's stand. Chang, however, ignored the Japanese warning and announced his allegiance to the National government on Dec. 31, 1928. After years of quasi independence, the northeast again became, *de facto* as well as *de jure*, an integral part of the Chinese Republic.

In 1924, the Soviet government renounced all rights and privileges which the czarist regime had acquired by unequal treaties in Manchuria and other parts of China.

Under the overall supervision of the National government, Chang Hsueh-liang further intensified the reconstruction program launched by his father, Chang Tso-lin, to break the Japanese hold on Manchuria. This prompted the Japanese to take direct action. On Sept. 18, 1931, Japan engineered the so-called Mukden Incident and within a few days occupied all of Manchuria. The puppet state of Manchukuo was established under Japanese direction on March 9, 1932, with Pu-yi (Hsüan T'ung) as the chief executive. He was later proclaimed the emperor of Manchukuo on March 1, 1934.

China appealed to the League of Nations for the peaceful settlement of the Mukden Incident. The League, after prolonged deliberations, sent a commission of inquiry to the northeast under the earl of Lytton. The commission's report, known as the Lytton report (published Oct. 2, 1932), said that "the military operations of the Japanese during this night (September 18) cannot be regarded as measures of legitimate self-defense." And in regard to the establishment of the puppet state in the northeast, the report said the two factors without which the new state could not have been formed "were the presence of Japanese troops and the activities of Japanese officials, both civil and military. . . . For this reason the present regime cannot be considered to have been called into existence by a genuine and spontaneous independence movement."

Meanwhile, Chinese guerillas resisted with what they had against Japan's attempt to impose Japanese rule over Manchuria.

The first few years of the Manchukuo state saw large-scale "pacification" campaigns launched by the Japanese Army to suppress Chinese resistance. Beginning from 1936, Japan launched a five-year plan in Manchuria to make the territory the arsenal and granary of the Japanese Empire through the exploitation of the rich resources and cheap labor in the northeast. From the beginning, the Manchukuo economy was a planned economy. The Manchukuo five-year plan, revised in 1938, laid special emphasis on strategic industries and supplemented the Japanese four-year plan. Most of the Manchukuo products were raw material or half-finished products to supply Japanese factories. Japan also dominated all economic life of the northeast. Early in 1934, by the Oil Monopoly law, all foreign companies, including Standard Vacuum Oil and Texas Oil of the United States, were forced out of business. By the Emergency Foreign Trade Control law of 1936, the Foreign Trade Control law of 1937, and other trade measures, the importation and exportation of practically all commodities became a matter of exclusive privilege of Japanese interests. Two Japanese-owned companies controlled all the industrial enterprises. The South Manchurian Railway Company monopolized the railways, highways, harbors, bus and steamship services, docks and warehouses, and coal and oil at Fushun. The Manchurian Industrial Development Company controlled the coal, iron and steel, light metals, automobile and airplane industries. The Agricultural Produce Corporation controlled all crops from planting to consumption in Manchuria.

To complete the Japanese control over Manchuria, the USSR sold her share in the Chinese Eastern Railway in Manchuria to Manchukuo in 1935.

The recovery of the northeast was one of China's war aims. The Cairo declaration in 1943 stated, among other things, the return of Manchuria to China after the war. (See PACTS AND CONFERENCES.) The letter and spirit of this declaration, however, was violated by one of the Yalta secret agreements in which, without China's knowledge and consent, the United States and Great Britain agreed that the USSR, in return for going to war against Japan, would receive a number of rights in Manchuria. The United States was to use her influence to make the Chinese accept the Yalta *fait accompli.* Accordingly, the Chinese government signed, on Aug. 14, 1945 in Moscow, with the Soviet government a treaty which provides, among other things, the independence of Outer Mongolia; the joint ownership, for 30 years, of the Chinese Changchun Railway which comprises the former Chinese Eastern Railway and the South Manchurian Railway; the establishment of Port Arthur as a joint Chinese-Soviet naval base under Soviet garrison; and the establishment of Dairen as a free port with a Soviet port master but a Chinese mayor.

The USSR declared war against Japan on Aug. 8 (effective Aug. 9), 1945, six days before Japanese surrender. Soviet troops occupied the entire Manchuria. After repeated negotiations, they evacuated the northeast, with the exception of Port Arthur and Dairen, in April 1946, but not until they had stripped the northeast of its industrial and communcation equipment and materials. Meanwhile, the Soviet evacuation coincided with the arrival in Manchuria of Chinese Communist troops who were also able to find exactly where the Japanese arms, which were surrendered to the Soviet troops, were stocked.

Chinese Communist troops took Changchun, capital of the northeast, on April 17 and Harbin on April 25, 1946. They also took over northern, eastern, and southern Manchuria following the evacuating Soviet troops. Government troops recaptured Changchun on May 23. In cities evacuated by the Chinese Communists, whatever industrial equipment had been left by the Soviet troops was destroyed by the Communists. Fighting continued in the northeast between nationalist and Communist troops into 1947.

Since the Chinese recovery of the northeast, the territory has been under the administration of provincial governments which are under the overall supervision of the President's Headquarters in the northeast. A Northeast Economic Council directs all economic activities in the territory. The Chinese Communists have their own system of administration in areas under their occupation.

Chinese News Service.

MANCHUS, a Tatar people of Tungusic origin, descendants of the Jurchin or Niu-chi, who overran northern China in the 12th century and established the Kin or Golden dynasty, later overturned by the Mongols, and of the tribes who followed Nurhachu (1559–1626) and his successors in his conquest of Liao-Tung and Liao-si, in the first half of the 17th century, who aided the Chinese general, Wu-san-kwei, in suppressing the rebel Li-tse-Ching, and who retained the country for themselves, establishing in 1643 the Ta-Tsing, or "Great Pure" dynasty which ruled China down to the establishment of the republic in 1912. They form a very small minority of the population of China to-day; they are a quiet, inoffensive people noted for their politeness. They now speak the Chinese language, their own tongue being wellnigh extinct. Physically they are rather tall, with mesocephalic head. The famed Chinese queue, but recently abolished, was introduced by the Manchus and was at first an insignia of the subjection of the Chinese to the Manchus. Buddhism in the Chinese form of to-day also dates from the Manchu conquest. For the history of their conquest and rule in China see CHINA, *History.* Consult Giles, *China and the Manchus* (Cambridge 1912); Kent, P. H. B., *The Passing of the Manchus* (London 1912); Ross, *Manchus; or The Reigning Dynasty of China, their Rule and Progress* (London 1891).

MANCINI, män-chē'nē, a name borne by the five nieces of Cardinal Mazarin. They were born in Rome and summoned by their uncle to Paris, where they played a conspicuous part in the court of Louis XIV during the early years of his reign. They were: (1) LAURE (b. 1636; d. 1657), the amiable and pious companion of Louis XIV's boyhood. She became the mother of Louis, Duke of Vendôme, one of the greatest generals of the Grand Monarque. (2) MARIE (b. 1639; d. about 1715), for whom the king conceived a violent affection, but in 1661 Mazarin gave her in marriage to Prince Colonna, constable of Naples. (3) OLYMPE (b. 1640; d. 1708), a witty and attractive woman, who became wife of Eugène de Savoie-Carignar, Count of Soissons, and mistress of the queen's household. (4) HORTENSE (b. 1646; d. 1699), the most attractive and beautiful of the Mancini. In 1666 she left her husband, the Duke de Mazarin, and became one of the chief beauties of King Charles II's court. The king pensioned her, and after the Revolution of 1688 she lived in retirement in Chelsea. (5) MARIE ANNE (b. 1649; d. 1714) was the wittiest and most vivacious of the sisters. In 1662 she married the Duke de Bouillon, and her salon became the center of social and intellectual life at Paris. She patronized La Fontaine, Corneille and Molière. She died in Clichy. Consult Chatelauze, *Louis XIV et Marie Mancini* (Paris 1880); Williams, A. N., *Five Fair Sisters* (New York 1906).

MANCO INCA I, ĭng'ka, Peruvian ruler: b. about 1500; d. 1544. He was the second son of the inca Huayna Capac (q.v.), who died about 10 years after the first arrival of the Spaniards, dividing his kingdom between his legitimate successor, Huascar, and a younger son, Atahualpa. The latter, afer having made war upon Huascar, and put him to death, was himself captured and executed in 1533 by Pi-

zarro. Shortly afterward Manco appeared in the Spanish camp to announce his pretensions to the throne and claim Pizarro's protection. The conqueror received him cordially, and made it his first care after the taking of Cuzco to place him on the throne. After in vain petitioning for power to exercise the sovereignty, he withdrew secretly from Cuzco, but was brought back and imprisoned. Again escaping, he roused the whole nation to arms against the invaders, and appeared before Cuzco (February 1536) with a countless host of Indians who covered the surrounding hills. He destroyed a large part of the city by fire and reduced the Spaniards to extremities; but after the siege had lasted over five months, had to withdraw on account of the scarcity of food. Defeated subsequently by Almagro and forsaken by most of his warriors, he fled to the Andes, and for several years maintained his independence, sallying forth as occasion offered at the head of a few brave followers, always eluding pursuit in the wilds of the Cordilleras, and in the event of civil war among the foreigners throwing his weight into the weaker scale in order to prolong their contests. He was killed by a party of Spaniards belonging to the younger Almagro's faction, who on the defeat of their leader had taken refuge in the Peruvian camp.

MANDÆANS, măn'dē'ąnz, an ancient Oriental religious sect of mixed Christian, Jewish and heathen elements. They are still found on the east shore of the Tigris, working as jewelers, blacksmiths, carpenters, etc. Their religion is a kind of Gnosticism, retaining various Jewish and Parsee elements. They worship a number of personifications, particularly of the attributes or names of God. They publicly call themselves Sabians (*Subbâ,* "baptists"), thus professing to identify themselves with the Sabæans tolerated in the Koran. They were formerly called Christians of Saint John the Baptist from their habit of baptism or ablution. They have five important sacred books: 'Sidrâ rabbâ' ("the great book"), called also "ginza," "treasure"; 'Sidrâ de Yahyâ' ('Book of John'); the 'Qolasta,' a collection of hymns; 'Diwân,' a ritual; and 'Asfar Malwâsê,' a manual of astrology. The Mandæans had three degrees in the priesthood, with a supreme official (Rish ammâ) as the source of both civil and ecclesiastical authority. The priests officiate in white robes, barefooted, and women may be admitted to their order.

MANDAITES. See NAZARENES.

MANDALAY, măn'dą-lā, chief town of Upper Burma, situated on the Irrawaddy River about 360 miles by air line north of Rangoon. It was founded by King Mindōn in 1856–57, and was the capital of independent Burma until the British captured it in 1885. After the treaty of 1886, by which the King lost his throne, it was the capital for a number of years of Upper Burma. The area within the old city walls is called Fort Dufferin, though no longer used as a fort. In the center of this area stood the Palace of the Kings, a group of wooden structures, many of them highly carved and adorned with gilt. They rested on a brick platform 900 feet long by 500 feet wide, and 6 feet high. There were in the city many pagodas and monastic buildings, perhaps the most famous being the Aracan Pagoda, containing a brazen image of Buddha 12 feet high, and the Kuthodaw Pagoda, 110 feet high. Kipling immortalized the city in his poem 'Mandalay,' which was set to music by Oley Speaks. Following the outbreak of the war in the Pacific in 1941, the Japanese, in the spring of 1942, invaded and overran Burma, capturing Mandalay on 1 May. At that time they described it as a «smouldering mass of ruins.» When the Japanese entered the city it had been burning since 4 April, and, according to dispatches by American newspaper correspondents, about the only thing then left standing were the walls of the Palace of the Kings. The city had been defended by British and Chinese troops, but the overwhelming superiority of the Japanese forces compelled them to withdraw after stubborn resistance. Mandalay's population is mixed but the greater portion (over 77 per cent) are Burmese Buddhists. Pop. (1931) 149,932.

MANDAMUS, *in law,* a writ issued by a superior court and directed to some inferior tribunal, or to some corporation or person exercising public authority, commanding the performance of some specified duty. In general practice in the United States a mandamus issues where a party has a right to have a thing done, and has no other remedy, and in some cases where he has another but a tedious and inadequate one; and must be applied for without delay. It is either in the alternative, ordering the court, corporation or party to which or whom it is directed to do the thing specified, or to appear and show cause why it should not be done; or absolute, commanding the thing specified to be done without any condition or alternative. The writ is usually first issued in the alternative, and in case of there being no appearance, or no sufficient cause to the contrary being shown an absolute mandamus is issued. The cases enumerated for the issuing of this writ are — to compel the party applying to be restored to some office or franchise of a public nature, whether temporal or spiritual; for the production, inspection or delivery of public books and papers; to oblige bodies corporate to affix their common seal; or to compel the holding of a court. It may be directed to an inferior court, ordering it to proceed in the hearing of a cause, or to enter up a judgment. Consult Bailey, W. F., 'Treatise on the Law of Habeas Corpus and Special Remedies' (2 vols., Chicago 1913); Spelling, T. C., 'Treatise on Injunctions and Other Extraordinary Remedies' (2d ed., Boston 1901) and Wood, H. G., 'Treatise on the Legal Remedies of Mandamus and Prohibition' (3d ed., Albany 1896).

MANDAN, a tribe of American Indians of the Siouan family, the remnants of which number less than 300, are settled upon the Fort Berthold Reservation in North Dakota. In remote times they are supposed to have migrated from the lower Missouri but had occupied the North Dakota region for centuries before they were first visited by Verendrye in 1738. In 1804 they were found by the Lewis and Clark Expedition (q.v.) occupying two villages at the mouth of the Knife River. In 1837 when a smallpox epidemic destroyed thousands of American Indians the Mandans were still further reduced in numbers from 1,700 to less than 400. In

1846 the remaining families of the tribe took up their residence at the Fort Berthold Reservation. The Mandans were not a nomadic people, but resembled the Pawnees, living in log houses with village administration and local government. They were an agricultural people, raising corn, tobacco and other crops.

MANDAN, N. Dak., city and Morton County seat; alt. 1,642 feet; on the navigable Missouri River opposite Bismarck; it is served by the Northern Pacific Railroad. The city is situated in a wheat growing and stock raising district; it is a Northern Pacific division center, and has railroad car shops. There are flour mills and creameries, and in the vicinity is the U.S. Northern Great Plains Experimental Station. It has had commission government since 1907. Pop. (1940) 6,685; (1950) 7,298.

MANDARIN, măn'dȧ-rĭn, term applied, in the empire of China, to government officials, either civil or military. The nine grades of mandarin were distinguished by the color of the button on the hat of office. The word mandarin is derived ultimately from the Sanskrit *mantrin,* counselor; the Chinese equivalent is *kuan.*

MANDARIN DUCK, a small Chinese duck (*Aix galericuta*) closely related to the American wood-duck (*A. sponsa*), and dressed in an exceedingly beautiful plumage of metallic green, purple, chestnut, white, and black. It has long been domesticated by the Chinese, and as it is said to pair for life, is held up by them as a model of marital virtues; it has been introduced upon park waters and ornamental grounds in America and Europe.

MANDAT, măn-dä, the name given to a kind of paper money in the French Revolution. After the assignats (q.v.), which had been kept in circulation by the violence of Maximilian F. M. I. de Robespierre, had lost all credit, a new money was created—the mandats—founded, like the assignats, on the credit derived from the confiscated property, but with the essential difference that specific pieces of property, enumerated in a table, were pledged for the redemption of the bills; the assignats furnished only a general claim. These mandats were issued in accordance with the law of 1796. A forced circulation was given to them, by which the government was enabled to defray the expenses of the approaching campaign.

MANDATE, *in law,* a term derived from the Roman civil law. It may be defined as a bailment (delivery) of a chattel or chattels to a person who is to do something with or about the things bailed, entirely without compensation.

MANDATES SYSTEM. This form of government for dependent territories taken from Turkey and Germany in World War I vested sovereignty in the League of Nations, which entrusted one or other of the Allied Powers with their administration. The principles of the system were laid down in Article 22 of the Covenant of the League. The first is that, to the territories concerned,

"which are inhabited by peoples not yet able to stand by themselves in the strenuous conditions of the modern world, there should be applied the principle that the well-being and development of such peoples form a sacred trust of civilization."

The next is that

"the tutelage of such peoples should be entrusted to advanced nations . . . and that this tutelage should be exercised by them as mandatories on behalf of the League."

The mandatory was required to render an annual report to the League on the territories committed to its charge; the League defined the degree of control to be exercised; and a Permanent Mandates Commission was created to advise the Council of the League on all matters relating to the observance of mandates. The mandates were divided into three groups, "A," "B" and "C," appropriate to the stage of development of the people and the geographical and economic circumstances of each of the territories. "A" mandates were applied to certain communities formerly belonging to the Turkish Empire, namely, Palestine, Transjordan, Iraq, Syria, and Lebanon; the first three were entrusted to Great Britain, and the remaining two to France. These communities were considered to have reached a stage of development where their independence could be provisionally recognized, subject to administrative advice and assistance from the mandatory until they were able to stand alone. "B" mandates were applied to ex-German colonies in Central Africa not ready for independence, namely Cameroons (divided into British and French spheres), Togoland (likewise partitioned), Tanganyika (a British mandate), and Ruanda-Urundi (a Belgian mandate). In the "B" mandates the mandatory Power was responsible for the administration under certain specified conditions designed to prevent abuses and to ensure that the welfare of the inhabitants should be the first consideration. The mandatory was obliged to secure equal opportunities for the trade and commerce of all members of the League of Nations. "C" mandates were applied to territories which, owing to their particular circumstances, could best be administered as integral portions of the mandatory's territory. The laws of the mandatory Power might be applied to them, with such local modifications as circumstances might require, and subject to safeguards in the interests of the natives. The "C" mandates comprised South West Africa (assigned to the Union of South Africa), New Guinea (to Australia), Western Samoa (New Zealand), Nauru (British Empire—administered by Australia), and the Caroline, Marianas, and Marshall Islands (assigned to Japan). The mandatories were forbidden to establish defense bases in the mandates and to organize native military forces for use outside their own territories, although the latter proviso was waived in respect of the French spheres of the Cameroons and Togoland. By treaties concluded with the mandatory Powers, the United States secured the same rights as League members in respect of all mandates except New Guinea, Western Samoa, Nauru, and South West Africa.

During 1920–1922 the terms of the mandates were approved by the League of Nations with respect to all territories with the exception of Iraq; the treaty regulating relations between Iraq and Great Britain was approved in 1924. All "A" mandates had terminated by the end of 1948, the countries having obtained the independence which had been envisaged. After World War II the mandates system had automatically suffered the same fate as the League of Nations;

and the United Nations, the successor international organization, assumed responsibility for all "B" and "C" mandates (except South West Africa) under the trusteeship system (q.v). Consult Wright, Q., *Mandates under the League of Nations* (Chicago 1930); League of Nations, *The Mandates System* (Geneva 1945).

MANDERSON, Charles Frederick, American lawyer and politician: b. Philadelphia, 9 Feb. 1837; d. 1911. He received his early education in Philadelphia, removed to Canton, Ohio, in 1856, studied law and was admitted to the bar in 1859. He was city attorney in Canton, 1860–61; at the outbreak of the Civil War he enlisted as a private in the Union army, served in the campaigns in the Middle West and rose through the intermediate grades to the rank of brigadier-general of volunteers. He was severely wounded at the battle of Lovejoy's Station, Ga., and resigned from the army in 1865 on account of his wounds. He resumed his law practice in Stark County, Ohio, but removed to Omaha, Neb., in 1869. Here he soon became prominent in public affairs, was city attorney for more than six years and a member of the Nebraska Constitutional Conventions in 1871 and 1874. In 1883 he was elected to the United States Senate, serving until 1895, and being chosen speaker pro tem in two Congresses, 1889–93. After 1895 he was solicitor for the Burlington system of railroads, west of the Mississippi; and was president of the American Bar Association in 1900–01. He published 'The Twin Seven Shooters' (1902), and several addresses on political and legal subjects.

MANDEVILLE, Bernard de, English writer: b. Dort, Holland, c. 1670; d. London, 21 Jan. 1732 or –33. He was educated at the Erasmus School, Rotterdam, and at the University of Leyden, where, in 1691, he received the degree of doctor of medicine. The date and occasion of his removal to England are unknown; but he appears soon to have settled in London where with but small success he practised his profession. He lived obscurely, with distillers and Dutch merchants as his ordinary acquaintances. Franklin, in his 'Autobiography,' records that in 1725, at "the Horns, a pale-ale house in —— Lane, Cheapside," he was introduced "to Dr. Mandeville, author of the 'Fable of the Bees,' who had a club there, of which he was the soul, being a most facetious, entertaining companion." Franklin at this time was merely a struggling young printer, unknown to fame: Mandeville gained no honor from his acquaintance. Mandeville had, however, a few acquaintances outside his tavern circle. Of these, the most important was Lord Macclesfield, the chief justice, at whose house Mandeville also met Addison. Of their world, however, Mandeville was never a real part, socially or intellectually.

Mandeville wrote much both in verse and prose; but his chief claim to notoriety was the authorship of the 'Fable of the Bees.' This, in its earliest form, consisted solely of a rude poem, in octo-syllabic couplets far from Miltonian, entitled, 'The Grumbling Hive, or Knaves turned honest.' In it, he related how, so long as they remained unscrupulous, the bees increased in numbers and prosperity, and how by their moral reformation the bees gained only their material ruin. He concluded that

> "To enjoy the world's conveniences,
> Be famed in war, yet live in ease,
> Without great vices is a vain
> Utopia, seated in the brain.
> Fraud, Luxury, and Pride must live,
> While we the benefits receive."

Of this piece, the earliest known edition is that of 1705. Mandeville's assertion that an earlier edition was printed is unsupported by evidence. In 1714, Mandeville reprinted the poem with prose additions, the whole bearing the new title 'The Fable of the Bees, or Private Vices Public Benefits.' This he further enlarged in the edition of 1723.

At this point, the grand jury of Middlesex interfered, and, in July 1723, presented the 'Fable' as a nuisance. Immediately the book became a subject of general attack. Richard Fiddes and John Dennis in 1724, William Law, Francis Hutcheson in 1725–27, Archibald Campbell in 1728 and Bishop Berkeley in 1732, all assailed Mandeville in turn. By Law and by Berkeley, Mandeville was intellectually outclassed; but he held up his side of the argument, adding to his 'Fable,' in successive editions, tract after tract. That the 'Fable' should be thus attacked is not surprising. Its fundamental thesis, that private vices are public benefits, was as subversive of morality as its illustrative material was foul and its style plausible and forceful. Whether Mandeville was sincere or ironical in his argument is in dispute. That he thoroughly enjoyed his own foulness cannot be doubted. But at least he accomplished one good thing; he pricked the sham morality of Shaftesbury. Other works by Mandeville are 'Esop Dressed, or a Collection of Fables Writ in Familiar Verses' (1704); 'Free Thoughts on Religion' (1720); 'Enquiry into the Causes of the Frequent Executions at Tyburn' (1725). Consult Robertson, J. M., 'Pioneer Humanists' (London 1907).

MANDEVILLE, Sir John. The alleged author of a mediæval book of travels which enjoyed great popularity. A large number of manuscripts are in existence, the most important of which are in Latin, French and English. The earliest version is in French, dating from the latter part of the 14th century, and upon this all the others appear to be more or less directly based. There is no English manuscript antedating the 15th century. The statements in the prologue regarding the translation are to be distrusted, and the autobiographical matter is contradictory. An exaggerated importance has sometimes been attached to the compiler of the work as the father of English prose, because of the statement in one of the English manuscripts that he had translated it out of French into English in order that every man of his nation might understand it. Errors in the translation prove that the man who wrote the French version and the man who made the English rendering cannot have been one and the same person.

The travels consist, in the main, of an account of the Holy Land and the routes thither, followed by a description of various parts of Asia. The narrative is almost wholly spurious, being made up of paraphrases and borrowing from various sources — travel-books, bestiaries, works on Eastern manners, legends, romances,

tic. The first half of the book is chiefly dependent upon the travels of William of Boldensele, a German who flourished in the 14th century, and the second part upon the work of Friar Odoric of Pordenone (about 1330). The only portions which may reflect personal experience are those dealing with Jerusalem and Egypt, which it is not impossible that the compiler may have visited. The story abounds in all kinds of adventures and marvels, related with an air of sober truth. There are accounts of monsters and curiously misshapen men, of regions haunted by devils, of the Fountain of Youth, of the Phœnix, of the realm of Prester John, etc. The narrator must have been a man of wide reading, and he certainly displays considerable skill in the selection and arrangement of his materials.

In the prologue the author states that his name is "John Maundeville, knyght," b. at Saint Albans, England, and that he "passed the see," in 1322 (1332), whereupon he traveled through various countries. The epilogue asserts that the gout forced him to return, and that he occupied his leisure in writing his experiences. It has been found impossible to identify him with any historical John Mandeville.

The tomb of the reputed author of the 'Travels' was long shown at Liège, with an inscription to "Joannes de Mandeville, alias dictus ad barbam." Important in this connection is the testimony of one Jean d'Outremeuse, in a 'Myreur des Histors,' now lost, to the effect that there died in Liège, in 1372, a physician named Jean de Bourgogne, "dit à la barbe," who declared himself on his death-bed to be "Jean de Mandeville, chevalier, comte de Montfort en Angleterre," his real name having been concealed because of a crime committed in England. The veracity of D'Outremeuse is open to suspicion, but it has been thought that this Jean de Bourgogne may have been one John de Burgoyne, who was forced to leave England in 1322, and that he compiled the 'Travels,' borrowing the name of one John de Mandeville, who was concerned in the murder of Gaveston. At all events, Jean de Bourgogne was known in mediæval times as the author of a treatise on the plague, which is bound up in one instance with a version of the 'Travels.' It seems probable, then, that this man, whatever his past history may have been, was the real author of the latter work, and that he preferred to conceal his identity under the pseudonym of Mandeville.

WILLIAM WITHERLE LAWRENCE,
Professor Emeritus of English, Columbia Univ.

MANDINGOES, măn-dĕng'gōz, a linguistic group of West Africa, remarkable for their intelligence. The original country of this people was the north slope of the high table-land of Senegambia, between the head-waters of the Niger and Senegal. Their language is more widely diffused, and more employed by translators than that of any of the other languages of West Africa. They formed at one time a single large empire, but are now widely scattered. The hair is woolly but other facial negro characteristics are absent. From the Arabs they have derived a high degree of culture and are far removed from savagery. Their religion is Mohammedan. Consult Johnston, Sir H. H., 'Liberia' (2 vols., London 1906).

MANDIOCA, the staple food of Brazil. See CASSAVA.

MANDOLIN, a musical instrument, belonging to the lute species, played with a quill or plectrum as well as with the finger. It is of Italian origin, but latterly has become common in all civilized countries. In the usual form it has four pairs of metallic strings and a finger-board or neck with numerous frets across it. Operatic composers have occasionally employed the mandolin to obtain characteristic effects. The commonest form of this instrument is the Neapolitan with a range $G — E^3$. Other varieties are the Milanese with six strings, the Spanish with six double strings and the Turkish with seven double strings. There are four double strings in the Neapolitan.

MANDRAGORA. See MANDRAKE.

MANDRAKE, a genus of perennial herbs (*Mandragora*) of the order *Solanaceæ*. The species, of which only three are described, are almost stemless, thick-rooted and large-leaved, with rather large whitish or bluish bell-shaped flowers, followed by globular berries. The plant is chiefly interesting from the numerous allusions to it in old writings, the superstitions relating to it being mainly in connection with its fetid, reputedly poisonous root, which, from a fanciful resemblance of its roots to the human figure, was considered an aphrodisiac.

The May-apple (*Podophyllum peltatum*), of the order *Berberidaceæ*, is often called "mandrake" in the United States, where it is common east of the Mississippi River. It is a perennial herb which sends up umbrella-shaped leaves, usually two at the summit of a stem and bearing one or two creamy, fragrant flowers in the axil. A mawkish yellow fruit about the size of a large cherry develops during early summer. The fruits "are relished by pigs and boys." The creeping rootstocks have been used medicinally.

MANDRILL, the largest and one of the most repulsive and savage of the African baboons. (See BABOON). Consult DRILL.

MANED WOLF, a long-legged, slender-bodied, long-nosed, brightly reddish wolf (*Canis jubatus*) of eastern South America, which may be regarded as one of the "aguaras" or fox-dogs (q.v.). It is a denizen of forests, not being known south of the northern edge of the Argentine pampas; and goes about alone at night and secretly, seeking its food, which consists mainly of small rodents, frogs, insects and the like, and even some fruit. It will sometimes attack sheep, but is remarkably timid, and no one fears it.

MANES, mā'nēz, among the Romans, the souls of the dead. The good spirits were also called *lares*, and the evil *larvæ*. The manes were reckoned among the infernal gods; but a belief was prevalent that they sometimes appeared upon the earth in the form of ghosts, particularly on the 30th of August, 4th of October and 7th of November; whence the Romans considered these unlucky days.

MANES WORSHIP, from Roman *Manes* (q.v.), a term to denote the worship of the dead, whether of an ancestor of the particular worshiper or of some deified hero of his race. Herbert Spencer thinks it developed from the belief in an other self, which survived after death, and the manes worship was the outcome of a desire and endeavor to propitiate the ghost. Sir John Lubbock says of manes worship that it "is natural development of the dread of ghosts."

MANET, mą'nā', **Edouard,** French artist: b. Paris, 23 Jan. 1832; d. Paris, 30 April 1883. Originator of the Impressionist movement, which finds its greatest expression in Claude Monet, Manet worked in an original manner before Impressionism was thought of. He rendered great service to the movement, not solely by his works, but by taking upon himself the criticisms directed upon the whole Impressionist School. Dégas, Monet and Renoir, bold in art but timid of nature, resigned themselves to the misunderstanding and hostility of the public; but the more courageous Manet defended the movement with a strong controversial pen. He fought valiantly for himself and all the artists associated with his name.

Manet studied with Couture about 1850 and traveled throughout Europe, growing enthusiastic over Rembrandt, Tintoretto, Velasquez and Goya, painted some fine works such as the 'Buveur d'absinthe' and the 'Vieux musicien' and in 1861 exhibited at the Paris Salon portraits of his parents and the 'Guiterero.' His 'Déjeuner sur l'herbe' attracted much attention. 'Olympia' (in the Luxembourg) attracted more hostile criticism. It was a technical experiment significant for the period of its composition. 'Angels at the Tomb of Christ,' 'Lola de Valence,' 'Toréador tué,' 'Acteur tragique,' 'Jésus insulté,' the 'Gitanos,' 'Rouvière' and portrait of 'Éva Gonzalès' appeared before 1870. About this time Manet cast his lot with the Impressionists. The 'Fight of the *Kearsarge* and the *Alabama*' announced this transformation of his style and was followed by 'Musique aux Tuileries,' the 'Bal de l'Opéra,' the 'Bon Bock' and the 'Liseur.' 'Argenteuil' (1875) shows his atmospheric researches. Next came a portrait of 'Desboutin' and the 'Linge' (1876), a portrait of 'Faure' as "Hamlet" (1877); 'La Serre,' a symphony in blue and white in which George Moore, the author, appears in boating costume (1878); the scene in the 'Père Lathuile Restaurant' (1880); 'Portrait of Rochefort' (1881); and the 'Bar des Folies Bergère' (1882).

"This work of Manet," writes a French critic, "so much discussed and produced under such tormenting conditions, owes its importance beyond all else to its power and frankness." Ten years of developing the first manner, tragically limited by the war of 1870; 13 years of developing the second evolution, parallel with the efforts of the Impressionists. The period from 1860 to 1870 is logically connected with Hals and Goya; from 1870 to 1883 (when he died) the artist's work is complicated by the study of light. He had all the pictorial gifts which make the glory of the masters — full, true, broad composition; coloring of great power; blacks and greys, which cannot be found often elsewhere than in Velasquez and Goya; and a profound knowledge of values. He tried his hand at everything: portraits, landscapes, seascapes, scenes of modern life, still life and under each in turn served his ardent creative brush. His pictures will always remain documents of the greatest importance on the society, the manners and customs of the Second Empire. A beautiful painter is what he was before everything else. It is almost inconceivable that the juries of the Salons failed to understand him. They waxed indignant over his subjects which offer only a restricted interest and they did not see the altogether classic quality of this technique without self-glorification, without tricks, without bitumen; of this vibrating color; of this rich paint; of this passionate design so suitable for expressing movement and gestures true to life; of this simple composition where the whole picture is based upon two or three values with the straightforwardness one admires in Rubens, Jordaens and Hals. Manet occupies an important place in the French School. He is its most original painter of the second half of the 19th century, the one who has really created a great movement. His work, the fecundity of which is astonishing, is unequalled.

MANETHO, or **MANETHO SEBENNYTA,** Egyptian historian: native of Sebennytus, in the Delta, and of the priestly order. He is believed to have lived in the reigns of Ptolemy I and II and to have written in the reign of Ptolemy I (323–285 B.C.), or of Ptolemy II (285–247 B.C.). According to some he was priest of Diospolis or Heliopolis; others contend that he was high-priest of Alexandria. His name has been interpreted variously as "Beloved of Thoth" or "Beloved of Neith." Scarcely anything is known of the history of Manetho himself, and he is renowned chiefly for his Egyptian annals. On the occasion of Ptolemy I dreaming of the god Serapis at Sinope, Manetho was consulted by the monarch, and in conjunction with Timotheus of Athens, interpreter of the Eleusinian mysteries, declared the statue of Serapis, brought by orders of the king from Sinope, to be that of the god Serapis or Pluto; whereupon the god had a temple and his worship inaugurated at Alexandria. The fame of Manetho was much increased by his writing in the Greek language, and so being enabled to communicate from Egyptian sources a more correct knowledge of the history of his native country than the Greek writers who had preceded him. Of this history, only extracts given by Josephus in his work against Apion, and an epitome by Eusebius and other ecclesiastical writers, remain. It appears to have been written in a compendious annalistic style of narrative, resembling the accounts given by Herodotus. The work of Manetho was in three books, the first began with the mythic reigns of gods and kings and ended with the 11th dynasty of mortals; the second continued the history from the 12th to the 19th dynasty; the third from the 20th to the 30th dynasty, when Egypt fell under the dominion of Alexander the Great. The reigns of the gods are given as amounting to 24,900 years, and the epoch of Menes, founder of the monarchy, commenced 3,555 years before Alexander (332 B.C.). The difficulties attending the

conciliation of this chronology with the nchronestic history of the Hebrews, Greeks d other nations, have given rise to numerous eculations and chronological systems since the vival of learning. The accession of newer d better information from the original urces of Egyptian monuments, papyri and her documents has considerably enhanced the neral value of the history of Manetho, which, ior to their discovery, had fallen into dis-edit. But the restoration of the history of anetho, notwithstanding all these resources d the positive epoch of the monarchy, are still be sought, though certain dynasties, in the cond and third books of his works, can be conciled with monumental evidence. Besides e true work of Manetho above cited, another ork, 'Sothis,' or the 'Dogstar' (in allusion to e cycle of heliacal rising of that star of 1461 ars) dedicated to Sebastos or Augustus, the le of the Roman emperors, has been handed wn; but there is considerable support for e opinion that it is spurious, and was added the epitomizers; and another work, called e 'Old Chronicle,' in which the history was ranged according to cycles, was compiled by em. Besides the history, Manetho wrote Ōn Physikōn Epitome,' treating on the origin gods and the world and the laws of morality; d another work on the preparation of the cred *kyphi*, a kind of frankincense. The tronomical work called 'Apotelesmata' is a urious production of the 5th century after rist. Consult Boekh, 'Manetho' (Berlin 45); Bunsen, 'Egypt's Place in Universal His-ry' (London 1848–67); Müller, C., 'His-rici Græci Minores' (2 vols., Leipzig 1870–).

MANEY, George, American soldier and plomat: b. Franklin, Tenn., 24 Aug. 1826; d. ashington, D. C., 9 Feb. 1901. He was edu-ted at the University of Nashville, fought in e Mexican War (1846–47), in 1849 was ad-itted to the bar and in 1849–61 practised law. n 1 May 1861 he became colonel of the First ennessee Infantry, and at Shiloh (6–7 April 62) he commanded first his regiment and ter the 2d brigade of the 2d division. Pro-oted brigadier-general for his conduct at hiloh, he commanded the 3d brigade of heatham's division in Bragg's army at Mur-reesboro (31 Dec.–3 Jan. 1863) and Chicka-auga (19–20 Sept. 1863), subsequently was ppointed to the command of Cheatham's di-sion and participated in the battle of Atlanta 22 July 1864). In 1876 he was nominated by ie Republican party for the governorship of ennessee, but before the election retired from ie contest. He was Minister to Colombia in 81–83, and to Paraguay and Uruguay in 1889–3. In 1884 and 1888 he was a delegate to the epublican National conventions of those years. n 1868–77 he was also president of the Ten-essee and Pacific Railway.

MANFRED, king of Naples and Sicily, 258–66: b. about 1231; d. 26 Feb. 1266. He as a natural son of the Emperor Frederick I, on whose death, in 1250, he became Prince of arentum, and acted as regent in Italy in the bsence of Conrad IV, his half-brother. After ie death of Conrad he was regent of the ingdom during the minority of his nephew onradin. At the instigation of Pope Alex-ander IV a crusade was preached against him, and Manfred was temporarily driven from his kingdom, which, however, he soon recovered, and on the rumored death of Conradin had himself crowned king of Palermo, 10 Aug. 1258. The Pope at once excommunicated him and his followers, but Manfred marched into the papal territory and compelled acknowledgment as master of Tuscany. Through matrimonial alliances for himself and his daughter he sought to increase his power, and his administration of the government was efficient, benign and for a time prosperous. But the excommunication was renewed by Pope Urban IV, who also bestowed his kingdom on Charles I of Anjou, and a war ensued in which Manfred was finally defeated and killed at Benevento. After his death imprisonment and extreme cruelty were visited upon his widow and children.

MANFRED. Lord Byron's powerful and imaginative «witch-drama,» 'Manfred' (1817), was composed under the spell of the awe-inspiring scenery of the Alps, which Byron had visited in 1816 on the tour through Germany and Switzerland recorded in the third canto of 'Childe Harold.' The hero is a sort of combination of Faust and of the Byronic type portrayed in the earlier verse tales, a lofty and defiant spirit, dwelling alone in a dark castle among the higher Alps, haunted by remorse for an act the nature of which we are left to guess. Seeking to interview the spirit of the dead Astarte, the victim of his crime, and to obtain her forgiveness, he calls up the spirits over whom he has control and at length resorts to the abode of the evil principle itself. The ghost is evoked, but returns an ambiguous answer to his question. On the morrow Manfred expires, after resisting a summons to repent from the old abbot of Saint Maurice and defying the demons who have come to possess his soul. Some biographers have seen in the poem a reflection of its author's relation with his half-sister, Aurora Leigh. In any case Byron has made his hero in his own image, infusing into him the characteristic Byronic spirit of proud rebellion and passionate despair. In style the poet aims at and partly succeeds in achieving an imaginative grandeur commensurate with his superhuman theme. 'Manfred' attracted the favorable notice of Goethe, to whose 'Faust,' translated in his presence by Monk Lewis in 1816, Byron is indebted for some of the essential elements in his drama. Consult 'The Works of Lord Byron' (edited by R. H. Prothero); and 'Cambridge History of English Literature' (Vol. XII).

JAMES H. HANFORD.

MANGABEY, măng'gą-bā, one of the odd West African monkeys of the genus *Cercocebus*, nearly related to the guenons and to the macaques. They are distinguished by the whiteness of the eyelids and the backward growth of the hair on the crown of the head. Some of the species are well known, especially the sooty mangabey (*C. fuliginosus*) which always carries its long tail turned over its back. There are three or four species and they make docile pets.

MANGALDAN, män-gäl-dän', Philippines, a pueblo of the province of Pangasinán, Luzon, situated 12 miles northeast of Lingayén, the

provincial capital. It is on the coast road and is the meeting point of several roads extending to towns in the interior, and is on the route of the railroad from Dagupan to Manila. Pop. 15,800.

MANGALORE, măng-ga-lōr', India, a seaport town, on the Malabar coast, capital of the district of South Kanara, Madras presidency. It is clean and well built, surrounded by groves of coconut palms and stands on the edge of a fine salt-water lake or back-water formed at the mouths of two rivers. The port will not admit of vessels drawing more than 10 feet of water, except in spring tides; but there is good anchorage off the mouth of the river, in five to seven fathoms. Tile-making is an important industry. The exports are principally coffee, rice, sandal-wood, cassia and turmeric; the imports sugar, salt and piece-goods. There is a Roman Catholic college, and the Basel Lutheran mission in India has its headquarters here. The Roman Catholics have a bishop and several churches, a considerable number of the natives belonging to this faith. It was captured by the Portuguese in 1596 A.D., and by the English in 1668, finally falling into British possession in 1799. Pop. about 53,000.

MANGANESE, măn-ga-nēs', a metallic element which is widely distributed in nature, though it never occurs except in combination with other elements. The dioxide was believed to be a compound of iron until 1774, when Scheele proved it to be a compound of a previously unknown metal; and in the same year Gahn prepared the element in its metallic form. It was first called "magnesium," from the fact that it was prepared from a compound then called "magnesia nigra" (and now known as manganese peroxide or dioxide); but in 1808 the name was arbitrarily changed to "manganese," by Buttmann.

Manganese may be prepared in the metallic form by reducing any of its oxides with carbon at a white heat, and this is the method followed commercially. For experimental purposes, however, it is easier to obtain it by reducing the chloride with metallic sodium or magnesium. The physical properties of manganese vary somewhat according to the precise way in which the metal is obtained. Its melting-point may be taken as 3500° F., its specific gravity as 7.4 and its specific heat is 0.122. It is a gray, hard, brittle, lustrous metal, susceptible of taking a high polish, and resembling iron in most respects, both physically and chemically. It is not magnetic, however. The pure metal does not appear to be affected by dry air, but moist air oxidizes it, at least superficially. Some authorities describe it as oxidizing readily in common air, and as decomposing water with almost as great a facility as potassium; but it appears probable that the specimens from which these results were obtained contained impurities of some sort. Metallic manganese is not used in the arts, but some of its alloys with iron, aluminum and copper are valuable. It is particularly valuable in steel, its presence in small amount increasing the hardness, tenacity and elasticity of the metal. It is added to the molten steel, in the process of manufacture, in the form of an iron-manganese alloy containing from 10 to 80 per cent of the latter metal, and known in the arts as "spiegeleisen" or "ferromanganese." The "manganese" of commerce is usually not the metal itself, but a mixture of its oxides. Manganese is used in the steel industry almost entirely in the form of two alloys, ferromanganese and spiegeleisen. These are both alloys of iron, manganese and carbon. Ferromanganese may contain as much as 80 per cent of manganese, but averages in this country about 70 per cent. In spiegeleisen the percentage of manganese is much lower; the standard figure upon which the price is based is 20 per cent. The average manganese content is about 18 per cent. Both alloys are high in combined carbon, the amount of which runs up to 7 per cent. The manganese alloys are added to molten steel from the converter, or open hearth furnace, for the purpose of introducing both manganese and carbon. The manganese cleanses the steel by combining with the contained oxygen and, to some extent, with the sulphur, and then carries these impurities into the slag. The carbon is for the purpose of giving the steel the required hardness and strength. By adding larger amounts of the alloys, manganese steel is produced, which is noted for its hardness, tenacity and durability. It is much used in the wearing parts of heavy machinery. In recent years the tendency has been to use more ferromanganese and less spiegeleisen, on account of the much smaller amount of ferromanganese that it is necessary to add to the steel. Spiegeleisen usually has to be melted in a cupola furnace before using, but ferromanganese can be added direct. The latter also introduces less carbon, which sometimes is an advantage. Ferromanganese and spiegeleisen are produced by smelting a mixture of manganese ore and iron ore in an ordinary blast furnace. A high temperature is required and the amount of fuel used is much greater than in iron smelting. A considerable amount of the manganese goes into the slag. The slag from a ferromanganese furnace may contain as much as 10 per cent of manganese. A considerable tonnage of the iron manganese alloys is now produced in the electric furnace.

Chemically, manganese is a dyad. It has the symbol Mn, and an atomic weight of 55 if O=16, or 54.6 if H=1. It forms numerous oxides, the best known of which are (1) the monoxide, MnO, from which the manganous salts may be prepared, and which is itself obtained by heating manganese carbonate out of contact with the air; (2) the sesquioxide, Mn_2O_3, which exists in nature as the mineral braunite, and which is also formed when the monoxide is heated in air to a red heat; (3) the red or mangano-manganic oxide, Mn_3O_4, which corresponds to the magnetic oxide of iron, does not form salts, and exists in nature as the mineral hausmannite; (4) the black oxide, or dioxide, MnO_2, which occurs in nature as pyrolusite and varvacite, and which is largely used in the arts in the preparation of oxygen and chlorine; (5) the trioxide, MnO_3, which is difficult of preparation and very unstable; and (6) the heptoxide, Mn_2O_7, a heavy, dark green liquid, prepared by treating potassium permanganate with cold concentrated sulphuric acid. Several of these oxides also occur in a hydrated form, as minerals. Of the soluble manganous salts, the chief representatives are the sulphate and the chloride. Manganous sulphate, $MnSO_4$, is prepared by treating the dioxide with sulphuric

id, oxygen being liberated at the same time in cordance with the equation $MnO_2+H_2SO_4=$ nSO_4+O+H_2O. It crystallizes with five olecules of water, as a pink-colored salt, and used in dyeing and in medicine. The chloride, nCl_2, crystallizes with four molecules of water, id is obtained as a by-product in the manu- cture of chlorine by the action of hydrochloric id upon manganese dioxide. It is used in cal- o printing. Of the insoluble manganese salts e may specially note the sulphide and the car- onate. The sulphide, MnS, is thrown down as flesh-colored precipitate, when a soluble man- anous salt is precipitated by an alkaline sul- ide. The carbonate, $MnCO_3$, occurs native as ne mineral rhodochrosite, and it may also be btained as a white precipitate by adding an kaline carbonate to a solution of manganeous ılphate or chloride.

Two other important classes of manganese ompounds are known, in which the manganese oes not act as a base, but as an acid-forming lement. These are the manganates and per- anganates, which may be regarded as the salts r "manganic acid," H_2MnO_4, and "perman- anic acid," $HMnO_4$, respectively. The potas- um salts of these acids are by far the ost important ones. Potassium manganate, K_2MnO_4, may be prepared by melting manga- ese dioxide with caustic potash and a little po- assium chlorate, dissolving the bright green ass so obtained in a small quantity of water, nd crystallizing by evaporation in a vacuum. otassium manganate is used in laboratory perations, but it is very unstable, taking up xygen with great readiness, and depositing hy- rated dioxide of manganese. If the green solu- on containing potassium manganate be allowed o stand in the air, it absorbs oxygen, changes s color to a bright purple and deposits hy- rated manganese dioxide. The purple color is ue to the presence of potassium permanganate, $KMnO_4$, which may be obtained, by crystalliza- ion, in the form of purple prismatic crystals. otassium permanganate is a powerful oxidiz- ng agent, and is extensively used in chemistry, n the arts and in medicine, on account of the acility with which it parts with oxygen, espe- ially in the presence of organic matter. It orms the basis of "Condy's fluid," which is argely used as a disinfectant.

The chief ores of manganese are the black xide pyrolusite (MnO_2, 63.2 % Mn); psilome- ane ($MnO_2.H_2O$, 45–60 % Mn); braunite (3 Mn_2O_3. $MnSiO_3$, 69.7 % Mn); wad which is an arthy oxide (Mn 15–40 %); manganite ($Mn_2O_3.H_2O$, 62.4 % Mn); rhodochrosite ($MnCO_3$, 61.7 % MnO), and franklinite [$(Fe3nMn)O(FeMn)_2O_3$]. The ores are often ssociated with other metals, particularly with ron oxides, and with silver ores. Like residual imonite (see IRON ORES) manganese ore is usu- lly secondary, resulting from the removal of nore soluble substances during the weathering of slightly manganiferous rocks. For many ears prior to 1914 Russia was by far the great- st producer of high grade manganese ores. Most of this output came from one locality near Chiatouri, south of the Caucasus Mountains. Some engineers have estimated the total re- serves of high grade manganese ore in this one district to be upward of 100,000,000 tons, although this has been disputed. For some time before the war Russia's production averaged more than half a million tons yearly. Next in importance to Russia as sources of manganese are Brazil and India. In Brazil there was a rapid development of the industry and the production of manganese ore in 1917 was about 500,000 tons. As the war practically stopped the exportation of manganese from Russia and India, the deposits in Brazil assumed great importance, but in 1924 exports fell to 151,043 tons. The United States has never been a large producer of manganese ore. A writer in the *Mineral Industry* some years ago stated that the manganese output of the country was "insignificant because of the trifling character of the deposits." In 1914 the total production in the United States of ore containing 40 per cent or more of manganese was only 2,635 long tons. In the production of ferromanganese and spiegeleisen and in the other arts using manganese compounds it is desirable to have an ore containing at least 40 per cent of the metal. Before the late war it was almost impossible to find a steel maker willing to buy a lower grade. During the war some steel makers bought ore containing only 28 per cent manganese and were glad to get it. Most of the manganese bearing ores mined in the United States are classified as manganiferous iron ores, which may or may not contain silver and lead. In these ores the manganese is mainly valuable as a flux in smelting operations, although it can sometimes be used for making spiegeleisen. The domestic shipments of manganese containing 35 per cent and more of metallic manganese amounted in 1937 to 40,241 tons, having a value of $1,062,399. Production was lower than the 1925–29 average which was 59,312 tons but there had been a steady increase after 1933 when total production was 19,146 tons. Largest output came from Montana. The production of manganiferous iron ore containing from 10 to 35 per cent manganese in 1937 was 151,955 long tons valued at $778,840. Production of ore containing from 5 to 10 per cent manganese was 1,189,017 long tons with a value of $3,078,919. Imports of manganese in 1937 totaled 911,922 long tons, valued at $10,451,602. Largest imports were from Cuba and the Gold Coast. The domestic deposits are in many States, of which the most important are Arizona, Arkansas, California, Colorado, Georgia, Minnesota, Montana, Tennessee, Utah and Virginia. In 1910 the United States Geological Survey issued a very excellent monograph, Bulletin No. 427, entitled 'Manganese Deposits of the United States,' by Edmund Cecil Harden, giving very complete data in regards to ores, alloys, production and uses. The same author contributed a paper entitled 'Manganese Ores of Russia, India, Brazil and Chile,' to the 'Transactions of the American Institute of Mining Engineers' (Vol. LVI, p. 31). In the same volume there is an article by Joseph T. Singewald, Jr., and Benjamin Leroy Miller on 'The Manganese Ores of the Lafayette District, Minas Geraes, Brazil.' In the *Engineering and Mining Journal* (issue of 9 Feb. 1918) is a popular article by Henry V. Maxwell entitled 'Prospecting for Manganese.' See METALLURGY; STRATEGIC AND CRITICAL MINERAL SUPPLIES.

MANGANESE BRONZE, a metallic element in which the copper forming the base of the alloy is mixed with a certain proportion of ferro-manganese, and which has exceptional

qualities in the way of strength and hardness. Various qualities are manufactured, each suited for certain special purposes. One quality, in which the zinc alloyed with the treated copper is considerably in excess of the tin, is made into rods and plates, and when simply cast is said to have a tensile strength of about 24 tons per square inch. Another quality has all the characteristics of forged steel without any of its defects. Another quality is in extensive use for toothed wheels, gearing, brackets and all kinds of machinery supports. From its non-liability to corrosion it is largely employed in the manufacture of steamship propellers.

MANGANITE, native hydrated oxide of manganese, MnO (OH), or $Mn_2O_3.H_2O$. It crystallizes in the orthorhombic system, but also occurs in columnar and stalactitic forms. It is brittle, and has a hardness of 4 and a specific gravity of about 4.3. It is steel gray to iron black in color, and opaque with a submetallic lustre. It occurs in the Harz region, in Norway and Sweden and in the British Isles. In the United States it is found in the Lake Superior mining district, and in Douglas County, Colo. It also occurs in Nova Scotia and New Brunswick. Manganite is used as a source of manganese for the preparation of spiegeleisen and other alloys, and also in the manufacture of pigments and dyes.

MANGASARIAN, Mangasar Mugurditch, American author and lecturer: b. Mashgerd, Armenia, 29 Dec. 1859. He was educated at Robert College, Constantinople, 1872–76 and at Princeton Theological Seminary. He entered the Presbyterian ministry in 1882 and held a pastorate in Philadelphia 1882–85, when he resigned to become an independent preacher and lecturer. In 1900 he organized the Independent Religious Society, Rationalist, at Chicago, and was its lecturer until 1925. He is the author of 'A New Catechism' (1902); 'The Truth about Jesus' (1909); 'How the Bible was Invented' (1910), 'The Crisis of the Churches,' and numerous other works on religious topics.

MANGATAREN, män-gä-tä'rĕn, Philippines, a pueblo of the province of Pangasinán, Luzon, 18 miles south of Lingayén; it is on the Agno River road. Pop. 10,150.

MANGE, a cutaneous disease to which dogs, horses, cattle, etc., are liable. It resembles in some measure the itch in the human subject, ordinary mange being due to the presence of a burrowing parasite. Both local application and internal remedies are used in its cure. Frequent washing of the skin is essential. See ITCH.

MANGEL-WURZEL. See BEET.

MANGIN, Charles Marie Emmanuel, French general: b. 6 July 1866; d. Paris, 12 May 1925. He served from his 24th year in Tonkin and in every part of Northern Africa, and accompanied Marchand on his historic journey from the Congo to the Nile in 1898. He first came under public notice in 1911, when, as military instructor to the Moroccan forces of Sultan Mulai Hafid, he defended Fez against the rebellious Berber tribes. In August 1912 he led a flying column of 4,000 men from Fez to Marakesh, effecting a dramatic rescue of nine French prisoners held by the pretender El Hiba. He received the congratulations of his government and was made a commander of the Legion of Honor. At the outbreak of the European War he was given a brigade command in the 5th Army, which took the shock of the first German onset at Charleroi. At the Marne he led a division and was heavily engaged at the battle of the Aisne. After participating in various other battles he arrived at Verdun with his division in March 1916. Here he led his men to the recapture of La Caillette Wood and (22 May) to the brilliant but shortlived reconquest of Douaumont. He was placed in command of the new 3d Colonial Corps in June and given charge of the crucial sector on the right bank of the Meuse. In October his command recaptured Douaumont and also Fort Vaux, with nearly 5,000 prisoners. He deprived the Germans of a wide sweep of territory around Verdun in December, and in the spring, conducted a big offensive between Soissons and Rheims, which was suddenly stopped. Mangin was relieved of his command and relegated to an obscure post through a cabinet crisis. With the accession of Clemenceau, Mangin was sent back to the field. In the summer of 1918 he commanded the French-American forces operating between the Aisne and the Marne. In 1919 he commanded the French army of occupation, and in 1921 was sent to South America.

MANGLE, a machine for smoothing linen and cotton goods. See LAUNDRY MACHINERY.

MANGO, măn'gō, a genus of trees (*Mangifera*) of the family *Anacardiaceæ*. The 30 species are natives of southeastern Asia, where some of them have been distributed by man throughout the tropics of both hemispheres. The wood of various species is used for boat and canoe making, for house building and for boxes. It is gray, rather soft and easily worked. The trees are valued also for shade, being of large size and attractive form, and very leafy, the leaves large, leathery and evergreen. It is for their fruits, however, that they are most esteemed. These are widely used for human food, especially in the East, either ripe, in which condition they are eaten raw, with or without wine, sugar and spices, or unripe as preserves, jellies or pickles. They are also used for making wine and glucose. The finer varieties are considered equal to the choicest pineapples and even to the mangosteen.

The most commonly planted and most widely distributed species is the common mango (*M. indica*), a native of India. It often exceeds 40 feet in height, bears terminal panicles of rather small pinkish or yellow flowers, followed by smooth kidney-shaped yellow or reddish fruits which often weigh more than half a pound. Each fruit contains one large flattened seed, almost as long and often nearly as wide as the fruit, but flattened like the seed of a melon. The kernel is often roasted and eaten like chestnuts. The pulp of the fruit is soft, luscious in the finer varieties but very fibrous in the inferior sorts. These have a more or less pronounced flavor, suggestive of turpentine, which is characteristic of all parts of the tree. Since 1782, when the mango was introduced into Jamaica with a lot of other plants taken from a French vessel captured on its way to Haiti, the fruit has spread throughout the West Indies and southern Florida. In Florida, however, the

freeze of 1886 destroyed all trees except those in the extreme southern part, where the mango is now confined. The market, which seems to be growing but is somewhat limited because of the prevailing ignorance regarding the fruit, is supplied mainly from the West Indies. California supplies little more than its home markets. The trees do best upon well-drained sandy land, and should be well supplied with potassic manures. They quickly fail to bear upon wet soils. They may be propagated by grafting, but since a large proportion of the varieties reproduce practically without change by seed this method is widely employed. Grafted Indian varieties were first introduced in Florida in 1889.

Several other species of mangoes are cultivated. For instance, the horse mango (*M. foetida*), a native of Malacca, is cultivated in India, and *M. sylvatica,* whose fruits are dried and used like prunes.

MANGO BIRD. Several birds are called mango birds in various parts of the world because they frequent mango trees. The East Indian one is an oriole (*Oriolus kundoo*); the West Indian one, so called in Jamaica, is a hummingbird (*Lampornis violacauda*), which may occasionally visit Florida.

MANGO FISH, one of the threadfins, a small perchlike seafish (*Polynemus plebijus*) which is numerous along Oriental coasts, and approaches the shore and is caught at the time when mangoes ripen. The same name is sometimes given to a relative in the West Indies (*Polydactylus virginicus*), called barbudo in the Cuban markets.

MANGOSTEEN, a tree (*Garcinia mangostana*) of the family Guttiferae, native of the East Indies, sometimes cultivated in tropical America. It is one of the best-known fruits of the East Indies. The fruits are about the size of a mandarin orange and of similar shape, with a thick, red-purple rind; the flesh is snow-white or cream-colored, so delicate that it melts in the mouth, and of delicious flavor. So far, attempts to grow the tree in Florida have been unsuccessful.

MANGROVE, măn'grōv, a genus of trees and shrubs (*Rhizophora*) of the family Rhizophoraceae. The species, of which there are less than half a dozen, are all natives of the tropics, where they inhabit tidal marshes and the mouths of streams. They are remarkable for their aerial roots, which extend from the branches to the mud and then become trunks for the extension of the trees, which gradually advance even to low tidal mark; and also for their peculiar method of seed germination, the seeds sprouting while still attached to the twigs. The wood, which in some species is close-grained and durable, is used for fuel and to a small extent for other purposes; the bark, which is rich in tannic acid, is employed in tanning; the fruit of some species is edible and is used for wine making. The best-known species is *R. mangle.*

MANGROVE SNAPPER, the gray snapper, an excellent food-fish, which abounds among the mangroves along the coasts of Florida and the Bahamas, and thence to Brazil. See also SNAPPER.

MANGUIANES, măn-gē-änz', the natives of the interior of Mindoro, Romblon and Tablas (qq.v.), Philippines; they are divided into four branches, one of which is of Negrito blood, another is Mongoloid and the other two are of the Malayan race. There are several tribes, including the Bangot, and the Buquil. The term is also used in the island of Palawan to designate all wild natives of unknown origin.

MANGUM, Willie Person, American legislator: b. Orange County, N. C., May 10, 1792; d. Red Mountain, N. C., Sept. 7, 1861. He was graduated from the University of North Carolina in 1815, was admitted to the bar in 1817, in 1818 was a member from Orange County of the lower house of the state legislature, and in 1819 became a judge of the Superior Court. From Dec. 1, 1823 to March 18, 1826 he was a Whig representative in the 18th and 19th Congresses; but this post he resigned, and again he was elected a judge of the Superior Court. He retired from the court in 1826, but filled the office a third time in 1828–1830. He was a United States senator from Dec. 5, 1831 to 1836, when he resigned, and from Dec. 9, 1840 to March 3, 1853; and in 1842–1845 was president *pro tempore* of the Senate. Throughout nearly his entire term of service in Congress he was a leader of the Whigs; and in 1837 he received the 11 electoral votes from South Carolina for the presidency of the United States.

MANGUM, city, Oklahoma, and Greer County seat, altitude 1,600 feet, on the Rock Island Railroad and the Missouri, Kansas, and Texas Railroad, 150 miles southwest of Oklahoma City. It processes cotton, and manufactures brick, tile, and food products. It has commission government, with a city manager. Mangum was proclaimed a city of the first class in 1906, by Territorial Governor Frantz. The place was named for A. S. Mangum, who held a grant of land on the site. Pop. (1940) 4,193; (1950) 4,271.

MANHATTAN, city, Kansas, and Riley County seat, altitude 1,012 feet, at the confluence of the Kansas and the Big Blue rivers, and on the Union Pacific and the Rock Island railroads, 51 miles west of Topeka. There is a municipal airport. The city is a trading center and distribution point for a rich farming region, and has small local industries. Much damage was caused by the flood of July 1951.

It is a college town, the seat of Kansas State College of Agriculture and Applied Science (q.v.). There is a public library (Carnegie) and the college library. The city has a city manager plan of government. Pop. (1940) 11,659; (1950) 19,056.

MANHATTAN, măn-hăt"n, one of the five boroughs comprising the city of New York. See NEW YORK CITY.

MANHATTAN BEACH, city, California, in Los Angeles County, situated 20 miles southwest of Los Angeles on the Pacific Ocean. It is a residential community, incorporated in 1912, and has a beautiful beach which makes it popular as a resort.

Government is by a city manager. Pop. (1950) 17,330.

MANHATTAN COLLEGE, an institution in Manhattan borough of New York City directed by the Christian Brothers. Founded as the Academy of the Holy Name (1849), it was incorporated as Manhattan College, 1853. It awards arts and science degrees. Enrollment (1951) 2,313.

MANHATTAN TRANSFER, a novel by John Dos Passos published in 1925. The novel is a study of New York life up to and during the Prohibition era. Using a broken plot pattern, the author treats the lives of many characters and their reactions to an industrial, urban environment. The characters include Elaine Oglethorpe, an actress who marries three times without finding surcease from boredom; Jimmy Herf, an idealistic newspaperman who cannot find a satisfactory place for his ideals in society; George Baldwin, a lawyer who is the supreme suitor of success and the main chance. The only ultimately contented individuals portrayed are the non-intellectual types, small politicians, bootleggers, an occasional businessman, who mold themselves into acceptable social patterns.

Primarily a study of social problems, the novel clearly shows the camera-eye technique which typifies the writing of Dos Passos. The novel is like a surgical cross-section in which the nerves and arteries of the subject are displayed with a modicum of protective covering. There is a wealth of naturalistic detail which gives a terrible reality to the pains and small triumphs of the characters.

MANHEIM, măn'hīm, borough, Pennsylvania, in Lancaster County; altitude 399 feet, on the Reading Railroad, 10 miles northwest of Lancaster. Manufactures include asbestos, rubber and metal products, and clothing.

The borough was settled c.1716; and laid out in 1760 by H. W. Stiegel, who produced here what is believed to have been the first flint glass in America. Government is by a mayor and council. Pop. (1940) 3,831; (1950) 4,246.

MANI, mă-nē', the indigenous peanut of Cuba, Peru and Chile. In Mexico and Central America it is called *cacahuate.*

MANICALAND, mă-nē'kă-lănd, South Africa, a former territory of southern Rhodesia, situated on the border of Portuguese East Africa, east of Mashonaland, between the parallels of 18° and 21° S., and the meridians of 30° 30′ and 33° E. It is now part of Manica and Sofala provinces. See RHODESIA.

MANICHAEANS, măn-ĭ-kē'ănz, the followers of Manes, Mani or Manichaeus, as he is variously styled, a Gnostic teacher, whose opinions prevailed in western Asia and eastern Europe during the 4th and 5th centuries of our era. Manichaeism is generally considered to be the Persian type of gnosis, as it is distinguished by Zoroastrian dualism, and other features of that system. Hebrew elements of religion and Buddhistic doctrines were also found in Manichaeism, which appears to have been an eclectic jumble of wild fancies, among which the soberest and strongest dogmas of the Christian creed were sometimes seen to be embedded. The dualism of Manes was conceived of by him as manifested in two contiguous realms of light and darkness, good and evil. The kingdom of light included a heaven and an earth, the latter guarded by æons, or good spirits, and presided over by a spirit of goodness. From the kingdom of darkness sprang Satan and his evil angels. This confusion and mixture, in the universe, of light and darkness, originated before the creation of man, a creature of light and darkness combined in proportions varying in each individual. The human race is finally to be purged of darkness and sin. Jesus Christ was looked upon as dual in nature; there was Jesus who did not and could not suffer, *Jesus impatibilis,* a sort of phantom or immaterial personage, and *Jesus patibilis,* who suffered death upon the cross.

The practical side of Manichaeism appears in the condemnation of marriage, or sexual indulgence of any sort, and the ascetic purification of hands, mouth or bosom, which kept the initiated from eating animal food, contracting ceremonial defilement through the touch and indulging the flame of human passion in the heart. There were two classes of disciples, the initiated, or *perfecti,* and the *auditores,* hearers, or novices. St. Augustine of Hippo was, for nine years before his conversion to Christianity, a Manichaean hearer. These hearers lived a much less strict life than the *perfecti,* and constituted by far the majority of the Manichaean sect. The clergy of this sect were organized after the model of the Christian ministry; their rite of baptism was performed with oil instead of water; they had also a eucharistic meal among their public ceremonies. The system spread rapidly through the Roman Empire and competed with Neo-Platonism in hostility to the church. Diocletian persecuted the Manichaeans, and under Justinian the profession of Manichaeism was a capital crime. The system, however, flourished in Asia beyond the 10th century and has reappeared in some shape or other, and under different names at different times in subsequent periods of European history.

MANIFEST, *in law,* a written instrument delivered by the captain of a ship to the customs officials setting forth in detail the goods shipped, the consignors, etc.

MANIFOLDS, Theory of. See ASSEMBLAGES, GENERAL THEORY OF.

MANIGAULT, Arthur Middleton, American soldier: b. Charleston, S. C., Oct. 26, 1824; d. South Island, Georgetown County, Aug. 16, 1886. In 1846 he was elected first lieutenant of the Charleston company in the "Palmetto" regiment for the Mexican War, throughout which he served. In June 1861 he was elected colonel of the 10th regiment, South Carolina infantry, and in 1861–1862 was in command of the 1st South Carolina military district. From the early part of 1862 he served in the army of the West successively under Bragg, Johnston and Hood, in 1862 was placed in command of a brigade, and in 1863 made brigadier general. At Chickamauga he distinguished himself by his repeated assaults, and in the retreat before Sherman's invasion he did some vigorous fighting. After the war he was elected by the Democrats adjutant general of South Carolina, serving until his death.

MANILA, mă-nĭl'ă, city, Philippine Islands, and chief port; on the island of Luzon, in altitude 14° 58′ 31″ North; longitude 120° 58′ 8″ East; on

nila Bay, at the mouth of the Pasig River; minus of the Manila Railroad. The city has n called the «Pearl of the Orient.» It lies st of a line drawn from Japan on the north the middle of Australia on the south; with Malay Archipelago between it and Australia, l the continental mainland of Asia, at Hong ng, 700 miles to the northwest.

Transportation.—Manila, in normal times, connected with ports in all parts of the world steamship lines, freight and passenger; and further connection with the United States clipper air service, and with cities of Asia l Europe by airlines via Singapore and Hong ng. Manila Bay, with an area of 770 square les and a shore line of 120 miles, is one of best harbors in the Far East. The modern t area affords deep, wide channels, abundant horage space, modern piers and warehouses, h mechanical cargo-handling equipment, and the facilities of a natural harbor with the st of engineering improvement.

Inter-island transportation is provided by at and airlines; intra-island, by railroad and s. The Manila Railroad Company operates railroads, which are owned by the Philippine vernment. Within the city of Manila pas- ger carriage is by bus, trackless trolley, street , taxicab—and native vehicles, horse drawn.

Industries and Trade.—Prominent among nila's industrial establishments are sugar cen- ls, rope and cordage factories, cigarette and ar factories, coconut desiccating plants, and conut oil mills. Other factories in the city ke shoes, soap, rattan furniture, mats, and er hats. There are a number of canneries, d many food packing companies have head- arters here. An important and characteristic lustry is hand embroidery.

Manila is the islands' center of trade. To d from it, via the other Philippine ports, sses the bulk of the islands' exports and ports, as well as of domestic, inter-island ade. More and more in Manila the old house- ld industries tend to become mechanized, and ere is increasing call by small factories for wer service.

Descriptive.—The old city, the original nila, a medieval walled town known as Intra- uros, lies on the south side, or left bank, of e Pasig River. Here, within the ancient walls, e narrow streets, and houses of old Spanish pe; here too are old churches and convents, d the University of Santo Tomás. This insti- tion, founded by Dominican missionaries in 05 and designated as a pontifical university 1645, occupies a building that dates from 11. Under the walls enclosing the old town ere, in the era of Spanish rule, powder maga- nes and dungeons.

North of the river is the Binondo section. st off the bridge is Plaza Moraga, from which ns a busy street called the Escolta; upon ese the business section centers. Near by is lle Rosario, with Chinese bazaars. Tondo, to e north, is a semislum district and is the ty's most densely populated area. On higher round are residential neighborhoods, and Mala- ñan, residence of the President of the common- ealth; formerly the governor general's palace.

South of the walled city is the Ermita sec- on, and adjacent to it, along the bay shore, is e Luneta, a park from which leads Dewey oulevard, lined with fine residences. Street names collocate, piquantly, the native, Spanish, and American phases and aspects of the city's history: Taft Avenue, Plaza McKinley, Dewey Boulevard; and the Avenues Rizal, Isaac Peral, San Luis.

Education and Culture.—Since 1901 education in the Philippines has developed extensively. Where then Americans organized public school systems, Filipinos now administer them. Enrolment in the elementary schools of the islands is large. Many boys and girls go on to the high schools; many avail themselves of the excellent opportunities for vocational and professional training. In Manila there is an efficient and adequate public school system, organized and administered on American lines. Provision is made for adult education, and for the training of teachers; an office of adult education was opened in 1936. The percentage of illiteracy was placed at 80.7 in 1939; the average for the Commonwealth was 48.8.

Institutions of higher learning in Manila include the Philippine Women's University; the Far Eastern University; the Centro Escolar University; the National University, the University of Manila, the government-operated University of the Philippines, and Santo Tomás, mentioned above under *Descriptive*.

In Spanish times education and culture were guided principally by the Church. There was no newspaper published in Manila until 1822, and public schools were not authorized until 1863; now, in Manila, there is a demand for American magazines and books apparently far in excess of the requirements of the white residents and visitors; swift development of a native middle class, educated in the English language, is the explanation. Manila itself is the place of publication of a large number of periodicals printed in English, Spanish, or Tagalog: dailies and weeklies, monthly magazines and quarterlies, in various fields—political, educational, agricultural, commercial, scientific, religious, and literary.

Manila has excellent facilities for entertainment and recreation: theaters, parks and playgrounds, athletic fields, and many clubs. The Philippine Exposition, held annually, in February, combines sports, pageants, educational and cultural exhibits.

Libraries, Museums, Memorials.—Manila has many fine libraries and museums. The National Philippine Library and the Philippine Museum have collections of the greatest value. The University of Santo Tomás maintains both a library and a museum. The Bureau of Science houses a reference library and collections of photographs and of Philippine flora and fauna. The aquarium, near one of the gates of the old wall, exhibits tanks containing specimens of marine life from Philippine waters. Another interesting seat of science is the observatory, founded by the Jesuit Fathers in 1865, now maintained with government co-operation, and operated by members of the society. It has gained worldwide recognition through its studies of earthquakes and typhoons. In the Luneta stands a statue of José Rizal (q.v.); a further memorial to him is the Rizal Stadium. In the old city hall (Ayuntamiento) is a statue of Juan Sebastian del Cano (q.v.), Spanish circumnavigator. In this building are kept valuable carvings and paintings, and archives containing documents of great antiquity.

Buildings.—The architecture of Manila is diversified. In the native section are flimsy structures, shacks thatched with nipa palm leaves. In the walled town are Spanish houses with barred windows, balconies overhanging the street, tiled roofs, and family shrines set into the walls; there are ancient Catholic churches, and palaces built for the Spanish rulers. And in the modern city there are theaters and hotels of modern American pattern; fine residences and club houses; and the public buildings, of which the government buildings and the post office are the most notable.

Churches and Charities.—Manila's oldest churches are Catholic; the Roman Catholic Cathedral, in the walled city, was dedicated in 1581. The Church of St. Augustine, also in Intramuros, is still older. The Episcopal Cathedral of St. Mary and St. John (1907) is surrounded by a grove of palms, acacias, and flame trees. Among the many other places of worship are the Cathedral of Tondo; First Baptist; First Church of Christ Scientist; Hongwanji (Japanese Buddhist); and the Methodist and Presbyterian missions.

The Philippine General Hospital and the Quezon Institute are important institutions; the latter specializes in tubercular cases. The Hospicio de San José, refuge for foundlings, stands on an island in the Pasig River. Other hospitals are St. Luke's (1907); Santiago, St. Paul's, and San Juan de Dios. Bilibid Prison is not only the largest but the best organized penal institution in the Far East, designed to rehabilitate its inmates, to whom it gives training in the trades.

History.—Fifty years after Magellan claimed the Philippines for Spain, that is to say in 1571, Spanish government was organized in the native city of Manila. Building of the defensive wall and moat was begun in 1790. In the 18th century the city was attacked by the Dutch and by the British, in their wars with Spain; the British held it from October 1762, to February 1763. From 1763 to 1898 it was held by the Spaniards; in 1896 a Filipino insurrection broke out, but failed to capture the capital. After the smashing of the Spanish fleet by Dewey in the Battle of Manila Bay (see UNITED STATES—*War with Spain*), Manila surrendered (13 Aug. 1898). During the ensuing Filipino insurrection against American rule, led by Emilio Aguinaldo (q.v.), an attempt was made to destroy the city. After a period of military government, administered from Manila, civil government was established, with headquarters in the city (1901); and when the commonwealth was inaugurated (15 Nov. 1935), Manila retained its established status in the Philippine regime. With the outbreak of war in Europe in 1939, the city's standing as capital of a possession anticipating severance added to its economic difficulties the problems of defense. When hostilities with Japan began on 7 Dec. 1941, the city found itself one of the three great bastions for the defense of the Far East—Hong Kong and Singapore being the other two. The city was repeatedly bombed in the early weeks of the war.

Government.—Manila is the seat of the commonwealth government. The city government is headed by a mayor, and the municipal legislative body is the council. The commonwealth pays a percentage of the cost of the city's government; the remainder is raised by city taxation. Manila was incorporated as a city in 1901.

Population.—The 1939 census of the Philippines showed that Manila had a population of 623,492. In 1936 the population, as of 1 July, was officially estimated as 355,485.

MANILA, University of, founded in 1585 by Philip II of Spain. Later branches or affiliated schools were founded in different parts of the island. A seminary for the sons of Spanish nobles was opened in 1601, and 10 years later departments were added for the sons of those not belonging to the nobility and for the natives. The university was reorganized in 1857, and again after the American occupation. The departments are science, classics, law, medicine, theology, philosophy, engineering, pharmacy, arts and music. The usual degrees are granted. In 1926 there were about 1,000 students in attendance.

MANILA BAY, the largest bay in the Philippine Archipelago, indenting the western central coast of the island of Luzon. Its greatest dimensions are from the minor bay of Pampanga in the northwest to Point Kalumpan on the south, about 38 miles; from the delta of the Grande de la Pampanga River southwest to Corregidor Island is 31 miles; circumference 120 miles. The entrance between Point Kalumpan and Corregidor is about seven miles in width; that between Corregidor and Mariveles about two miles. There are lighthouses on either side of the larger entrance. The bay is surrounded by five provinces, and receives the waters of many rivers, including the Grande de la Pampanga, with its large delta, and the Pasig at Manila, which communicates with Laguna Bay, to the southeast, and has been dredged for navigation. The lands on both sides of the bay at the entrance are high and covered with vegetation, but the shores at the head of the bay are low and marshy, intersected by numerous small rivers, estuaries and tidal lakes. It is one of the finest harbors in the East, being free of obstructions to navigation, and affording excellent anchorage. But the water is so rough at times that it was necessary to construct large breakwaters to protect the shipping. Point Luzon is at the mouth. Submarine telegraphs are laid in the bay which run to San Francisco, to Hong Kong and to Iloilo. Manila, the capital of the archipelago, and Cavite, the United States naval headquarters in the Philippines, are on its shores; an artificial port is being constructed at Manila. In this bay Admiral Dewey won a victory over the Spanish fleet 1 May 1898.

MANILA BAY, Battle of. See UNITED STATES—*War With Spain.*

MANILA HEMP, or **ABACA,** *Musa textilis.* This species belongs to the plantain or banana family, the commercial fiber being derived from the stalk or trunk of the wild plantain of the Philippine Islands, and is classed as a structural fiber. The strongest and best of our hard cordage fibers, it is employed in the United States for standard binder twine and for all sizes of rope from the smallest dimensions to hawsers and cables. The old rope and the waste are employed as paper stock. The fiber is creamy white to reddish white, lustrous, easily separated, stiff and resistant, while its

htness makes it advantageous for employ-ent in cordage for the rigging and running pes of ships. Structurally the bundles of bres are very large, but easily separated into bres of even diameter; the walls of the cells e of uniform thickness, growing slender to-ard the ends gradually and regularly. In eakage tests for textile strength, with Eng-h hemp — made by the British government — anila stood a strain of 4,669 pounds against 885 pounds for hemp, ropes three and one-uarter inches in circumference and two thoms long being used in each test. In the hilippine Islands the finer grades of the fibre re extensively used for fabric manufacture, the roduct being worn by the natives of both sexes roughout the archipelago. Mixed with cotton durable fabric is produced well adapted to the imatic conditions of the islands. According o a recent report of the Philippine Bureau of griculture, the manila hemp plant was intro-uced into India in 1859 and the Andaman slands in 1873. The plant is also said to be ound in Borneo and Java, and attempts have een made to introduce it into other countries. t remains a fact, however, that the commercial bre is produced only in the Philippines. The ulture has been attempted without success in ne West Indies, and seed was imported for trial n Florida only a few years ago; it was planted ut it failed to germinate. Several species of anana yielding fair fibre are successfully culti-ated throughout tropical and sub-tropical merica, and in many other portions of the orld. Banana fibre bears no comparison, how-ver, with the Manila hemp of commerce, al-hough the fibre of *Musa basjoo* is produced ommercially in Japan where it is employed for ndergarments for summer wear, as well as for ight dresses for the higher classes of Japanese.

Manila hemp first attracted attention com-nercially early in the last century, and was im-orted into Salem, and Boston, Mass., about 1824; samples of the fibre, however, were rought to this country by naval officers as arly as 1820. The production of the textile ad reached about 8,000 tons in 1840, 30,000 tons n 1860 and 50,000 tons in 1880. In 1900 the roduction was nearly 90,000 tons. It now averages about 100,000 tons. The United States took in 1930, 64,052 tons, valued at $8,844,284 as compared with 72,190 tons, valued at $13,-496,000 imported in 1929. These figures relate to unmanufactured hemp only.

Regarding the specific localities of produc-tion and details of cultivation, preparation, etc., he student is referred to Bulletin of the Royal Gardens Kew (August 1894), to a Descriptive Catalogue of Useful Fibre Plants of the World (Washington 1897), and to the latest issues of the *Farmer's Bulletin* published by the Philip-pine Bureau of Agriculture, Manila.

The extraction of the fibre is a simple propo-sition. The *abaca* is cut near the roots when the plant is two to four years old, and just be-fore blossoming; if cut earlier the fibre is finer but shorter. After striking off the leaves the trunk or stem is slit from end to end, and the sheathing layers of cellular matter, which form the petioles of the leaves, are separated, dried a day or two and then cut into strips three inches wide, and finally scraped until the fibre has been cleaned of all extraneous matters, soft cellular tissue, etc. The bundles of wet fibre are shaken into filaments, washed, dried and sorted. This is the export fibre for cordage purposes, the fabric fibre necessitating further treatment by beating, which softens and subdivides the fila-ments. The export fibre is wrought into hanks and made into bales of about 270 pounds, when it is ready for shipment. Attempts to use ma-chinery for extracting the fibre have not been successful, partly because the machines have not been adequate, and partly on account of native prejudice. There is a great waste by the hand methods of preparation which it is thought ma-chine extension would obviate. See FIBRE; HEMP; JUTE; RAMIE; SISAL HEMP.

MANIN, mä-nēn', **Daniele,** Italian patriot: b. Venice, 13 May 1804; d. Paris, 22 Sept. 1857. He studied at the University of Padua, was ad-mitted to the doctorate of laws and practised at the bar. In politics he became the leader of the liberal class, and by 1847 had secured a solid reputation as a political economist. For anti-Austrian utterances made during that year and the next he was twice imprisoned, but while awaiting trial was set free by the populace upon arrival of news of the revolution of 1848 in Italy and France, was made President of the Republic of Saint Mark and given supreme power as head of the patriotic revolt. The Austrians were driven out, and during the siege, which began in the autumn of 1848 and lasted 12 months, Manin was at the head of the civil government, and to his counsels and patriotic spirit it was mainly owing that the Venetians maintained so long and brilliant a defense. After the capitulation Manin retired to Paris, where he maintained himself by giving lessons in Italian, and continued in various pamphlets and through the press to advocate the cause of Italian independence. Consult Martin, 'Daniel Manin and Venice in 1848–9'; Mortinengo, Ce-saresco, 'Italian Characters' (1901).

MANIOC, or **MANDIOC.** See CASSAVA.

MANIPLE, (1) one of the divisions of the ancient Roman army. It consisted of 60 rank and file, two officers called centuriones and one standard-bearer called vexillarius. (2) In the Roman Catholic ritual a sacred vestment at-tached to the left arm, to leave the right at lib-erty for ministering. See COSTUME, ECCLESIAS-TICAL.

MANIPUR, măn-ĭ-poor', northeast India, a thinly populated native state now more fre-quently called Assam State, which is confusing because there is Assam province (q.v.). It con-sists principally of an extensive valley situated in the heart of the mountainous country which lies between Assam, Cachar, Burma and Chitta-gong; area, 8,456 square miles. The greater part of the state is covered with forest and jun-gle, and the wild animals include the elephant, rhinoceros, tiger, leopard, bear, deer and buffalo. The people belong to the Mongolian race, and are known as Manipuris. They are governed by a rajah, at whose court resides a British po-litical agent under the control of the chief com-missioner of Assam. The capital is Manipur, also called Implial, lying in the Namkathay on Manipur River, which is tributary to the Irra-waddy, almost 250 miles north by west of Man-dalay; pop. about 75,000. Most of the work is done by the Manipuri women, the men being lazy. The chief crop is rice. There is a special breed of ponies in the country, which are much

employed in the game of polo, the national sport of Manipur. There has been a political agent in Manipur since 1835. In 1891, in an outbreak headed by a member of the reigning family, the chief commissioner of Assam and the political agent were murdered; but the disturbance was soon put down and avenged. Pop. (1941) 512,069, composed chiefly of Hindus, Mohammedans, Christians and Buddhists.

MANIS, PANGOLIN, or **SCALY ANTEATER,** an edentate mammal, belonging to the group Squamata, coextensive with which is the family Manidae. The body and long, thick tail are covered with horny, imbricated scales. The legs are short and very strong, and the toes are armed with powerful claws, enabling the animals to burrow rapidly. These animals can roll themselves into a ball, and are then protected by their scales, and they exhibit remarkable strength in holding their bodies in this protective attitude. The scales are regarded as formed of agglutinated hairs; in the Asiatic species true hairs grow between the scales and extend beyond them. All dwell in burrows, come abroad only at night and subsist almost altogether on ants and termites, which they capture by means of their long, ropelike, sticky tongues. They have no trace of teeth; and in general structure show a close resemblance to the American anteaters. They range in size from the African *M. Gigantea,* six feet, to two and one-half feet. They are comparatively common in some rocky districts of India and China. The latest review of the family shows that it contains seven species.

MANISTEE, măn-ĭs-tē′, Mich., city and Manistee County seat, altitude 581 feet, on Lake Michigan at the mouth of the Manistee River, on the Pere Marquette and the Manistee and Northeastern railroads, and on state and federal highways; by rail, 147 miles northwest of Saginaw. It has a natural harbor, which has been improved by extensive engineering works. The river flows through the city from Lake Manistee to Lake Michigan, and is navigable for vessels of moderate draft. A municipally owned and operated airport is three miles to the north, on a federal highway. The United States Coast Guard maintains a Manistee station with three power boats. Products of the city's industries are salt, chemicals, paper, drop forgings, motor boats, furniture, clothing, highway markers, pumps, and a widely varied line of miscellaneous articles. Lumbering, formerly the foremost local industry, has been largely replaced by exploitation of salt and bromine deposits underlying the city. In its public and parochial schools Manistee has almost 2,000 pupils; its public library contains more than 30,000 volumes, and its parks total 50 acres. Orchard Beach State Park is two miles north of the city, on a bluff overlooking Lake Michigan. Eighteen denominations are represented in the city's churches. There is a modern hospital. Service and civic clubs, two music clubs, women's clubs and a country club contribute to the community's social and civic resources. Before the white man came, the Indians occupying the land about the site of the present city were Chippewas. White traders and missionaries of early times frequently camped hereabout. Father Jacques Marquette visited the locality. It was in 1841 that the first permanent white settlement was made. In that year one John Stronach and his son Joseph set up a sawmill. Here they found a strategic location for the lumber industry, as the river flowed through pine forests. In Manistee Lake there was good storage space for logs, and they could easily be floated down the stream to the mills for cutting. It was in 1882 that the salt deposits were discovered. Nineteen hundred feet underground is a stratum of salt rock 32 feet thick, and brine is pumped from a still lower depth, for use in manufacturing commercial salt. Manistee County was organized in 1855, and Manistee became a city in 1869. In 1861 the population was not more than 1,000; the Civil War and a disastrous fire retarded its development, but by 1869, the year of its incorporation as a city, the population had trebled. In 1871 the city was again almost destroyed by fire. A monument at the junction of state and federal highways marks a point on the old Chippewa Indian trail. Manistee is an Indian word meaning Spirit of the Woods. Commission government has been adopted by Manistee, and there is a city manager. The commissioners, elected by districts, one from each district, choose a mayor from their own number. The water-supply system is municipally owned and operated; the water comes from wells. Pop. (1940) 8,694; (1950) 8,642.

MANISTIQUE, măn-ĭs-tēk′, Mich., city and Schoolcraft County seat, altitude 613 feet, on the north shore at the eastern end of Lake Michigan, at the mouth of the Manistique River; on the "Soo" and the Manistique and Lake Superior railroads, and on state and national highways, 107 miles by rail southwest of Sault Sainte Marie. The Ann Arbor Railroad Company, in connection with its train service between Toledo and Manistique, operates a car ferry between Manistique and Frankfort, Michigan. U.S. Highway No. 2 crosses the Manistique River on a highway bridge that has a roadbed several feet lower than the surface of the water. Its construction and the control of the water level was considered a fine piece of engineering. The surrounding region has lumber and limestone. The city's manufactures and industries include paper, fitted lumber, wooden novelties, pulpwood, and brooms. Manistique has a public library and a hospital; parks, playgrounds, and recreational centers. The National Guard Armory is located here. The public school system includes one high school. Musical interests are conserved by a Municipal band, and a choral club, and the town has its quota of social, civic, and service organizations. Manistique was incorporated as a city in 1901. The name is of Indian origin, meaning Great Sandy Beach. Administration of local government is under the supervision of a city manager. The water supply system is under municipal ownership; the water is taken from Indian River. Manistique is a summer resort and a fishing center. As an added attraction to tourists the enormous spring, called by the Indians Kitch-iti-ki-pi (big spring) is located four miles west of the city. Pop. (1940) 5,399; (1950) 5,086.

MANITOBA, măn-ĭ-tō′bà, one of the three prairie provinces of Canada, is situated in the geographical center of Canada and of North America as well since a line drawn from Alaska to Florida will intersect a line from Labrador to southern California in this area. Formerly known as Red River Settlement (q.v.) or Fort Garry, the name Manitoba (Indian, *Manitou, Great*

Spirit) was adopted upon the enactment by the deral parliament of the Manitoba Act (1870) r which the province was created and provision ade for its admission to the new Dominion of anada of which it became the fifth province ily 15, 1870. In its early days the area of the ovince was so small that it was called the ostage stamp" province. Subsequent enlarge-ents in 1881 and 1912 have brought it to its esent size of 246,512 square miles. Of this ea, 26,789 square miles are fresh water includ-g three large lakes, Winnipeg (larger than ake Ontario), Manitoba, Winnipegosis, and in-umerable smaller ones.

Coat of Arms

The province is bounded on the south by the tates of Minnesota and North Dakota, on the est by the province of Saskatchewan, on the orth by the Northwest Territories, and on the ast by the province of Ontario and Hudson Bay. t extends from latitudes 49° to 60° N., longitude 5° to 102° W., and is approximately 275 to 500 iles wide.

The shield bearing the coat of arms of Mani-oba is divided laterally, the upper third being a hite ground bisected by a red cross, the lower wo thirds a pictured representation of a bison tanding on rocky ground on a field of green.

The floral emblem is the crocus, adopted 1906.

Geography.—Topographically the province is nteresting and unusual. It consists of five ap-roximately parallel areas running from north-vest to southeast. In the center is the fertile alley of the Red River and the large lakes, about 00 miles wide by 350 miles long. To the east s a country of granite rock, lakes, rivers, and orests, the western edge of the Pre-Cambrian hield of Canada. Further east and north is a lat, barren land bordering on Hudson Bay. To he west of the central section lies hilly agricul-ural country rising to about 400 feet above the alley, which is approximately 760 feet above sea evel, and, in its northern part, to the Duck and Riding Mountains with a maximum height of 2,800 feet. To the west of this strip, forming he southwestern portion of the province, lies the rue prairie country, the area which made *Mani-oba No. 1 Hard* the standard of high quality grain. From the southeast to the northwest runs a line dividing the grove and prairie areas from he heavy forests. Thus it will be seen that, hough always described as the most easterly of he three prairie provinces, much of it is not prairie country, all the more so since 40 per cent of its area is heavily forested. Five rivers of importance traverse the province—the Red River of the North, the Saskatchewan, the Nelson, the Winnipeg, and the Assiniboine.

National and Provincial Parks.—Riding Mountain National Park established in 1929 lies in southwestern Manitoba, just south of the Duck Mountain Provincial Park. It has an area of 1,148 square miles. Fort Prince of Wales, Manitoba's National Historic Park covers an area of 50 acres in the extreme north near Churchill. The fort was built in 1733 by the Hudson's Bay Company to guard its rights in pioneer days. It was established in 1941. Whiteshell Forest Reserve has an area of 1,078 square miles.

Population.—The population of the province which, by a census taken by the first lieutenant-governor in 1870, numbered 1,563, exclusive of Indians and Métis, had, by the Dominion census of a year later, grown to 25,268 and was, by the census of 1946, 727,000. In 1949 it was 778,000. (est.)

The periods of large growth are revealed by the ten year census figures: 1871, 25,228; 1881, 62,260; 1891, 152,506; 1901, 255,211; 1911, 461,-394; 1921, 610,118; 1931, 700,139; 1941, 729,744. This population is of many racial origins. Almost exactly one half has as its country of origin the British Isles. The other half, all but a small minority of Asiatics and Indians, is of European origin, the main racial stocks in order of numbers (census 1941) being: Ukrainians 89,762; French 52,996; German 41,479; Dutch, 39,204; Polish 36,550.

A special situation exists in the distribution of population in that more than 40 per cent of the people live in Greater Winnipeg, and there is no other large city. There are in all four cities, Winnipeg, St. Boniface, Brandon, and Portage la Prairie, 33 towns, and 35 incorporated villages. In the 114 rural municipalities there are other small urban communities.

Climate.—The climate of Manitoba is dry, clear, and invigorating with long winters, brief springs, hot summers and a clear bracing autumn. An outstanding characteristic is the amount of sunshine which in 1949 was 47.2 per cent of possible hours. The coldest months are January and February, the hottest, July and August. Over a period of 75 years for which accurate records have been kept the average mean temperature was 35.2°F. The coldest day on record (Dec. 24, 1879) showed —53°F.; the hottest (August 7, 1949) 104.2°F. Normal winter temperatures run to —10° to —20°F. Normal summer temperatures are to be found between 70° and 80°F. but at times rising above 90°F. and on rare occasions to over 100°F. Normal precipitation is about 20.5 inches of which 20-25 per cent is snow. June, July, and August are the months of heaviest rainfall. The fact that the periods of longest sunshine and heaviest rainfall coincide is responsible for the remarkably rapid growth of vegetation and the production of high quality grain and vegetables. The considerable depth of frost is another factor in providing bountiful moisture during the short growing season. The longest period of continuous frost free days varies from 100 to 109 days in the agricultural area.

Average mean monthly temperature for 1949: Jan. 1.8°F.; Feb. —6.2°; Mar. 15.8°; Apr. 42.6°; May 53.0°; June 63.4°; July 67.8°; Aug. 70.3°; Sept. 53.8°; Oct. 41.2°; Nov. 30.3°; Dec. 3.8°.

Precipitation for 1949 was 15.96 inches of

rain and 70.3 inches of snow, in all 22.96 inches. Humidity ranged from 22 per cent to 100 per cent.

Natural Resources.—Manitoba's natural resources, other than agriculture and water power are in her mines, forests, and lakes. The principal minerals produced, all found in the Pre-Cambrian shield, which covers 57 per cent of the area of the province, are copper, gold, zinc, and silver. Selenium, tellurium and cadmium are recovered as byproducts. Of the mines the most important is that of the Hudson Bay Mining and Smelting Co., at Flin Flon 400 miles northwest of Winnipeg. In the same area there are three other producing mines. Structural minerals are also available in abundant quantities, the chief one being Tyndall stone found about 20 miles northeast of Winnipeg and much used for public buildings. The total value of all minerals produced in 1948 was $24,400,000.

Over 40 per cent of Manitoba's land is forested and there is estimated to be a total stand of 2,675,000 board feet of saw timber and 28,640,000 cords of smaller wood. White spruce, black spruce, jack pine, aspen poplar, and balsam are the most important species. Over one million cords of poplar alone are available annually. In 1950 one large pulp and paper mill had been in operation for twenty years. The department of mines and resources is making vigorous efforts to protect and develop the forest wealth and controls seven forest reserves. The estimated net value of forest production in 1948 was $18,000,000.

The fishing industry, important since the early days, has been developed chiefly by people of Icelandic descent. Lake Winnipeg, and other lakes in the central part of the province, are the chief sources but in the colder northern lakes an unlimited supply is being made available by air transport. The most important varieties of fish found in all these waters are pickerel and white fish, and 90 per cent of the production is sent to eastern cities in the United States. To keep the lakes well stocked the government operates five fish hatcheries. In addition to the commercial fishing, these lakes attract large numbers of tourists and fishermen. Income from tourist traffic for 1949 (est.) was $20,000,000.

Water Power.—Hydroelectric power, potential and developed, furnishes the basis of Manitoba's industry as well as adding greatly to the well-being of the citizens, the city of Winnipeg having the largest domestic use of electricity on the continent. It is estimated that there are 3,000,000 horsepower still undeveloped. Completed developments, mainly on the Winnipeg River, furnished (1949) about 500,000 horsepower. Two great enterprises share this power—the Winnipeg Hydro Commission, a civic undertaking, and the Winnipeg Electric, a private corporation. Operating in competition with each other, they supply light and power to greater Winnipeg at what are said to be the lowest rates on the continent, on the average .847 cents per kilowatt-hour. The Winnipeg Electric in addition operates the transportation service of the metropolitan area rapidly being converted from street cars to trolley buses. The Winnipeg Hydro has developed with the use of offpeak power a remarkable central heating system which furnishes heat to the business area while private companies in the same way heat over 3,700 residences. In spite of the low rates, maintenance of the plant at a high standard, and provision of adequate sinking funds, it shows each year a substantial profit which goes to the relief of taxes. Since 1941 these contributions have risen steadily from $247,000 to $1,000,000. Power shortages are unknown although the power comes from a point about 100 miles distant. In 1949 further large developments on the Winnipeg River were commenced.

A third enterprise in this field is the Manitoba Hydro Commission which in 1950 had been in operation 30 years. This is a government undertaking distributing power through the province directly to consumers. Operating at first with communities, 350 of which were being served in 1949, it began in 1945 the electrification of farms. By the end of 1949, of the 52,000 farms in Manitoba, 12,000 had electricity in spite of the fact that there are only 1.3 farms per mile. This development is proceeding at the rate of 5,000 farms per year.

Winnipeg.—The capital of the province, Winnipeg (Cree—muddy water), became an incorporated city in 1873. Its nucleus was the Red River settlement which owed its origin to its position at the juncture of the Red and Assiniboine rivers. In the early days, when all travel was by water or oxcart, this location gave ready access in every direction; to the south, to the Minnesota and Mississippi rivers; to the east, via the Rainy River chain to Lake Superior; to the north, via Lake Winnipeg and the Nelson River, to Hudson Bay; to the west, via Lake Winnipeg and the Saskatchewan River, to every part of the Canadian prairies and thence, by way of the Mackenzie River, to the Arctic. When the railways were built the city's location was still exceptionally fortunate. Owing to the proximity of large lakes to the east and north and the United States boundary to the south, it is impossible for railways or roads to connect eastern with western Canada except through a "funnel" only 20 miles wide and 150 miles long. Winnipeg, situated in this funnel, was thus the only possible entrance within Canada to a rich agricultural territory 850 miles long and 200 to 400 miles deep. It became, and was for many years, the only distributing center for western Canada. The building of the Panama Canal made transportation by way of Vancouver cheaper as far east as the center of the prairies and so lessened the importance of Winnipeg in this respect. The population of the city was in 1949 (est.) 231,491. Around the city is a ring of suburbs intimately connected with all phases of life in the city proper. The population of this metropolitan area, known as Greater Winnipeg, was estimated in 1949 at 320,000.

The city is governed by a council consisting of the mayor and 18 aldermen, of whom six are elected from each of three wards under the proportional representation system. Also elected in the same way is the school board of 15 members which operates 70 school buildings.

Winnipeg, (area, 25 square miles) is noted for its wide streets, its large number of trees and its many beautiful boulevards. The parks board, appointed by the city council, manages 87 parks, squares, athletic fields, two golf courses, and 220 miles of boulevards. The water supply, owned by the city, is unusually good and comes from a lake 84.5 miles distant running under gravity through a concrete aqueduct. Under the management of the Winnipeg district water board it serves the metropolitan area of 55 square miles. There are many handsome churches and public buildings, mostly of Tyndall stone. tive building and the civic auditorium are among the most beautiful buildings in Canada.

Culturally the city is proud of its achievements. The Manitoba Musical Festival, held here each spring, is the largest in the British Commonwealth and it has developed a number of musicians who have won fame abroad. The Winnipeg Ballet has won a leading place in the country. There is a flourishing school of art and a much appreciated orchestra. National groups preserve their native music and arts.

As the center of the grain trade and of industrial production (see section *Industry*) Winnipeg is the focus of prairie business life. Before the Canadian government took over the selling of wheat and coarse grains, the Winnipeg Grain Exchange was the largest on the continent. During and since World War II the selling of all wheat and, for the latter part of the period, all grains, has been under the control of the Canadian Wheat Board. The grain companies still buy from the producers but at an interim price set by the board. Any profit made by the board is distributed among the producing farmers. (See WINNIPEG.)

Agriculture.—Farming continues to be the basic industry of Manitoba but, whereas it was once dependent on wheat, it is now much diversified. This diversification has followed three trends. First, from wheat to other cereals; second, to dairying, poultry and livestock; and third, to sugar beets, sunflowers, corn, field peas and vegetables for canning. Practically all the farms are mechanized and there is a steady development of larger farm units. The main crops are still cereals, wheat, oats, barley, rye, and flaxseed. In 1949 the total value of agricultural produce was $262,841,000 of which $89,480,000 was derived from wheat, $53,894,000 from livestock and $27,331,000 from dairy products. With the growth of livestock production has come the development at St. Boniface of the largest stockyards in Canada, capable of handling 25,000 head at one time.

The beginning of 1950 found the farming industry in Manitoba in a flourishing condition. Farm mortgages were at the lowest point since agriculture was established as an industry. The farming income (1949) was $238,000,000, an increase of 257 per cent in ten years, (1940–1949).

Industry.—The greatest change in the economic life of Manitoba, and particularly of the metropolitan area of Winnipeg, in the decade 1940–1949 occurred in the rise of manufacturing. Whereas in 1939 the gross production was worth $134,000,000, in 1949 it was valued at $483,000,000, and its net value was crowding agriculture for first place. Approximately 80 per cent of the production comes from Greater Winnipeg. Manufacturing gave employment (1949) to an average of 40,978 people, or 37 per cent of all employees, and the wages paid in 1949 were $87,000,000. There were (1949) 1,600 plants in operation producing about 1,100 products. It is notable that most of the plants are the result of local initiative. The largest single industry is found in the meat packing plants numbering 12 in all. Altogether they make Greater Winnipeg the largest center in Canada of this industry. Next come the needle trades which have developed rapidly during and since World War II. An outstanding feature of Manitoba's industry is the large number of small plants, some of which were (1949) being established in the smaller towns. The varied character of the population means a wide diversity of skills resulting in a great variety of products and the constant addition of new ones.

Industry is in a specially favoured position because of the large market at its doors. The western Canadian market stretching from the Great Lakes to the Rocky Mountains with a population of 2,500,000 people is the natural outlet for Manitoba production. For Greater Winnipeg, combined with Portage la Prairie, one of the most active of the smaller cities, the average of per capita purchases (1947) was $890 compared with $462 for the whole of Canada and $825 for the United States. It is noteworthy that of more than 100 British agencies established in Canada in 1949 over 90 per cent were located in Manitoba. Another helpful factor is the good situation in labor, its quantity, quality, and variety, its general good relations with employers, and the small number of strikes and lockouts (1949, 20,587 lost days). The government department of labor is active in maintaining this good relationship through its administration by boards of the Manitoba Labour Relations Act, the Fair Wage Act, the Minimum Wage Act, the Hours of Work Act, and the Vacations with Pay Act.

Of the gross value of industrial production (1948 est.) food and beverages account for $166,977,418, clothing (textiles and furs) for $34,457,418, and iron and steel for $30,394,097.

Finance.—The province has been fortunate in that for many years its finances have been managed in a sound and prudent manner. Although the expenditures increased from $16,960,000 in 1939 to $38,280,000 (est.) for 1950, the latter figure is far below that of the other western provinces which have approximately the same population. Provincial taxes are the lowest of any province in Canada. The debt of the province, as of March 31, 1950, was $100,800,000 of which $62,000,000 was not self-sustaining. Under an Act passed in 1947 this debt will be paid by 1974.

The city of Winnipeg's position is also sound. Exclusive of self-supporting debt, the city's debt, (Dec. 31, 1949,) was $14,000,000, against which the sinking fund was $7,000,000. Similarly the municipalities in the last ten years (1939–1948) reduced their liabilities by $6,000,000, and increased their assets $8,700,000.

Eight of Canada's 10 banks operate in Manitoba, having 59 branches in Greater Winnipeg. Checks passing through the Winnipeg Clearing House in 1949 amounted to $6,222,179,000. The Bank of Canada maintains a central agency in Winnipeg, as does its subsidiary, The Industrial Development Bank, which provides financial assistance to smaller businesses. Winnipeg is the head office of three insurance companies, one of them, the Great West Life Assurance Company, being one of the largest in Canada. Personal incomes of Manitoba citizens which in 1941 averaged $470.00 had by 1948 risen to $946.00, an increase of over 100 per cent compared to an 81 per cent increase in the national income.

Transportation and Communication.—Due to Winnipeg's geographical position it has become one of Canada's great railway centers. Two great railway systems, the Canadian Pacific and the Canadian National, have their western headquarters in Winnipeg which is also served by three smaller Canadian roads and is linked with the United States by the Great Northern, North-

ern Pacific, and Soo lines. The Canadian Pacific has within the city the largest individually owned railway yards in the world. The area of Winnipeg is also an important air center being at the major aerial crossroads of the continent. It is peculiarly fortunate in that its commercial airport is only four miles from the business center and is capable of indefinite expansion. Three airlines operate regular services: the Trans-Canada, the Canadian Pacific, and the Northwest. All three have regional operation headquarters at the airport. Water transport also plays its part. Canada's most inland seaport, Churchill, on Hudson Bay, which provides the shortest route to Europe from the middle of the continent, is within Manitoba making it a maritime province.

The Manitoba Telephone System is owned by the provincial government and operated by a commission appointed by it. It covers practically every inhabited section of the province including many of the remote mining areas. Its rural service is given at the lowest rates in the Dominion. Winnipeg has a full automatic service at a cost less than that of any city of its size on the continent. The commission maintains, at rates fixed by the Public Utilities Board, the plant at 100 per cent value and, in addition, has turned over to the province in 8 years (1943–1950) profits of $8,000,000. Seven radio broadcasting stations operate in the province including two short wave stations and the two Canadian railways give full telegraph service.

Health and Welfare.—The department of health, having administrative jurisdiction over all matters relating to health and welfare, is the largest department of the provincial government and is generally agreed to be one of the most advanced on the continent. In addition to widely spread and varied health services, it operates large hospitals for mental, incurable, and tubercular patients, has a far reaching nursing service, and is rapidly developing a system of health units. The Manitoba Hospital Service (Blue Cross) has enrolled within its membership 40 per cent of the people of the entire province, including two thirds of the citizens of Winnipeg.

Winnipeg has also a well-developed department of health giving medical, dental, and nursing services to all child-caring institutions, schools, and those citizens requiring free services. It operates three large hospitals for those suffering from tuberculosis, communicable diseases, and incurables with a capacity of 548 beds. Three large general hospitals and several smaller ones are operated under private boards.

The province maintains its own system of workmen's compensation and mothers' allowances, and cooperates with the federal government in the payment of old age pensions and pensions for the blind. Of these pensions the federal government pays 75 per cent. It also makes grants to the province for hospital construction and cancer control. Out of a total expenditure on these services of $3,900,000, the federal contribution is $2,870,000. Care of the unemployed and unemployables is the responsibility of the municipalities in ordinary times; in times of extraordinary stress in unemployment, the federal and provincial governments assist.

Winnipeg operates a large department of public welfare, and is the center of a wide variety of philanthropic institutions numbering 700 in all. The outstanding feature of social welfare work in Winnipeg lies in the wide use of volunteer workers under the direction of the Central Volunteer Bureau, a citizen's agency.

Education.—Elementary education is free and compulsory for all children between the ages of 6 and 14 years and also free for high school students to 21 years. It is organized upon the usual basis of 6 plus 3 plus 3. Entrance to the university is from the 11th grade, the 12th grade being equivalent to the first university year. All questions of curricula and general policy are under the control of the department of education, but the provision and management of the schools rests with the boards elected in school districts. The government makes substantial grants to these boards, the chief one providing an addition to the funds raised by local taxation up to a minimum of $1,400.00 per teacher, but the main support comes from the local taxpayers. There are approximately (1950) 120,000 students enrolled in all grades. Of those entering grade 1, 62 per cent reach high school entrance—grade 8, and 32 per cent university entrance—grade 11. General supervision of the schools, in which there are 4,700 teachers, is exercised by the department's staff of 35 inspectors. The government owns and operates a residential normal school, the only such school in Canada, in which approximately 400 teachers are trained each year; teachers in the secondary schools get their training in the faculty of education of the university.

Generous provision for technical education is made in the government's new Technical Institute where work in laboratories is given for one half of the time and general education for the other half. Advisory committees from labor and industry keep the curriculum in step with advances in industry. The institute also offers courses in post-high school work and some technical training is offered as part of the regular course in the larger schools. For this phase of education the federal government makes grants proportionate to the provincial outlay.

Government and Courts.—The legislature of Manitoba consists of 57 members. It exercises supreme control over all the affairs of the province which come within the authority of the province as defined in section 92 of the British North America Act. It is elected for a term of five years but is does not always continue for the full term, it being at the option of the government to call an election at any time.

The conduct of affairs is based on the British parliamentary system. Under this system the Cabinet, or executive, is chosen by the leader of the party from among the members of the party having the largest number. All Cabinet members must be members of the legislature to which body the Cabinet is directly responsible. Four parties share the allegiances of Manitoba's voters: Liberal, Conservative, Canadian Cooperative Federation (Socialist); and Communist (one member in 1950). Since Nov. 4, 1940, the province has had a coalition government, composed, in 1950, of Liberals and Conservatives. Douglas L. Campbell became premier, Nov. 13, 1948. The Canadian Cooperative Federation is the official opposition party. The franchise is held by all persons over 21 years of age except the insane, criminals, and Indians living in reservations. Judges do not vote. Manitoba is represented in the federal Parliament by 16 members in the House of Commons and 6 members in the Senate.

The titular head of the government is the

lieutenant governor who is the direct representative of the king and who, like the king, acts only on the advice of his ministers. He is appointed by the federal government for a term of not less than five years. The present (1950) lieutenant governor, Hon. R. F. McWilliams, was appointed in 1940.

Each department of government is directed by a minister, as members of the Cabinet are called. Departments (1950) are agriculture, attorney general, dominion-provincial relations, education, health and public welfare, labour, mines and natural resources, municipal, provincial secretary, public utilities, and treasury.

Local government is highly organized, the province being divided into cities (4), towns (23), villages (35), and rural municipalities (114). Each municipality has its elected council controlling local affairs with the aid and partial supervision of the provincial government. Each has also its own school board. (See section *Education.*) There are no counties.

The courts of Manitoba include the court of appeal, the high court of justice and the county courts. Judges of these courts are appointed and paid by the federal government. There are also police courts, juvenile courts, and a family court. Magistrates in charge of these are appointed by the provincial government. The province is divided into six judicial districts, each of which has a county court with a resident judge, the district of Winnipeg having four judges. The provincial government maintains a prison farm near Winnipeg and several jails. There are also reform schools for juveniles. The Royal Canadian Mounted Police assume the duties of provincial police.

History and Political Development.—Although Pierre Gaultier de Varennes, Sieur de la Vérendrye, of Quebec, was the first white man to see the site of modern Winnipeg, he was preceded by Thomas Button (q.v.), in 1612, and by Pierre Esprit Radisson and Médart Chouart, Sieur de Groselliers (q.v.) out of whose marvellous cargo of furs came the grant from King Charles II which, in 1670, created the Hudson's Bay Company (q.v.). Henry Kelsey was the first man to see the prairies (1691). There was no settlement until Thomas Douglas, 5th earl of Selkirk, having secured control of the company, sent out from the Scottish Highlands the first group in 1811. Those settlers suffered incredible hardships in the first years, and not until 1820 had their settlement at the junction of the Red and Assiniboine rivers a permanent basis. Thereafter it remained for 40 years an island of British folk in the great northwest, ruled by officials of the company which controlled the vast area draining into Hudson Bay. By 1860 conditions of isolation were disappearing. In another ten years Canada had bought the rights of the company for $1,500,000 and had created the province of Manitoba which became the fifth province of the three-year-old Dominion of Canada on July 15, 1870.

Preparations for this changed status had created restlessness among the Métis (French-Indian) who were greatly in the majority, and a rebellion, led by Louis Riel (q.v.), made the early days of the new province difficult. (See Riel's Rebellion.) The wisdom and caution of the first lieutenant governor, Adams George Archibald (q.v.), gradually succeeded in establishing the usual institutions of representative government. Immigration came steadily from eastern Canada, followed by the first European immigrants from Europe, Mennonites from Russia in 1874, and Icelanders in 1875. In 1876 the first shipment of *Manitoba Hard* wheat was sent to eastern Canada.

Prior to 1870 there was neither steamboat nor stagecoach running regularly to Winnipeg, but with the coming of the railways the pace of development began to quicken. Winnipeg experienced a fantastic land boom which collapsed in 1882, but left more men, more money, and many substantial buildings in the city. The province, however, faced a bleak prospect. It had an area of only 14,000 square miles; its only revenue was a meager subsidy from the federal government which had kept under its control all the natural resources including the lands; the Canadian Pacific Railway had been given a railway monopoly and extensive grants of land; even larger grants had been made to the Hudson's Bay Company. At every turn the province was hampered in development, especially in settlement and in the building of local railways which made settlement possible. Under John Norquay as premier (1878–1887), and his successor, Thomas Greenway (1888–1900), a bitter struggle was waged with the federal government to secure provincial rights. A moderate extension of the province's area, and increase in the federal subsidy, which left it still inadequate, and the surrender by the Canadian Pacific of its monopoly were gradually conceded. In 1912 the area of the province was extended to its present size, but not until 1930 did the province secure control of its own resources together with a payment of $5,000,000 for those already alienated.

All through this time of struggle, the question of what schools were to be allowed kept political life at a tension. The second Riel rebellion which broke out with the return of Riel from Montana (1885), was quickly put down, but it stirred into new life the latent contest between the French-Canadian and the English speaking populations. The Manitoba Act allowed the continuance of the church schools, the only ones then in existence. The settlement of large numbers of English-speaking Protestants from Ontario brought about a rapid decline in the numbers and importance of the French-Canadians. By 1879 their numbers in the legislature had declined from one half to one sixth. In 1881 the legislature ordered that the education grant, hitherto divided equally, should be distributed in proportion to the number of children of each race in each school district. In 1890 the old system was abolished. A department of education was established and given charge of all schools in which education was now to be free, all property being taxed for their support. No school which did not come under the new department, was to have any

grant. The French-Canadians, most of whom were Roman Catholics, were thus faced with paying double taxation if they wished to maintain their own schools in their own way. The validity of the law was challenged in the courts but the privy council held that the province had acted within its rights. The Manitoba School Question became a national one. In and out of parliament this question cut across political lines. In the election of 1896 Sir Wilfrid Laurier (q.v.), himself a French-Canadian, fought for the right of Manitoba to pass her own legislation, and won. As prime minister (1896–1911) he succeeded in effecting an arrangement with the Greenway government by which bilingual instruction might be given in English and in any other language. With the coming of immigrants from many lands the bilingual privilege was grossly abused. Barely one half of the children were attending school. In 1915 a new government headed by Tobias Crawford Norris (q.v., 1915–1922), with Dr. Robert Stirton Thornton as minister of education, came into office on a policy of compulsory education, which received popular support.

Shortly after the Laurier government came to power, it embarked on an active policy of assisted immigration under the direction of Clifford Sifton (q.v.), a Manitoban, who became minister of the interior. Almost at once American farmers poured into the country followed by eastern Canadians and British, and then by large numbers from Europe. The majority of these immigrants went on farther west but thousands remained in Manitoba. Her population which had been 91,279 in 1901 increased to 461,394 in 1911 and the peak of immigration was not reached for another two years. In 1914 the World War I stopped this movement. Manitoba sent large contingents to join the struggle and, in spite of a labor shortage, produced large quantities of food for the Allies. Just as her troops were returning, the most protracted general strike of labor in the history of Canada broke out in Winnipeg For six weeks the city was without the usual services except those which could be partially continued by volunteers. In the end the strike was broken.

In 1920 the sudden fall in wheat prices brought disaster to the farmers and, in consequence, great hardship to the whole province. In their despair the western farmers turned to political organization and the progressive movement was born. It went from success to success In Manitoba this party won the election and a farmers' government resulted under the leadership of John Bracken (q.v.). The following year the farmers of Manitoba joined those of the other prairie provinces in the decision to organize voluntary pools for the handling of wheat. Already the United Grain Growers, which had its beginning in Manitoba in 1906, had shown what could be done by voluntary association. The idea spread like wildfire and by 1924 the Manitoba pool was in operation. In the time of high prices in the next six years the pool flourished but came to disaster when world prices again fell early in 1930. But by this time the pool was able to exercise strong pressure and the government came to its rescue. It passed successfully through the years of depression (1930–1937), repaid its loan and again became highly successful. Of the 52,000 farmers in the province somewhat more than one half were (1949) members of the pool which in the crop year of 1948–1949 handled 45 per cent of all the grain sold.

The province also suffered heavily in the depression years, but came through with its credit unimpaired—the only one of the Prairie provinces to do so. In World War II Manitoba played the same part she had in the World War I in the sending of forces and food products, but her factories had by then sufficiently developed for her to share in the production of munitions; the basis of her present industry was laid in those years.

The most important event in Manitoba's history since World War II has been her cooperation with seven of the 10 provinces in a new financial arrangement with the federal government. Under the new plan, the provinces surrendered to the federal authority their right to impose income taxes, succession duties, and most corporation taxes, for five years terminating March 31, 1952, and received in return a much larger subsidy. In the first year (1947–1948) the result was an increase in Manitoba's revenue of $5,400,000. Provision for additional amounts in proportion to the national income has made a further increase of $9,900,000. See CANADA.

MARGARET MCWILLIAMS,
Author of "Manitoba Milestones" and "This New Canada."

MANITOBA, Lake, Canada, situated in Manitoba province, to which it gives its name, is about 59 miles southwest of Lake Winnipeg. It is of irregular shape, 119 miles long, with a maximum breadth of 29 miles, a shoreline of 535 miles, an area of 1,817 square miles and an average depth of 12 feet. It is 810 feet above sea level, and 40 feet higher than Lake Winnipeg, into which it drains through the Saskatchewan or Dauphin River. It was discovered in 1739 by Pierre Gaultier de Varennes, Sieur de la Vérendrye.

MANITOBA, University of. Long before the formation of the Province of Manitoba in 1870, education in the Red River Settlement had been promoted by the churches. A school opened by Father Provencher in 1818 later developed into the Roman Catholic College of St. Boniface. Various schools functioned precariously under the Anglican clergy from 1820 until St. John's College was finally established in 1866 by Bishop Machray. Lord Selkirk's Scottish settlers, with the help of the Presbyterian Church, organized a school in 1847, which later, upon the arrival of Dr. George Bryce from Ontario in 1871, gave rise to Manitoba College. It was due to the vision and zeal of George Bryce and his contemporaries, and not less to the support and statemanship of Hon. Alexander Morris, lieutenant governor from 1872 to 1877, that the University of Manitoba came into being on February 28, 1877, as an examining and degree conferring body.

The population of Manitoba in 1871 was only

25,228. New settlers from the east did not begin to arrive in any numbers until 1879. The Provincial Government, which granted the University of Manitoba charter in 1877, regarded it as premature, but yielded to the urging of its advocates who wished to secure an impartial standard in higher education and to ensure cooperation instead of sectionalism among the denominational colleges. The government of the university was vested in a council on which the original colleges were equally represented. All teaching continued to be done by the colleges according to a common curriculum, until the expense of developing scientific subjects made necessary the next major change in the university.

The first professors were appointed in 1904, five in number, to give instruction in mathematics and the natural sciences in a new building, the first which the university had possessed. Slowly but steadily the university expanded its teaching departments by the addition of professors of civil and electrical engineering (1907, 1909), architecture and modern languages (1913), until in 1914 for the first time it offered the full work for the bachelor's degree in arts and science. It was in 1914 that Manitoba College restricted itself to theology and its students and staff in arts transferred to the university.

Expansion inevitably brought a change in administration. The acquisition of students, staff and building involved income and expenditure, the latter much greater than the former. The province, which since 1877 had needed to contribute little financial support, now began to be asked for increasing annual grants. An endowment of 150,000 acres of land obtained from the Dominion Government in 1898 added gradually but substantially to the university's revenue as sales were realized. The University Act of 1917 established a board of governors, appointed by the provincial government, as the plenary authority in the university. In 1934 graduates obtained the right to elect three members to this board. The university council continued to have general charge of academic work until it was replaced by the Senate set up under a new University Act of 1936. The university has had a chancellor, a vice chancellor and a registrar since 1877.

Subsequent to the granting of the charter, other denominational colleges became affiliated with the university and now prepare candidates for the university's degrees in arts and science. The earliest of these to join was Wesley College (1888), now united with Manitoba College as United College. Later came St. Paul's College (R.C., 1931) and Brandon College (1938), which severed its conection with the Baptist Church when it sought support from public funds.

In the first half of the century, the university's rapid growth was marked by the adhesion of a number of professional schools and the establishment of others as faculties and schools of the university. These included medicine 1882, pharmacy 1902, agriculture 1907, home economics 1911, law 1914, engineering 1920, architecture 1924, education 1935, commerce 1937, interior design 1938, nursing education 1943, social work 1943, music 1944, fine and applied arts 1950. In 1949 the Committee on Graduate Studies was reconstituted as a Faculty of Graduate Studies and Research.

In 1913 the agricultural college occupied a new group of buildings five miles south of Winnipeg in the municipality of Fort Garry. To this beautiful site of 1,100 acres in a bend of the Red River the university was moved gradually as other buildings were erected. In 1950 the move was complete. The law school and the faculty of medicine remained in Winnipeg. In 1950 the total enrollment of students was 5,50(in regular courses leading to degrees and de plomas, and 2,800 in summer school and othe courses. The staff numbered 296 full time and 257 part time instructors.

W. M. Hugill,
Professor of Latin and Greek.

MANITOU, măn'ĭ-tōō, a name given, among the American Indian tribes, to any spirit or supernatural being, good or evil; also applied to any object of religious awe and reverence. "The Illinois," wrote the Jesuit Father Marest, "adore a sort of genius, which they call manitou; to them it is the master of life, the spirit that rules all things. A bird, a buffalo, a bear, a feather, a skin—that is their manitou." "If the Indian word manitou," says John G. Palfrey, "appeared to denote something above or beside the common aspects and agencies of nature, it might be natural, but it would be rash and misleading to confound its import with the Christian, Mohammedan, Jewish, Egyptian, or Greek conception of Deity, or with any compound of a selection from some or all of those ideas." The word was applied to any object used as a fetish or an amulét.

MANITOU SPRINGS, Colo., town and resort in El Paso County; altitude 6,336 feet; 3 miles northwest of Colorado Springs, and 9 miles from the summit of Pike's Peak; on the Denver and Rio Grande Western; Midland Terminal; and Manitou and Pike's Peak railroads. The town has been known as Manitou and Manitou Iron Springs. The Manitou and Pike's Peak cog railway, more than eight miles long, goes to the summit of the Peak, and there is an inclined railway to the top of Mt. Manitou (9,455 feet). Its healthgiving, highly radioactive mineral springs of soda and iron, saturated with carbonic acid gas, flowing a quarter of a million gallons daily, were known to the Indians and were a neutral ground, their sacred character being marked by the name Manitou meaning Great Spirit. John Charles Frémont (q.v.), explored this region in 1843 and analyzed the waters, which for a while were called Frémont Soda Springs. West of the town is Pike National Forest, part of the Pike's Peak State Game Refuge, and one of the largest forest preserves in the state. Near by are many scenic attractions, such as the Garden of the Gods, with unusual shapes and colors due to erosion, the Cave of the Winds, Rainbow Falls, and Ute Pass. Like Colorado Springs, Manitou was developed largely by General William Palmer, who, with Dr. William A. Bell, founded it in about 1872. Pop. (1940) 1,462; (1950) 2,580.

MANITOULIN (măn-ĭ-tōō'lĭn) **ISLANDS,** Canada, a group of islands in the northern part of Lake Huron, partially separating the waters of the lake from Georgian Bay, and east of the famous "Soo" Canal. The name is a corruption of the Indian word Manitouin, which means divinity. Except Drummond Isle, about 24 miles long and 9 miles

wide, which belongs to the State of Michigan, the group is a part of the Province of Ontario. The largest island of the group is Grand Manitoulin, or Sacred Isle; about 80 miles long and 30 miles at the widest. The coast is very irregular. Cockburn, or Little Manitoulin, is nearly circular, and about eight miles in diameter. All the islands are well wooded; Grand Manitoulin and Cockburn have large pine forests. The shore waters abound in fish. About one fifth of the inhabitants are Indians of the Algonquin tribe. The cool climate in summer and the striking natural features add to the attractions of the islands and make them a favorite summer resort. Pop. (1941) 10,841.

MANITOWOC, măn'ĭ-tō-wŏk, city, Wisconsin, seat of Manitowoc County and a port of entry, altitude 595 feet, is located on Lake Michigan, at the mouth of the Manitowoc River, 25 miles north of Sheboygan, on the Ann Arbor; Chesapeake and Ohio; Chicago and North Western; and Soo Line railroads. It has a municipal airport. It has a good harbor, shipbuilding and repair yards, grain elevators, fisheries, and an extensive coal trade. Its manufactured products include aluminum ware and castings, flour and malt products, furniture, canned vegetables, cheese, and condensed milk.

The British North West Company had a fur trading post here in 1795, and permanent settlement began with the land boom of 1835. Many Germans settled here in 1848, followed soon by Norwegians and Irish; Bohemians came in 1854, and Poles after 1865. The city was chartered in 1870. The name is an Indian word meaning "home of the Great Spirit." Pop. (1940) 24,404; (1950) 27,598.

MANIWAKI, măn-ĭ-wô'kĭ, village, Canada, Quebec Province, capital of Gatineau County, is located at the confluence of the Gatineau and Desert rivers, 82 miles northwest of Ottawa, and is the terminus of a branch of the Canadian Pacific Railway. In a lumber region, it has pulp mills and sawmills. The region is also famous for winter sports, hunting and fishing. There is a Roman Catholic college and hospital here, and a weekly newspaper. The village was incorporated in 1930. Pop. (1951) 3,835.

MANIZALES, măn-ĭ-zä'lĕs; -zăl'ĕs (Span. mä-nê-sä'lâs), city, Colombia, capital of Caldas Department, is located 110 miles northwest of Bogotá, at an altitude of 7,064 feet, on a ridge of the Cordillera Central range of the Andes Mountains. An aerial tramway 45 miles long connects it with Mariquita. It is an important coffee center, and there are gold, silver, and mercury mines nearby. It has a pleasant climate, though the rainfall is heavy, and is a modern city with fine parks, schools, cathedral, library, theaters, and a stadium.

Manizales was founded in 1847 by prospectors for gold, who named it for a kind of stone they found there and called maní. It was the scene of conflict during the civil wars of the mid-19th century, was destroyed by earthquake in 1878, and by fire in 1925. Since then it has been rebuilt largely of concrete. Pop. (1938) 51,025.

MANKATO, măn-kā'tō, city, Minnesota, seat of Blue Earth County, on the Minnesota River at the mouth of the Blue Earth River, 85 miles southwest of St. Paul, on the Chicago, Milwaukee, Saint Paul and Pacific; the Chicago Great Western; the Chicago and North Western; and the Chicago, Saint Paul, Minneapolis and Omaha railroads. It is situated in an agricultural region and in the vicinity are valuable stone quarries. Nine miles south is the Rapidan Dam, furnishing hydroelectric power for numerous southern Minnesota cities and villages. Mankato is the leading metropolis of southwestern Minnesota, and the trade center for that section. Its factories produce brick, cement, clothing, leather goods, flour, foods, boxes, brooms, and numerous other items. The Mankato hog market is one of the largest in the state, and the poultry industry and the creamery business are important factors in the city's commerce.

Mankato is the Sioux name for the blue earth found in the vicinity, specimens of which Pierre Le Sueur shipped to France in 1701 believing them to be copper-bearing. The city was laid out in 1852. During its early days Indians caused much trouble. Following the uprising of 1862, over 400 Sioux Indians were tried for murdering white settlers, and 303 condemned to death were brought to Mankato and held at Camp Lincoln, now Sibley Park. President Abraham Lincoln commuted the sentences of all but 38 and these were hanged simultaneously from a single gallows on Dec. 26, 1862. Mankato was incorporated as a village in 1865, and chartered as a city in 1868. It is the seat of a state teachers college and of Bethany Lutheran College. Pop. (1950) 18,809.

MANLEY, măn'lĭ, **John,** American naval commander: b. 1734; d. Boston, Feb. 12, 1793. At the outbreak of the Revolutionary War he was given command of the armed schooner *Lee,* with which he cruised along the coast of Massachusetts Bay, making captures of great value to the American army then at Cambridge. In July 1777 his ship, the *Hancock,* was captured by a British frigate and after a rigorous confinement on a prison ship in New York harbor, he was exchanged in March 1778. In 1782 he was put in command of the *Hague* frigate, which, after lying in a perilous position off the West Indies for three days, exposed to the fire of four British ships, contrived to effect her escape, and in January 1783 captured the *Baille.* This exploit closed the regular maritime operations of the United States during the Revolutionary War.

MANLEY, Joseph Homan, American journalist and politician: b. Bangor, Me., Oct. 13, 1842; d. Augusta, Me., Feb. 7, 1905. He was graduated from the Abbott Family School for Boys at Farmington, Me., in 1858 and in 1863 from the Albany Law School in Albany, N. Y. He was admitted to the bar in 1865. In 1866 he was president of the city council of Augusta and in 1881 was appointed postmaster of Augusta, an office he held for seven years. Acquiring a half interest in the *Maine Farmer* in 1878, he joined with James G. Blaine in local and national politics, dictating the editorial policy of that paper for three years. He was a delegate to the Republican National conventions of 1880, 1888, 1892, and 1900; member of the state Senate in 1903–1904; was for many years chairman of the Maine Republican State Committee; a member of the Republican National Committee, and chairman in 1896–1904; and was a notable figure in

the executive committees of 1896 and 1900, which aided in the election of McKinley.

MANLEY, Mary de la Rivière, English author: b. in the Island of Guernsey about 1663; d. London, July 11, 1724. She succeeded Swift as editor of the *Examiner* in 1711. She is known for her *Secret Memoirs and Manners of Several Persons of Quality of Both Sexes: from the New Atlantis* (1709), a licentious satire reflecting on politicians of the day, that caused the arrest of both the author and the publisher though they were subsequently discharged. This work was continued in the *Memoirs of Europe* (1710). She also published *Letters Written by Mrs. Manley* (1696); *The Secret History of Queen Zarah and the Zarazians* (1705); *The Adventures of Revella* (1714); *The Power of Love: in Seven Novels* (1720), and other unimportant books.

MANLIUS, măn'lĭ-ŭs, **Marcus,** Roman legendary hero, of the 4th century B.C., called Capitolinus because of his successful defense of the Capitoline Hill. Tradition says he was aroused to action by the cackling of Juno's sacred geese just in time to prevent the surprise of the citadel by the Gauls (390 B.C.). Two years before he defeated the Aequi; and in six years after (384 B.C.) was thrown from the Tarpeian rock, having been declared guilty of plotting to become king or dictator. This judgment, almost certainly unjust, was due to the envy of the patricians, who distrusted Manlius' philanthropic endeavors to free plebeians sold for debt.

MANLY, Basil, American clergyman and educator: b. Pittsborough, Chatham County, N.C., Jan. 28, 1798; d. Charleston, S.C., Jan. 25, 1865. He was graduated at South Carolina College in 1821, and, after filling several charges, in 1837 he became president of the University of Alabama, remaining there nearly 20 years.

MANLY, John Matthews, American educator and author: b. Sumter County, Ala., Sept. 2, 1865; d. April 2, 1940. He was graduated from Furman University in 1883 and from Harvard in 1889, and took his D.Ph. at Harvard in 1890. From 1891 to 1898 he was associate professor and professor of English at Brown University and from 1898 to 1933 was professor and head of the department of English at the University of Chicago. In 1909 he was Chicago exchange professor at the University of Göttingen. He was a member of the Modern Language Association. He contributed to the *Cambridge History of English Literature* and to the *Encyclopaedia Britannica* and to various periodicals. He edited *Macbeth* (1896); *Specimens of the Pre-Shakespearean Drama* (1897); *English Poetry* (1907); *English Prose* (1909); *A Manual for Writers,* with J. A. Powell (1914); *English Prose and Poetry* (1916); *Contemporary American Literature* (1922); *Some New Light on Chaucer* (1926).

MANN, Sir Donald D., Canadian contractor and financier: b. Acton, Ontario, March 23, 1853. In the later 70's he went West, became manager for a firm of contractors who had a sub-contract on the Canadian Pacific line and thereafter worked continuously as a contractor until the completion of the main railway. Between 1881 and 1883 he completed various contracts for railroads and in the two following years began railroad-building in the mountains. He also undertook contracts for construction and tunnels in Columbia Cañon and in the Selkirk Range of the Rocky Mountains. Together with Sir William Mackenzie (q.v.) he constructed the Canadian Northern Railway (q.v.). In 1887 and a part of 1888 they constructed the Canadian Pacific short line through Maine. In December 1888 Mr. Mann visited Panama, Ecuador, Peru and Chile with a view of building railways for the Chilean government, but was not satisfied with the prospects there and declined the contract offered. Later he visited China. He was associated with the building of the Qu'Apelle, Long Lake and Saskatchewan Railway, and was one of the original syndicate which built the Winnipeg Electric Street Railway. He was also interested in many other enterprises. He was knighted in 1911. He died Nov. 11, 1934.

MANN, Heinrich, German novelist, brother of Thomas Mann (q.v.): b. Lübeck, March 27, 1871. He attended the Katharineum School in his native city and then entered business. In 1893 he moved to Munich, later changing his abode to Berlin, with frequent sojourns in Italy, particularly Florence. His permanent home he finally fixed at Munich. Like his brother Thomas, Heinrich is a reserved, unsociable character, who has developed a feeling almost of hostility for the types of German life with which he is surrounded. His mother was partly of creole origin, and this circumstance is taken by some German critics (e.g., Kurt Martens in his essay in *Literatur in Deutschland,* 1910) as explaining Heinrich's predilection for the life and literature of the Romance countries as opposed to those of the Germanic countries. His first works were volumes of short stories: *Das Wunderbare* (1897); *Ein Verbrechen und andere Geschichten* (1898). Next came novels: *In einer Familie* (1898); *Im Schlaraffenland* (1901); *Die Göttinnen, oder die drei Romane der Herzogin von Assy* (3 vols., 1902–03); *Die Jagd nach Liebe* (1904). *Die Göttinnen* represents an ideal of womanhood in three different phases (Diana, Minerva, Venus) and is a brilliantly constructed hymn of joy in the Romance style. Again he turns to the short story: *Flöten und Dolche* (1905); *Professor Unrat* (1905); *Eine Freundschaft* (1906). *Zwischen den Rassen* (*Between the Races,* 1908) is a novel dealing with the affection of a young girl, Lola Gabriel, for a German and an Italian, who are supposed to incorporate the virtues of their respective races. It has met with great popularity, but the attempt to capitalize racial characteristics in this way is too great a task for all but the greatest men. Heinrich Mann has also tried his hand at the drama, in *Die Schauspielerin* (1911), but with no particular success.

JACOB WITTMER HARTMANN.

MANN, Horace, American educationist: b. Franklin, Mass., May 4, 1796; d. Yellow Springs, Ohio, Aug. 2, 1859. He was graduated from Brown University in 1819, studied law at the Litchfield (Conn.) Law School and in offices at Dedham, Mass., in 1823 was admitted to the bar, and practised at Dedham from 1827 to 1833, when he removed to Boston. In 1827–33 he was a representative in the state legislature, in 1833–37 state senator and in 1836–37 presi-

dent of the senate. From the first he identified himself with philanthropic interests. His first speech in the assembly was on religious liberty; and one of his enterprises was the establishment of the State lunatic hospital at Worcester (1833), in connection with which he was chairman of the board of commissioners and later of the board of trustees. In 1837, upon the appointment by the State of a board of education to revise and reorganize the Massachusetts common-school system, Mann became secretary to the board (19 June). He withdrew from politics and from a lucrative practice at the bar, and devoted himself entirely to a work which proved of the greatest significance not for Massachusetts only but for the entire United States. This work he accomplished largely in spite of opposition often pronounced. For the reform of State education he founded and edited the monthly *Common-School Journal*, held teachers' conventions, published 12 most valuable annual reports and established normal schools. In 1843 at his own expense he visited Europe for the study of Continental methods. He was successful in arousing throughout the country an unprecedented interest in educational affairs. In 1848 he was elected to Congress to succeed John Quincy Adams, deceased; and he served until March 1853. He was strongly opposed to slavery, and fearlessly attacked Webster's course. On 15 Sept. 1852, he declined the nomination for the governorship of Massachusetts, and on the same day accepted the presidency of Antioch College, Yellow Springs, Ohio, in which post he served until his death, greatly influencing the educational development of Ohio. He was a Fellow of the American Academy of Arts and Sciences. In addition to his annual reports he published 'Reply to 31 Boston Schoolmasters' (1844); 'Report of Educational Tour' (1846); 'A Few Thoughts for a Young Man' (1850); 'Slavery: Letters and Speeches' (1852); 'Lectures on Intemperance' (1852); 'Powers and Duties of Woman' (1853); and 'Sermons' (1861). Consult the 'Life' by Mary P. Mann (1865); and Boone, 'Education in the United States' (1890); 'Report' (United States Commission of Education, 1895–96); Hubbell, G. A., 'Life of Horace Mann' (1910).

MANN, James Robert, American congressman: b. near Bloomington, Ill., 20 Oct. 1856. He was graduated at the University of Illinois in 1876 and at the Union College of Law, Chicago, in 1881. He was admitted to the bar in 1881 and thereafter practised law at Chicago. He was attorney for the village of Hyde Park in 1888 and upon its annexation to Chicago he became alderman of the 32d ward, serving in 1893–96. He was temporary chairman of the Republican State Convention in 1894. He was master in chancery of the Superior Court in Cook County in 1892–96, and general attorney of the South Park Board, Chicago, in 1895. He was elected to Congress in 1896 and served continuously until his death, 30 Nov. 1922. He was leader of the Republican minority in the House during the Wilson Administration.

MANN, Matthew Derbyshire, American gynecologist: b. Utica, N. Y., 12 July 1845; d. Buffalo, N. Y., 3 March 1921. Graduated at Yale 1867, at College of Physicians and Surgeons, Columbia, 1871, he later studied in Europe. He practised medicine in New York in 1873–79; was established as a specialist in obstetrics at Hartford, Conn., in 1879–82; and in 1880–82 he was clinical lecturer on gynecology at Yale. He was professor of obstetrics and gynecology at the University of Buffalo in 1882–1910, and later was consulting gynecologist and obstetrician at the Buffalo General Hospital. He was president of the American Gynecological Society in 1894. He edited 'American System of Gynecology' (1888). Author of 'Manual of Prescription Writing' (1879).

MANN, Thomas, German writer of novels and short stories: b. Lübeck, 6 June 1875, of a wealthy family of merchants, whose traditions of solidity and solvency surrounded him in his youth and gave him the material for his treatment of the family life of the Hanseatic patricians in 'Buddenbrooks' and other works. After his father's death (1893) the family settled in Munich, where Mann joined them later (1894), and where he became an apprentice in the offices of the South German Fire Assurance Bank, a position of which he soon wearied. He attended lectures on æsthetics and literature at the University of Munich, later lived at Rome, returning to Munich in order to join (1899) the staff of *Simplicissimus* (q.v.), to which he remained attached for a number of years. Mann has a delicacy and refinement of style and observation that are unparalleled in German literature. In his first long novel, 'Buddenbrooks' (1901), which established his literary reputation, as well as in his short stories, he captivates by a psychologic naturalism which is enhanced by the fact that the feelings depicted are those of well-to-do middle class persons in comfortable, if not luxuriant, surroundings. Henry James, whose attention is usually devoted to a higher social class, is the English novelist whom Mann's delicate and insinuating treatment most resembles, and the two men are also similar in their scrupulous precision and artistry of language. 'Der Tod in Venedig' ('A Death in Venice,' 1913), which has the proportions of a German *novelle* (about 100 pages), describes the last hours of an elderly German writer. 'Der Zauberberg' (The Magic Mountain), published in 1926, is generally conceded to be his greatest novel. It contributed much toward making him the Nobel Prize Winner in Literature in 1929. He has written many short stories, some essays, and a play. Later works are 'Joseph and His Brethren' (1937); 'Joseph in Egypt' (1938); 'The Coming Victory of Democracy' (1938). The Nazi régime forced him into exile. In 1938 he came to the United States and the same year was made lecturer at Princeton University.

MANN, Tom, English Socialist: b. Foleshill, Warwickshire, 15 April 1856. His boyhood was spent in farming and mining and from the age of 14 he served an apprenticeship of seven years at engineering in Birmingham; in 1877 he went to London, where he was prominent in connection with various trade-union affairs, and in 1885 he became a Socialist. Among his works are 'The International Socialistic Movement'; 'Russia in 1921'; 'Tom Mann's Memoirs.' D. England, 13 March 1941.

MANN, William Julius, American Lutheran clergyman, educator and author: b.

Stuttgart, Germany, May 29, 1819; d. Boston, Mass., June 20, 1892. He was educated at Stuttgart and Tubingen and was ordained in the Lutheran ministry in 1841. He came to the United States in 1845 with Dr. Philip Schaff. He was assistant pastor at Saint Michael's and Zion's congregation, Philadelphia, in 1850–63, pastor in 1863–84 and thereafter pastor emeritus. He was professor of Hebrew ethics and symbolics at the Lutheran Theological Seminary at Philadelphia from the time of its establishment. Author of *Plea for the Augsberg Confession* (1856); *The Lutheran Church and its Confessions* (1880); *Life and Times of Henry Melchoir Mühlenberg* (1887), etc.

MANNA, a name for several substances, especially a saccharine matter which exudes naturally or from incisions made in the trunk and branches of a species of ash (*Fraxinus ornus*). It first appears as a whitish juice, thickens on being exposed to the air and when dried forms a whitish or reddish granular substance, which is the manna of commerce. The tree is a native of Italy and is cultivated extensively in Sicily. June and July are the two months in which the manna is collected. It is detached from the trees with wooden knives and is afterward exposed to the sun for drying. A little rain, or even a thick fog, will often occasion the loss of the collections of a whole day. The taste is sweet and slightly nauseous. It is a mild purgative and is principally administered to children. The finest kind of manna is called *flake manna;* it is white or yellowish-white in color, light, porous and friable. *Sicilian manna* is generally found in small, soft, round fragments; its color is yellowish-brown and it is generally mixed with more or less impurities. The principal constituent is mannite, chemically separable as a white crystalline substance of a sweetish taste, which also appears as a whitish efflorescence on certain edible seaweeds and fungi. To this and the saccharine elements, the nutritiousness of manna is due.

Many other sweet tree-juices go by the name of manna, or false manna, since they contain no mannite, but depend for their peculiar qualities upon the possession of melitose or meletzitose. In many cases the exudation of the sap is due to the irritation produced by insects or is the product of the insects themselves. Thus edible exudations are obtained from the Oriental teatree, sandal-wood and an Australian grass (*Andropogon*); in Europe from the larch and an oak, and in Persia from the camel's thorn. American manna is derived in California from the sugar pine and from a rush (*Phragmites*); while in India a species of bamboo secretes it so copiously as to form an important food-resource for the people in periods of famine.

The tamarisk manna, derived from the tamarisk trees about the eastern end of the Mediterranean, is not a direct product of the tree, but of a scale-insect, the manna-insect (*Jossyfraria mannifera*), which abounds upon the tamarisk and secretes the substance, which some persons have regarded as the manna of the Bible. In Australia the waxen larval cases of several species of flea-lice (*Psyllidae*) that feed upon the gum-trees (*Eucalyptus*) are gathered and eaten by the natives under the name of "lerp."

The Scriptural manna (Heb. Man-hu, what is it?) is described in Exodus (xvi, 15) as covering the ground in such quantities as to supply food for the vast multitude of the Israelites. It was small and round like coriander seed, white and tasting like honey and wafer. It was of the color of bdellium (Num. vi, 7). According to the Biblical narrative it was the food of the Children of Israel for 40 years. They complained of the diet (Num. xi, 6). In Rabbinical literature there are a vast number of stories about the manna hard to accept except as myths. It cannot be identified with any of the substances known nowadays as manna; but is called in the Bible "bread from heaven," while the Jewish doctors taught that it became to each person who ate it that meat of whatever kind he liked best.

MANNAIA. See GUILLOTINE.

MANNHEIM, män'hīm, Germany, a large town of Baden on the Rhine, at the confluence of the Neckar, 45 miles south of Frankfort. It lies in the administrative district of Mannheim, of 1,386 square miles area and 707,303 population. Dikes protect it from inundation and there are extensive harbors and modern docks. A bridge across the Rhine, here 1,200 feet wide, connects with Ludwigshafen, Bavaria, and there is also a bridge across the Neckar. Mannheim is the first commercial town in the Free State and on the upper Rhine. This it owes to its admirable position on two important navigable rivers and its railway communications. During World War I it was important as a distributing point for the German army. It was several times bombed by French and British aircraft, but without serious damage. The principal articles of trade are corn, flour, wood, petroleum, coal, tobacco, cattle, sugar, iron goods, etc. The manufactures consist chiefly of iron-castings, machinery, chemicals, cigars, carpets, woolen goods, paper, tiles, celluloid and rubber wares, mirrors, carriages, trinkets, sugar, liqueurs, starch, glue, etc. Mannheim was once strongly fortified and lying not far from the French frontier and near the center of military operations, suffered severely during the wars between France and Germany. In a siege by the Austrians in 1795 only 14 houses remained uninjured. Hence, notwithstanding the antiquity of its foundation, it has become an entirely modern town with regular, straight streets, known, as in America, by numbers, and with fine public squares. The principal buildings are the former Palatine palace, with a museum and picture gallery in one of its wings, a public library of 75,000 volumes and good gardens behind it; the Jesuits' church, an imposing edifice, with a profusely decorated interior; the former observatory building; the theater, one of the best in Germany; several gymnasia and schools, conservatory of music, hospitals and orphanage, town-house, railway station, etc. In 1899 the suburb of Neckaran was incorporated with it. Pop. (1939) 283,801.

MANNING, măn'ĭng, **Daniel,** American journalist and financier: b. Albany, N.Y., May 16, 1831; d. there Dec. 24, 1887. At 10 he entered the printing office of the Albany *Atlas* which shortly after was merged in the *Argus,* upon which paper he became a reporter and in time an authority in state politics. He was as-

sociate editor and part owner in 1865. In his hands the paper became a strong political power and an instrument in breaking the Tweed ring. For many years he was a strong leader in the Democratic Party and a close friend of Samuel J. Tilden. Upon Grover Cleveland's inauguration as president in 1885, Manning was appointed secretary of the treasury, the affairs of which office he conducted with great ability. He resigned in 1887 as a result of ill health, though he was connected with several commercial and banking enterprises until his death in the same year.

MANNING, Henry Edward, English cardinal: b. Totteridge, Hertfordshire, July 15, 1808; d. London, Jan. 14, 1892. The youngest son of a West India merchant and director of the Bank of England, Manning studied at Harrow and in 1827 matriculated at Balliol College, Oxford, where he was an outstanding debater. When he left the university in 1830, W. E. Gladstone succeeded him as president of the Union. He held a clerkship in the Colonial Office for two years, then (1832), having determined to enter the church, returned to Oxford, was elected fellow of Merton College, and ordained. The following year he was presented with the rectory of Lavington-with-Graffham in Sussex, and married the granddaughter of the donor of this living. When in 1837 his beautiful wife died of consumption, the tragedy made a permanent mark on the young cleric. Adopting the austere tenets of the Tractarians, he moved ever closer to High Church views, a year later for the first time visiting Rome. He had already achieved a reputation for devotion and eloquence when, in 1841, he was made archdeacon of Chichester. Newman's secession from the Church of England occurred in 1845; in 1848 Manning had public and private audiences with the pope, and his private papers indicate that he was already considering the possibility of taking the same step. However, it was not until the autumn of 1850 that the popular outcry against reestablishment of the Roman Catholic hierarchy in England determined him to resign his rectorship and archdeaconry. He was received into the Roman Catholic Church in April 1851 and within ten weeks was ordained priest by Cardinal Wiseman. He now proceeded to Rome for theological studies and was warmly received by the pope who personally conferred on him the degree of D.D. in 1854, and in 1857 appointed him provost (head) of the chapter of Westminster. For eight years he lived at Bayswater as superior of the Oblates of St. Charles, secular priests, and became Cardinal Wiseman's indispensable assistant. Among English Roman Catholics he was regarded as head of the Ultramontane party. On Wiseman's death in 1865 he succeeded him as archbishop of Westminster. His powerful advocacy of papal infallibility, especially at the Vatican Council of 1869–1870, gained him wide fame. On March 15, 1875 he was created cardinal by Pope Pius IX. A zealous prelate, he was a strict teetotaler from 1872. His devotion to the cause of the working man led to accusations that he was a Socialist.

Consult Hutton, A. W., *Cardinal Manning* (1892); Purcell, E. S., *Life of Cardinal Manning,* 2 vols. (1895); Taylor, I., *The Cardinal Democrat* (1908).

MANNING, James, American Baptist clergyman and first president of Brown University: b. Piscataway, N. J., Oct. 22, 1738; d. Providence, R. I., July 29, 1791. Graduated from the College of New Jersey (Princeton) in 1762, he settled in Warren, R. I., in 1764 where he became pastor of a Baptist church and also opened a Latin school which seems to have been the germ of Rhode Island College. The latter was granted a charter in 1764, and the next year Manning was appointed president of the institution which was later to move to Providence and become known as Brown University (q.v.). He resigned the presidency in 1790.

Consult Guild, R. A., *Early History of Brown University, Including the Life, Times, and Correspondence o President Manning* (1897).

MANNING, Robert, American pomologist: b. Salem, Mass., July 18, 1784; d. there, Oct. 10, 1842. He established a pomological garden at Salem in 1823 with the purpose of establishing the identity and classifying the various varieties of fruit. His efforts accomplished a great public benefit in introducing to general use the best varieties of fruit and in standardizing the nomenclature. At the time of his death his fruit garden contained more than 1,000 varieties of pears and many hundreds of apples, peaches, plums, and cherries. Largely through his efforts the Massachusetts Horticultural Society was established and he was a generous contributor to its support. He was an uncle of Nathaniel Hawthorne. Author of *Book of Fruits* (1838).

MANNING, William Thomas, American Protestant Episcopal bishop: b. Northampton, England, May 12, 1866; d. New York City, Nov. 18, 1949. Educated at the University of the South, Sewanee, Tenn., he was ordained deacon in 1889 and priest in 1891. After serving as rector of Trinity Church, Redlands, Calif., he returned to his alma mater where he taught dogmatic theology (1893–1895). The latter year he married Florence Van Antwerp of Cincinnati, Ohio. Subsequently he held rectorships in Landsdowne, Pa., and Nashville, Tenn. Appointed vicar of St. Agnes' Chapel of Trinity Parish in 1903, he became rector of Trinity Church in 1908. Charged with the direction of the wealthiest, most influential, and one of the oldest parishes in the United States, he displayed an exceptional capacity for administration, and several times declined offers of bishoprics in the West. On the death of the bishop of New York, he was prominent among several candidates for the post. The violent campaign against his election, led by yellow journals in New York which alleged his unfitness for the exalted office because of his English birth, failed; he was elected by overwhelming vote and consecrated on May 11, 1921. An uncompromising enemy of divorce, he was often involved in controversies. He declared Judge Ben B. Lindsey's advocacy of companionate marriage was propaganda for "unrestrained sexual gratification," assailed King Edward VIII for abdicating the throne to marry a divorcee, and barred a twice-divorced son of President Franklin D. Roosevelt from serving as vestryman of the church at Hyde Park, N. Y. In 1940 he was chiefly instrumental in voiding the appointment of the English philosopher Bertrand Russell to the faculty of the City College of New York, branding him a "defender of adultery and disbeliever in God." Yet the stern moralist was, in the opinion of many parishioners, far too much of a liberal. He accepted evolution and other

scientific tenets, opened the pulpit of the Cathedral of St. John the Divine to clergymen of other denominations, and supported many of President Roosevelt's social and economic reforms. In both world wars he roundly condemned "sentimental pacifism" and urged the adoption of selective service in 1940. At the age of 80 he retired, Dec. 31, 1946. A short, slender man with ascetic features and penetrating glance, he was a militant churchman of the old tradition. He made many enemies but was loved by the large circle who admired his courage, nobility of character, and kindliness.

MANNING, town, South Carolina, seat of Clarendon County, altitude 90 feet; 17 miles southeast of Sumter, on the Atlantic Coast Line. Agricultural products include tobacco, cotton, and sweet potatoes. Government is by mayor and council. Pop. (1940) 2,381; (1950) 2,775.

MANNINGTON, city, West Virginia, in Marion County; altitude 974 feet; 55 miles southeast of Wheeling, on the Baltimore and Ohio Railroad. The region produces a variety of farm crops and has rich deposits of coal, building clay, oil and gas. Manufactures include pottery, glassware, and tools. The city was incorporated in 1871. Pop. (1950) 3,241.

MANNITOL, a white crystalline compound, also known as mannite, having the formula $C_6H_8(OH)_6$. It is a hexatomic alcohol obtained from manna ash (see MANNA), and from many other plants. It has a sweet taste and resembles sugar. It is used as a mild laxative, as a chemical reagent, and as an ingredient of explosive caps.

MANNLICHER, män'lĭ-kĕr, **Ferdinand,** Austrian engineer and inventor: b. Mainz, Germany, Jan. 30, 1848; d. Vienna, Jan. 20, 1904. He was chief engineer of the Northern Railroad for many years. After the success of the needle gun at the Battle of Sadowa (Königgrätz) in 1866, he began experiments that ultimately produced a breech-loading repeater rifle which was adopted by the Austrian Army in 1885. He became famous for his numerous inventions in small arms and was elected to the upper house of the Austrian Parliament in 1899 in recognition of his distinguished services.

MANNY, măn'ĭ, or **MAUNY,** mō'nĭ, **Sir Walter de** (BARON DE MANNY), English military commander: b. medieval county of Hainaut; d. London, 1372. His memory is perpetuated as the founder of Charterhouse (q.v.), London, and by his military exploits as recorded by his friend Jean Froissart in his *Chronicles.* Scion of a noble family of Hainaut, it is believed that he arrived in England in 1327 in the train of Queen Philippa. He rose to high rank in the Scottish wars of Edward III, became a commander of the English fleet and of the army in France, and both in military commands and in diplomatic negotiations received the commendation of the king. He was created a baron and Knight of the Order of the Garter, and in 1335 married Margaret, the countess (later the duchess) of Norfolk.

MANNYNG, măn'ĭng, **Robert** (ROBERT OF BRUNNE, brōōn'nĕ), English chronicler and poet: flourished 1288–1338. He was born in Brunne (now Bourne), Lincolnshire, and entered the Gilbertine monastery of Sempringham in 1288. His chief work is his *Handlyng Synne* (1303), a free and amplified translation into English verse of William of Wadington's *Manuel des Pechiez,* with such judicious omissions and excellent additions as made his verse much more entertaining than the original. The purpose of the book was to convey religious instruction to the people in the agreeable form of moral anecdotes. It is of great importance from the linguistic point of view as one of our best landmarks in the transition from the Early to the Middle English. He also wrote *The Story of Inglande,* a new version in octosyllabic rhyme of Wace's *Brut d'Angleterre,* and added to it a popular translation of the French rhyming chronicle by Peter of Langtoft of Bridlington. Mannyng deliberately wrote in English instead of French, in order to reach the common people, to give them the means "for to haf solace and gamen, in felauschip when tha sit samen [together]."

MANOMETER, mă-nŏm'ē-tĕr, an instrument for measuring the pressure exerted by gas or liquid. It may have many forms of which the mercurial barometer (q.v.) is one. One of the commonest designs for the measurement of pressures not greatly different from that of the atmosphere consists of a U-tube, one of whose legs is open to the air, while the other is in communication with the gas or liquid whose pressure is to be measured. The lower part of the U is filled with some nonvolatile liquid of known density, and the difference between the pressure of the fluid under examination and that of the atmosphere is found by observing the difference between the levels of the manometric fluid in the two branches of the U-tube. If the absolute pressure of the fluid is desired, it is necessary to add the atmospheric pressure to the differential pressure as read from the manometer. In rough work it may be sufficient to assume the atmospheric pressure to be 14.7 pounds per square inch; but in more refined observations the atmospheric pressure must be determined by reading the barometer simultaneously with the manometer. Mercury is commonly the liquid that is used in the U-tube, but when the differences in pressure that are to be read are very small, some less dense liquid may be used with advantage. Sulphuric acid is often employed in such cases; and where (as in the measurement of chimney draft) a slight amount of evaporation from the manometric fluid is unimportant, water may be employed. When the pressure to be measured materially exceeds one atmosphere, the siphon manometer, as just described, is modified by sealing one of the ends of the U-tube instead of leaving it open to the air. In this case the pressure is determined by observing the amount of compression that it produces in the air that is confined in the sealed arm of the siphon, by the manometric fluid; for it is known by Boyle's law, that the volume of the air in this arm is sensibly proportional to the reciprocal of the absolute pressure, so long as the temperature remains constant. Boyle's law is not rigorously exact, however, and when a high degree of precision is required from the compression manometer, it is necessary to make allowances for its error. Data for this purpose have been given by Amagat, up to 85 atmospheres, when the temperature of the manometer is maintained at 16°C. (60.8°F.). Consult

Amagat, 'Comptes Rendus,' Vol. XCIX, p. 1153; Preston, 'Theory of Heat,' p. 403). In steam engineering the commonest form of manometer is the "Bourdon gauge," which depends for its action upon the elastic deformation of a flattened metallic tube when exposed to an internal pressure. In practice the flattened tube is bent into a circular form, one end of it being fixed while the other communicates, by means of a multiplying gear, with an index hand which travels over the face of a graduated dial. A tube so constructed straightens out slightly when subjected to an internal pressure, returning again to its original form when the pressure is removed. The deformation is approximately proportional to the magnitude of the pressure (so long as the tube is not strained beyond its elastic limit), and hence the dial may be graduated, without difficulty, so as to indicate true pressures, at least to a degree of precision quite sufficient for the purposes of steam engineering. All such gauges should be carefully compared with a standard mercury column, however, before great reliance is placed upon them; for it is found that they are sometimes seriously in error in some parts of the scale, even when sensibly correct in other parts. In using them in connection with steam boilers, care should also be taken to prevent steam or highly heated water from coming into direct contact with the curved tube, since the elastic properties of the tube are injured by overheating. To ensure the proper protection of the gauge, a siphon, or a complete circular bend, should be placed in the pipe between the gauge and the boiler. The trap so formed will fill with water of condensation the first time the boiler is fired up, and thereafter it will be impossible for steam to enter the gauge directly.

MANON LESCAUT, a short novel of 200 pages, the seventh volume of a larger work, "Memoirs of a Nobleman," has sufficed to assure the reputation of its author, Prévost d'Exiles (1697–1763), better known as L'Abbé Prévost. After a life of adventure in France, England, Holland and Germany when he was in turn soldier, monk, journalist, teacher and later chaplain of the Prince of Conti, Prévost became a professional writer and composed more than 100 volumes. He also translated many English works, and among those, his adaptations rather than translations of 'Pantela,' 'Clarissa Harlowe' and 'Grandison' gave to Richardson a great popularity in France during the second half of the 18th century, to the detriment of Prévost's own works. Of all Prévost's novels, critical articles in the periodical *Pro and Con* and pseudo-scientific travel stories, Manon Lescaut alone survives. Published in Holland in 1731, it "took like wild fire" according to contemporary testimony and more than 30 editions were printed before the end of the century, that of 1753 revised and corrected by the author being considered as the best. This novel is the story of the passionate love of the young Chevalier des Grieux for the courtesan Manon. It is told in a simple narrative style and with a sincerity which leads us to believe that Prévost relates at least in part some episodes of his stormy life. The novel presents a realistic and painful picture of the sufferings which uncontrolled passion brings upon those who lack the will power to resist it, and while Prévost does not attempt to excuse or justify the faults of his heroes, he shows passion as a terrible force whose victims are to be pitied rather than blamed. Prévost had many imitators even in his own time, and the theme of Manon, dealing with rehabilitation through love and sufferings, is found later in 'Marion Delorme' (Hugo), 'La Dame aux Camélias' (Dumas), 'Sapho' (Daudet) and in the works of several Russian novelists.

Louis A. Loiseaux.

MANOR (old French *manoir, maneir,* from L. *manere,* to remain, being the residence of the owner), a piece of territory held by a lord or great personage, who occupied a part of it, as much as was necessary for the use of his own household, and granted or leased the remainder to tenants for stipulated rents or services. No manors, with all their incidents and franchises, have been granted in England since the reign of Edward III. One of the most important incidents to these ancient manors was the right to hold a court, called a *court-baron,* which was held within the manor, and had jurisdiction of misdemeanors and nuisances within the manor, and disputes about property between the tenants. The manor system was in vogue in the United States only during the British occupation, but many old manor names like Briarcliffe manor, Pelham manor, etc., are still retained by the present owners of large estates. See also Tenure.

MANOURY, General. See Maunoury.

MANRIQUE, mạn-rē-kā, **Angel,** Spanish poet and ecclesiastic: b. Burgos, 1577; d. Badajos, 1649. He rose to high rank in monastic life, becoming finally head of the Cistercienses throughout Spain, and finally bishop of Burgos (1645). He wrote a history of the Cister order which had considerable reputation throughout Europe. He also wrote many devotional and other works of a religious or religio-historical nature.

MANRIQUE, Gómez, Spanish poet and dramatist: b. about 1415; d. 1491. He was son of Pedro Lord of Amusco, and a younger brother of Rodrigo Manrique, master of Santiago and one of the troubadours of the court of John II. He became a soldier of some note and took part in wars against the Moors. He sided with the Infante, Don Enrique, against Alvaro de Luna and the royal court. He was very active and seems to have taken part in almost every political disturbance and warlike expedition of Spain in his day. He was very much mixed up in the political move which forced the marriage of Ferdinand of Aragon and Isabel of Castile, which was of great significance since it ultimately led to the expulsion of the Moors from the country and the political and national unity of all Spain. He attained to numerous high offices under the king of Aragon and later under the united crowns of Castile and Aragon, becoming finally a member of the royal council and the confidant of the joint sovereigns. Gómez Manrique, notwithstanding his tempestuous and warlike life, was one of the greatest orators of his age and a talented poet. He was one of the set of writers who sang the glories of the Virgin Mary and their love for and devotion to her. He was a satirist with a keen sense of humor, and he attempted nearly every class of literature known in his day in Spain.

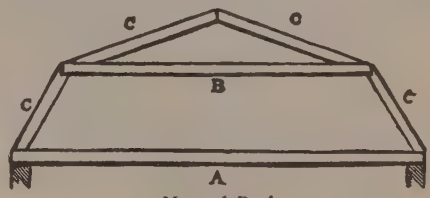
He played his part in helping to introduce into Spanish poetry the poetical forms of Italian literature. He also wrote religious dramas in the form in which they appeared in his age. For this reason and for the fact that he introduced more than customary life into these dramatic pieces, his work had considerable influence on the development of the drama, both religious and, subsequently, profane, in Spain. The best of his religious dramas, all of which are of a liturgical caste, is 'Representacion del nacinùento de Nuestro Señor.' He also wrote on political and philosophical subjects and on matters of ethics and vices such as gluttony, envy, laziness, and of virtues, such as reason (in human actions), faith, prudence and honesty of purpose in government. His poem on the death of the Marques de Santillana became immensely popular and Gómez Manrique rose to be the most quoted writer and most recited lyrical poet of his day. His 'Cancionero' has been published several times and poems of Gómez Manrique have appeared in various other cancioneros. Consult Menéndez y Pelayo, Marcelino, 'Antologia de poetas liricos castellanos' (Vol. VI, Madrid 1886); Pas y Melia, A., 'Cancionero de Gómez Manrique' (Madrid 1885); Ríos, Amador de los, 'Historia critica de la leteratura española.'

MANRIQUE, Jorge, Spanish poet: b. about 1440; d. 1479. He was son of Rodrigo Manrique, grand master of Santiago. He early took a prominent part in the troubles of the reign of Henry IV, taking sides with Don Alfonso. Notwithstanding the fact that most his life was passed in active military duty and that he died in battle in the attack on the fortress of Garci-Muñoz, he yet attained such an eminence as a poet that he is still classed among the great writers of Spain, and a worthy nephew of Gómez Manrique (q.v.) and heir of his father, Rodrigo Manrique, who was one of the successful troubadours at the court of John II, one of the foremost patrons of lyrical poetry. Jorge Manrique has written satires, love songs and poems of a like nature common to the age in which he lived; but his most noted poem and the one to which he owes his lasting fame is 'Coplas de Jorge Manrique por la muerte de su padri.' This is one of the finest lyrics in the Spanish language, instinct with true poetic form and thought and sympathy. This poem has been imitated and praised by some of the greatest writers of Spain and it has found universal favor in the eyes of the critics. Longfellow has made a worthy translation of it into English; and it was set to music as far back as the 16th century by Venegas de Henestrosa. (See COPLAS DE MANRIQUE; ROMANCERO DEL CID). Consult Longfellow's translation and Fitzmaurice-Kelly, James, 'A History of Spanish Literature' (New York 1898); Menéndez y Pelayo, Marcelino, 'Antología de poetas líricos castellanos' (Vol. VI, Madrid 1896); *Biblioteca de autores españoles* (Rivadeneira, Vols. XXXII and XXXV) contains his works and notices thereof.

MANS, mäñ, **Le,** France, the capital of the department of Sarthe, on a height above the Sarthe, here crossed by three bridges, 115 miles southwest of Paris. It consists of a lower and an upper town. The principal edifice is a fine Gothic cathedral of the 11th century. It has a seminary, excellent schools, a public library of 60,000 volumes and several museums. The chief manufactures are metal works, railway cars, tobacco, canned goods, chemicals, cordage, leather and woolen and linen goods; being a railway centre it is a distributing point for farm produce, canned goods, wines, etc. Le Mans existed in the time of the Romans under the name of Cenomani, a tribe who inhabited the district. Numerous vestiges of Roman structures (subterranean aqueducts, walls, etc.) still remain. It was long in the possession of the English, and Henry II, the first Plantagenet, was born here. During the Franco-German War (1870–71) General Chanzy was defeated here by Prince Frederick Charles and the Grand-duke of Mecklenburg. A monument commemorates the battle. Pop. about 73,000.

MANSARD, mäñ-särˊ, or **MANSART, François,** fräñ-swä, French architect: b. Paris, 23 Jan. 1598; d. there, 23 Sept. 1666. He designed many important buildings in Paris, as well as provincial chateaux and country seats. The chateaux at Blois are partly his work, and he built the church of Val de Grâce and the Hotel Carnavalet. The mansard roof is called after him.

MANSARD ROOF, *in architecture* (so called from François Mansard, or Mansart (q.v.), a French architect to whom the invention is attributed), a roof formed of two sets of rafters, of which the upper set are more inclined to the horizon than the lower set, and



Mansard Roof.

form an obtuse angle at the ridge. The transverse beams connecting the lower ends of the under set of rafters are called as in ordinary roofs tie-beams; the corresponding beams at the union of the upper and under rafters are called collar-beams.

MANSART, Jules Hardouin, zhül ärˊ-dooˊäñ mäñ-särˊ, French architect: b. Paris, 16 April 1645; d. Versailles, 11 May 1708. He was a nephew of François Mansart, or Mansard (q.v.). He directed all the great building operations of Louis XIV, who heaped favor and wealth upon him. His works include the palace at Versailles; the Maison de Saint-Cyr; the Grand Trianon; the triple dome of the Invalides, and the Chateau de Clagny, the residence of Madame de Montespan. He also designed the Place Vendôme and the Place des Victoires.

MANSE, *in Scotch law,* a name given the dwelling-house of the minister of the Established Church. In popular use the term is often applied generally to the dwelling-house of any minister of a dissenting congregation. In the Established Church every first minister of a rural parish is entitled to a manse, which the heritors or landed proprietors in the parish are bound to build and uphold. When a manse has

been built or repaired by the heritors it becomes a free manse, and all ordinary repairs have to be done at the charges of the minister.

MANSEL, Henry Longueville, English logician and theologian: b. Cosgrove, Northamptonshire, Oct. 6, 1820; d. London, July 31, 1871. He was educated at Saint John's College, Oxford, and took orders in the Anglican Church in 1845. He became Wayneflete professor of philosophy at Oxford in 1859; regius professor of ecclesiastical history, 1867, and dean of Saint Paul's, London, 1868. He was made a canon of Christ Church, Oxford, in 1867.

MANSFELD, mäns'fĕlt, **Peter Ernst I,** COUNT, Austrian general and statesman: b. July 15, 1517; d. Luxemburg, May 22, 1604. He became governor of the Low Countries after the death of the Duke of Parma.

MANSFELD, Peter Ernst II, COUNT, German Protestant military leader: b. Luxemburg, 1580; d. Racowitza, Bosnia, Nov. 29, 1626. He was a natural son of the preceding, but, disappointed in regard to the inheritance of his father's lands, joined the Protestant princes and became the bitter enemy of Austria. He gained a victory over Tilly at Wiesloch in 1622, but was defeated by Wallenstein at Dessau in 1626, and died soon after.

MANSFIELD, mănz'fēld, **Edward Deering,** American author: b. New Haven, Conn., Aug. 17, 1801; d. Morrow, Ohio, Oct. 27, 1880. He was graduated at West Point in 1819 and at Princeton in 1822 when he took up the study of law and was admitted to the bar in 1825. He went to Cincinnati to engage in practice until 1835 when he accepted the chair of constitutional law and history in Cincinnati College. He resigned to enter journalism and was editor of the *Cincinnati Chronicle,* the *Atlas* and the *Railroad Record.* For many years he was a contributor to New York newspapers under the title "Veteran Observer."

MANSFIELD, Joseph King Fenno, American soldier: b. New Haven, Conn., Dec. 22, 1803; d. near Sharpsburg, Md., Sept. 18, 1862. He was graduated from West Point in 1822 and in the Mexican War became chief engineer under General Taylor. He took an active part in the engagements at Fort Brown, Monterey and Buena Vista. In 1853 he was appointed inspector general of the United States Army and served in that capacity until 1861 when he was made brigadier-general and given command of the Department of Washington. He was in command of a corps of the Army of the Potomac at Antietam and was killed there.

MANSFIELD, Katherine (pseudonym of KATHLEEN, nee BEAUCHAMP, bē'chăm, MURRY), British writer: b. Wellington, New Zealand, Oct. 14, 1888; d. Fontainebleau, France, Jan. 9, 1923. She lived most of her early childhood in the small township of Karori near Wellington. At 14, she went to London to school and, except for a two-year visit in New Zealand, spent the remainder of her life in Europe. Her first short stories were published in small literary magazines. Upon the publication of her volumes of short stories, *Bliss* in 1921 and *The Garden Party* in 1922, it was immediately recognized that hers was one of the rare talents of 20th century literature. She was married twice, to George Bowden in 1909, whom she divorced, and in 1918 to John Middleton Murry, the English critic. Because of poor health she spent considerable time in the south of France and died at thirty-five from tuberculosis.

In her stories, Katherine Mansfield disregarded plot to relate simple, meaningful incidents with a sensitivity and a masterful sense of character delineation that have seldom been equalled. The stories are admired and loved for their warm, sympathetic quality and an undertone of heartbreak. In *The Doll's House* she uses a plaything to show the natural cruelty of children and the domineering social attitudes of adults. In *The Garden Party* she tells of an adolescent's first experience with death, at the close of what had been an idyllic summer's day. *A Cup of Tea* is a study of the mixed emotions of a vain young wife who would like to be charitable. In *Bliss* she shows that a blooming pear tree can overpower a woman with its beauty and then in an instant become a symbol of silent mockery.

Her best known stories can be found in innumerable anthologies; her husband, J. Middleton Murry, has edited biographical material, including: *The Journal of Katherine Mansfield* (1927); *The Letters of Katherine Mansfield* (1928); and *The Scrapbook of Katherine Mansfield* (1939). See also NEW ZEALAND LITERATURE AND ART; ENGLISH LITERATURE, TWENTIETH CENTURY—*Fiction.*

MANSFIELD, Richard, American actor: b. Heligoland, May 24, 1857; d. New London, Conn., Aug. 30, 1907. He first studied art, opening a studio in Boston, but later returned to England and entered the theatrical profession. He played small parts in comic opera, and first appeared in America as Dromez in *Les Manteaux Noires* at the Standard Theatre, New York. He afterward was very successful in a wide variety of plays and became the head of his own company. He created such parts as Beau Brummel, Baron Chevrial, Dr. Jekyll and Mr. Hyde, and Monsieur Beaucaire; among his other most successful rôles were Cyrano de Bergerac, Shylock, Henry V, Brutus, and Peer Gynt.

MANSFIELD, William Murray, EARL OF, British jurist: b. Scone, Scotland, March 2, 1705; d. London, March 20, 1793. One of the youngest sons of 5th Viscount Stormont, he was educated at Christ Church, Oxford; studied law; was called to the bar in 1730; won a large Scottish practice and many literary friends, the foremost being Alexander Pope. In 1742 he was made solicitor general and entered Parliament. Though of Jacobite descent he upheld the Hanoverian interest in 1745, did special service in 1748 by his defense of the Treaty of Aix-la-Chapelle, and was admitted leader of the House. An attempt to prove him guilty of treason or disloyalty to the Crown was unsuccessful, although often repeated. He was made attorney-general in 1754 and chief justice and Baron Mansfield in 1756. He became Earl of Mansfield in 1776; proposed the coalition of 1779, and in 1780 suffered at the hands of the Gordon rioters because of his sympathy with Catholic emancipation. In 1788 he retired from the bench. Although unpopular and constitutionally a believer

in royal prerogative, Mansfield was a great judge, whose work was not too conservative, and an able, calm, logical debater. Possibly his greatest labor was his revision of the mercantile law.

MANSFIELD, town, Connecticut, is located on the Willimantic River about 20 miles east of Hartford in Tolland County. Settled in about 1692, it was incorporated in 1703 and is now important as an agricultural and manufacturing center, its chief industrial products being fiberboard and silk. The village of Storrs, a subdivision of the town, is the location of the coeducational University of Connecticut established in 1881. Pop. (1940) 4,559; (1950) 10,008.

MANSFIELD, market town and municipal borough, England, is located on the site of a Roman camp in Nottinghamshire, 15 miles north of Nottingham, in the midst of a rich coal district, surrounded by the vestiges of Sherwood Forest. Iron, shoes, hosiery, textiles, metal products, and chemicals are produced here. A grammar school founded in 1561 still stands. Pop. (1951) 51,343.

MANSFIELD, town, Louisiana, seat of De Soto Parish, is located 34 miles south of Shreveport at an altitude of 330 feet. Served by the Kansas City Southern Railroad, it is an agricultural and shipping center. Its industries include lumber mills, cotton ginning, a trailer factory, and a steel foundry. The site of the Battle of Sabine Crossroads (April 8, 1864) is now a nearby park. Incorporated in 1847, the town is governed by a mayor and council. Pop. (1950) 4,440.

MANSFIELD, town, Massachusetts, is an agricultural and industrial center located in Bristol County 24 miles southwest of Boston on the New York, New Haven and Hartford Railroad, at an altitude of 180 feet. Long an industrial town, its products include chemicals, jewelry, machine parts, metal products, and chocolate. It was settled about 1659 and incorporated about 1775. Pop. (1950) 7,184.

MANSFIELD, city, Ohio, seat of Richland County, is an industrial center located in the midst of a rich agricultural region about 55 miles southwest of Akron at an altitude of 1,155 feet. Served by the Baltimore and Ohio, Erie, and Pennsylvania railroads, its industrial products include aircraft parts, electrical appliances, brass, sheet steel, tin plate, machinery, rubber goods, plumbing fixtures, heating apparatus, and farming implements. The Ohio State Reformatory is located in Mansfield. The city was named in honor of Jared Mansfield, surveyor general of the United States, under whose direction it was laid out in 1808. It was incorporated as a village in 1828 and as a city in 1857. It has a mayor-council type of government. Pop. (1940) 37,154; (1950) 43,564.

MANSFIELD, borough, Pennsylvania, in Tioga County, is situated 24 miles southwest of Elmira, N. Y. on the Tioga River at an altitude of 1,120 feet. It is in a farming and dairying, bituminous coal, and natural gas area and is noted for its manufacture of novelties. The coeducational Mansfield State Teachers College is located here. The site, cleared as a field by Asa Mann in 1804 and known as "Mann's Field," later became a village and was incorporated in 1857 Pop. (1950) 2,657.

MANSFIELD, Mount, is located in north central Vermont about 20 miles northeast of Burlington in the midst of a winter sports and summer resort recreational area. At 4,393 feet, it is the highest peak of the Green Mountains (q.v.) of Vermont. A scenic feature is Smugglers Notch, a gorge at the base. At the summit is a hotel, built about 1860.

MANSFIELD PARK. This quietly charming novel of manners, published in 1814, is perhaps less popular than some of the other works of Jane Austen, but it is regarded by more than one critic as even superior to them in richness and maturity. As the title implies, the story is built around English country-house life. Fanny Price, an indigent niece, is taken into the family of Sir Thomas Bertram. Overlooked for the most part by Sir Thomas and his wife, subjected to the carping control of the odious Mrs. Norris, Lady Bertram's sister, and neglected or patronized by three of her cousins, Fanny finds her chief consolation in the casual kindness of her remaining cousin, Edmund, whom she grows to love. But Edmund is attracted by the dashing and sophisticated Mary Crawford, who with her brother, Henry, is visiting at the neighboring rectory. Henry, in turn, after various flirtations with the Bertram sisters, pays suit to Fanny. The unfolding of these several relationships by means of seemingly insignificant incidents—dances, excursions, amateur theatricals—constitutes some of Miss Austen's most skillful work and affords her opportunity for those delicately humorous, mildly ironical accounts of the life she knew best, that have made her immortal. In the end, of course, Henry and Mary Crawford are eliminated, and Edmund loves and marries his Cinderella-like cousin. No single character in this novel is as well known as Mr. Collins of *Pride and Prejudice* or Miss Bates of *Emma;* yet the various personages are excellent examples of the author's nice discrimination and marvelous insight. Each character is clearly portrayed though not unduly simplified; each exhibits in varying proportions that mixture of good and evil common to all mankind. In a word, the characters are not types or Elizabethan "humors," but are richly human. *Mansfield Park* appeals to many classes of readers. It is the best kind of historical novel, for it records vividly the manners and customs of ordinary folk in the Napoleonic era. It is a superb example of a serene, balanced realism, avoiding alike the rose-pink and the dirty drab that Meredith later reprehended.

George B. Dutton.

MANSHIP, Paul, American sculptor: b. St. Paul, Minn., Dec. 25, 1885. He received his early education at the St. Paul Institute of Arts, where he evinced marked talent for sculpture, and later studied at the American Academy in Rome. His first achievement was the winning of the Helen Barnett prize, in the National Academy of Design in 1913, and he won this again in 1917. He was also awarded a gold medal at the San Francisco World's Ex-

position in 1915. His statues are to be seen in the Metropolitan Museum in New York, Pratt Institute, Brooklyn, Art Institute, Chicago, and other leading institutions.

MANSILLA DE GARCIA, Eduarda, ā-doo-är'dä män-sēl'yä dā gär-sē'ä, Argentine novelist: b. Buenos Aires, 1838. Her maiden name was Mansilla; at 16 she married Manuel R. García, a diplomat, and at 19 published 'El Médico de San Luis,' possibly her best novel. It was followed by 'Lucia Miranda,' a historical novel on the discovery of La Plata, and by 'Pablo, ó la Vida en las Pampas,' which with its fresh description of Argentine life made a great impression in Paris and was praised by Hugo. She was a musician of much talent and wrote, besides novels, several plays.

MANSION HOUSE, in London, England, the official residence of the lord mayor, built on the site of the Old Stock Market in 1739 from designs by George Dance, at a cost of $213,190. It is an oblong building and contains an Egyptian banquet hall accommodating 400 guests.

MANSLAUGHTER, the killing of a human being; in criminal law the second degree of felonious homicide. Murder and manslaughter are distinguished from each other by the intent which causes or accompanies the act. If a homicide be not justifiable nor excusable, and yet be not committed with malice aforethought, it is manslaughter and not murder. It is quite certain that the intent need not be to kill; for while there must be a criminal intent to make a person amenable to law as a criminal, yet if one crime be intended, and in the act of committing it another of a higher character be also committed without intent, the criminal is responsible for this higher crime. The general principle laid down in respect to manslaughter is, that not only a positive intention to commit some crime, but mere negligence, may make one guilty. If any one take upon himself an office or duty requiring care or skill, he is liable for the want of either; and if death be the consequence of his ignorance or carelessness, he is guilty of manslaughter. So if one driving furiously run over and kill a person whom he did not see, or if one in command of a steamer or sailing-vessel by reason of gross negligence run down a boat and some one in it be drowned, this would be manslaughter. So, if any one, whether medical by profession or not, deal with another as a physician, and through gross want of care or skill kill him, or if any one charged with building a house of any kind construct it so badly that it falls and kills persons within or near it; or if in building he drop a stone upon some one passing below and kill him; in all these cases he would be guilty of manslaughter, provided he were grossly negligent in the act causing the death. This is the essential question.

Blackstone defines manslaughter thus: "Manslaughter is the unlawful killing of another without malice either express or implied; which may be either voluntarily, upon a sudden heat, or involuntarily, but in the commission of some unlawful act."

The judicial treatment of this crime, being regulated by statute, varies in the several States. The element of premeditation is not essential to conviction of this crime. There are cases which the law regards as only manslaughter, without evidence of momentary excitement; partly because the law infers that from such a provocation there must be excitement; and partly, perhaps, because the party killed brought his death upon himself by his outrageous wrong. Thus, if a husband detects his wife in adultery, and instantly and purposely takes either her life or the adulterer's, it is only manslaughter. Not so, however, if he waits for a subsequent opportunity, for then the first reason wholly fails, and the killing becomes murder.

In New York State four degrees of manslaughter are defined. The first carries a penalty of not over 20 years' imprisonment, the second degree not over 15 years. The first degree, briefly stated, consists of killing without the purpose of death, when the deceased was engaged in perpetrating or attempting a crime less than felony, and where such killing would be, at common law, murder. Assisting in self-murder is manslaughter in the first degree, as also wilfully killing an unborn quick child by injury to the mother if it would be murder in case the mother died from the injury. The second degree consists in procuring abortion otherwise; killing in the heat of passion without the intent of death, but in a cruel and unusual manner; or killing unnecessarily one attempting to commit felony. The third degree is killing in heat of passion, without intent of death, but with a dangerous weapon; involuntary killing, by procurement or negligence of another, while the person killed is engaged in committing a trespass on property; suffering an animal known to be mischievous to go abroad without care, or keeping it without care, and thereby causing death; receiving wilfully or negligently so many persons in a boat or vessel as to cause death; racing while in command of a steamboat carrying passengers, bursting the boiler, and so killing; killing by a physician while in a state of intoxication. The fourth degree may be said to include all other modes or forms of manslaughter, known as such at common law, and of a milder kind than the preceding. There is much difference between the States in the penalties prescribed. Some States, as Louisiana, Maine and Maryland, assign "not over 20 years" to both first and second degree manslaughter, thus practically leaving the penalty to the judge's discretion; other States, as New Hampshire and South Carolina, call for "not over 30 years," while Texas, West Virginia and Delaware place five years as the greatest punishment. Several States make second degree manslaughter "not over one year" in prison. See HOMICIDE.

MANSURA, MANSURAH, or MANSOURAH, män-soo'rä, Egypt, a town on the Damietta branch of the Nile, 34 miles southwest of Damietta. It has railway connection with Zagazig and Cairo and is the chief depot of the bread-stuffs, cotton, indigo, hemp and flax which this part of the Delta produces. There are also linen and cotton manufactories, etc. Mansurah was founded in 1221 and here in 1250, during the Crusades, Louis IX of France was captured and imprisoned. Pop. about 64,000.

MANTA, män'tä, Ecuador, city, port of entry on the Pacific Coast, about 155 miles southwest of Quito. It has an excellent harbor and steamer connection with nearly all the Pacific

Coast towns of South America. It was founded as early as 1534–35, and for many years its importance has been in being the port of Monticristi, which is about 10 miles inland. The chief exports are coffee and rubber. Pop. 8,000.

MANTALINI, măn-tą-lē'nē, a low and affected character in Dickens' 'Nicholas Nickleby' who lives on the labors of his wife, mantuamaker.

MANTARO, män-tä'rō, a river in Peru which has its rise in the mountains in the western part of the province of Junin. Its source is about 13,000 feet above the sea. It flows south and east to Huanta, near which it breaks through the mountains and turns northwest which course is continued for about 60 miles, when again it changes and flows northeast to Pisquitini, where it joins the Apurimac River and forms the Ené. The Mantaro is nearly 300 miles long and navigable only a short distance above the junction with the Apurimac. It has extensive water power which is not used except in a few cities.

MANTEGAZZA, Paolo, pä'ō-lō män-tägät'sä, Italian author and physiologist: b. Monza, Italy, 1831; d. 1910. He was educated at the universities of Pisa and Milan, spent several years in traveling, visiting almost every portion of the globe, after which he returned to Milan and practised medicine there. He was appointed professor of physiology at Pavia in 1860 and in 1870 became professor of anthropology at Florence, where he founded the Museum of Anthropology, also a society and a review of anthropology. He was a member of the Italian Parliament 1865–76 and then became senator. He is the author of many medical and philosophical books; among them are 'Elementi d'igiene' (1875); 'Fisiologia del piacere' (1881); 'Le istasi umane' (1887); 'L'anno 3000' (1897); 'L'amore' (1898), etc. He has also written books of travel and has devoted a share of his attention to political affairs.

MANTEGNA, Andrea, Italian painter: b. Vicenza 1431; d. Mantua, 13 Sept. 1506. His master, Squarcione, was induced by the talents which he displayed to adopt him as a son. The youth employed himself principally in drawing from antiques, and at the age of 16 painted a picture for the grand altar in the church of Saint Sophia at Padua. About 1468 Mantegna entered the service of Ludovico Gonzaga, at Mantua, where he opened a school. Here he painted his great picture, the 'Triumph of Julius Cæsar,' for the tapestry of a palace erected in Mantua. It consists of several cartoons, which have since been transferred to Hampton Court. Gonzaga conferred on him the honor of knighthood in reward for his merit. Innocent VIII invited the artist to Rome to paint in the Belvidere. One of the best of this artist's works is the 'Madonna della Vittoria,' now in the Louvre at Paris, in which Giovanni Francesco Gonzaga is seen returning thanks for the victory gained by him in 1496 over the forces of Charles VIII. The genuineness of this picture is, however, sometimes doubted. There are several others of his works in the Louvre, and an 'Annunciation' in the Dresden Gallery. The New York Historical Society has his 'Crucifixion,' the Metropolitan Museum 'Holy Family,' the Johnson Gallery in Philadelphia his 'Adoration of the Magi.' He was also noted as a line engraver, and left many notable copper plates of both religious and historical subjects. Consult Bell, N. R. E., 'Mantegna' (New York 1911).

MANTELL, Gideon Algernon, English geologist: b. Lewis, Sussex, 1790; d. London, 10 Nov. 1852. For many years he practised as a medical man, and employed his leisure time in studying the strata and fossil remains of the weald district, by which he was surrounded. Through his investigations the fossilized skeletons of the Iguanodon and Hylæosaurus were discovered, the fresh-water origin of the wealden beds demonstrated and many other important facts established in regard to the geology of that district. He published 'The Fossils of the South Downs' (1822); 'Illustrations of the Geology of Sussex' (1822), and the very popular 'Wonders of Geology' (1838); and 'Medals of Creation' (1844). His magnificent collection of fossils was purchased in 1839 for the British Museum.

MANTELL, Robert Bruce, American actor: b. Irvine, Scotland, 7 Feb. 1854; d. 27 June 1928. He made his début at Rochdale, England, in 1876, and in 1878 played in juvenile rôles with Modjeska in the United States. He then spent three years in England as leading man, returning to New York to play with Fanny Davenport. He became a star and played at the head of his own company, presenting the leading classical and romantic rôles, including Hamlet, Macbeth, Romeo, Richelieu, etc.

MANTES, mänt, France, a town in the department of Seine-et-Oise, on the left bank of the Seine, opposite Limay, with which it communicates by two handsome bridges connecting the banks with an island in the river, 29 miles west-northwest of Paris. It contains a fine Gothic church, with two lofty towers; a beautiful Gothic tower, the only remains of the church of Saint Maclou; and has manufactures of tiles and baskets, famous breweries, numerous mills and a trade in leather, corn and wine. William the Conqueror received his death-wound at Mantes. Pop. 9,700.

MANTEUFFEL, măn'toif-fĕl, **Edwin Hans Karl,** BARON VON, German field-marshal: b. Dresden, 24 Feb. 1809; d. Karlsbad, 17 June 1885. He entered the army in 1827 and advanced rapidly, becoming lieutenant-general of cavalry 1861. He took part in the Danish War of 1864, and next year was appointed governor of Schleswig. During the war between Prussia and Austria he commanded the army of the Main, and fought at Hemstadt, Vettingen, Rossbrunn and Würzburg. He served with distinction in the Franco-German War, especially in several actions around Metz, at Amiens, and from June 1871 to July 1873 he commanded the army of occupation in France, and was made field-marshal. In 1879 he was appointed governor-general of Alsace-Lorraine, and in this capacity showed singular want of skill and tact in ruling a conquered people.

MANTI, măn'tī, Utah, city, Sanpete County seat, alt. 5,548 feet, on the Denver and Rio Grande Western Railroad, 126m. S. of Salt Lake City. It is situated in a sheep-raising region. Poultry and dairy products are handled. The city has a Carnegie library, a hospital, a

National Guard armory, and a county-city jail. There is a Mormon temple here; also, three Mormon churches and a Presbyterian church. The name Manti is taken from the *Book of Mormon.* Manti has a mayor and council; the city was founded by Mormons in 1849. Pop. (1950) 2,051.

MANTINEA, măn-t'n-ē'à, or **MANTINEIA,** ancient city, Arcadia, Greece; on the Argolis district border of the eastern Peloponnesus, on the Ophis River. Mantinea was known for its wealth, and famous for the battles fought near it; in 418 B.C., when the Argives, Athenians, and Mantineans were defeated by the Spartans; in 385 B.C., when the city was taken and destroyed by the Spartans; and in 362 B.C., when the Thebans under Epaminondas defeated the Spartans, although the victory of the Thebans was purchased with the life of their commander. Mantinea was, in 226 B.C., surprised by Aratus of Sicyon; and in 222 B.C. taken by Antigonus III Doson; on this occasion the town was sacked, and the inhabitants were sold as slaves. Another battle was fought near Mantinea 207 B.C., between Machanidas, tyrant of Lacedaemon, and Philopoemen, general of the Achaean League. The latter was victorious, and slew the tyrant with his own hand.

The French school at Athens financed an archaeologist, G. Fougères, in uncovering a large area here in 1888. The ancient city was walled, with towers about 80 feet apart. A large mound-shaped theater was disclosed, a square market hall, and paved roads of different eras.

Consult Fougères, G., *Mantinée et l'Arcadie Orientale* (Paris 1898).

MANTIQUEIRA, mann-tê-kā'ê-rà, **Serra da,** mountain range, Brazil, which is in the southeastern part of the republic and is about 75 miles from the Atlantic Ocean and extends nearly parallel with the coast for about 200 miles. The eastern end is near Rio de Janeiro. Ranges connected with the Mantiqueira are often included with this range and the name Mitiqueira applied to the whole. Mount Itatiaía, the highest peak, is 9,145 feet above the sea. Several large rivers have their sources in this range.

MANTIS, an orthopterous insect of the family Mantidae. These curious insects, allied to grasshoppers, abound in many parts of the world, and have always excited popular notice, and have been endowed with many supernatural qualities by the ignorant and superstitious of all countries. They are slender, with long, locust-like legs, oval wings, and a long necklike prothorax, terminating in an angular head with large protruding eyes. The front legs are stout, spiny, fitted for grasping their prey, and are held up in front of them in an attitude that to some suggest prayer. Hence the names praying insect, prophet, and the like often given to the more familiar species; to others they suggest other ideas, as of a horse pawing the air, whence our common species of the southern states (*Stagomantis carolina*) is known as the rearhorse, and in Europe these insects are called camel crickets. Why it should also be called mule killer is harder to explain; probably it is by confusion with a scorpion also so called.

These insects in tropical countries have come to assume various forms and hues similar to the flowers near which they lurk to catch the insects visiting the blossoms—a protective measure which comes under the head of mimicry. A large proportion of the insects upon which they feed are injurious to crops, hence the mantis may be regarded as beneficial to man. Among the Japanese and Chinese they are made to minister to human amusement also, being kept in cages and made to engage in combats upon which the spectators bet money. The eggs of the mantis are laid in an oval mass upon the stem of a plant and covered with a tough case of hardened mucus which shows a curiously braided pattern of surface and is easily recognized.

MANTIS SHRIMP, a large crustacean (*Squilla empusa*) of the order Stomatopoda, which dwells in burrows between tidemarks along the Eastern coast of the United States, and seizes marine worms, and the like, that come within its reach. Its general shape is shrimplike, but it has strong claws on the second pair of legs, which much resemble the forelegs of a mantis (q.v.), are provided with sharp spines, and are so joined that they can be folded back upon themselves like the blade of a clasp knife, and so take a firm grip upon the struggling captives. It is quite blind, although the eyes appear to be well formed. A well-known European species is gathered for food by the coast people.

MANTLE (1) a kind of cloak or loose garment to be worn over other garments. (2) *In heraldry* see MANTLING. (3) A fabric-like covering of salts easily rendered incandescent, for placing over a gas flame to increase the light diffused. See also GAS ILLUMINATION, HISTORY OF.

MANTLE-ROCK (also called Regolith), the loose unconsolidated debris that results from rock weathering. It includes all soils except those of strictly organic origin. If they have resulted from weathering in place, without removal, the soils are called residual; if they have been carried from their place of origin by wind, glaciers, or running water, they are said to be transported. The mantle-rock varies greatly in thickness. In some places it is entirely absent, in others it is hundreds of feet deep. See also SOIL.

MANTLING, *in heraldry,* an ornament depicted as hanging down from the helmet, and behind the escutcheon. It is considered to represent either the cointise, an ornamental scarf which passed around the body, and over the shoulder; or the military mantle, or robe of estate. When intended for the cointise, it is cut into irregular strips and curls of the most capricious forms, whose contortions are supposed to indicate that it has been torn into that ragged condition in the field of battle. When the mantling is treated as a robe of estate, the bearings of the shield are sometimes embroidered on it. A mantling adjusted so as to form a background for the shield and its accessories constitutes an "achievement of arms."

MANTRAPS, metal traps formerly used on the grounds of large estates in England to catch poachers and trespassers. The grounds were often posted with the warning notice, "Man-traps and spring-guns set here." Designed with sharp teeth to clutch and hold the leg of anyone caught in them, in appearance they resembled gigantic rat-

traps several feet long. They may be seen in museums; it has long been illegal to set them (save indoors between sunset and sunrise), as a defense against burglars.

MANTUA, măn'tū-ą, Italy, a fortified northern town, capital of the former duchy, and now of the department of Mantua, 80 miles by rail southeast of Milan, on an almost insular site on the Mincio, which here divides into several arms ending in a marshy and insalubrious lake. Communication is maintained between the islands and mainland by several bridges, the chief of which is Ponte di San Giorgio, 800 yards long. Mantua is written Mantova by the Italians; it is the see of a bishop, the seat of a civil, criminal and mercantile court, and the residence both of a military governor and of a provincial delegate. The most remarkable edifices are the cathedral, after an elegant design by Giulio Romano; the church of Saint Andrea, conspicuous from a distance by its majestic cupola and Gothic tower; the church of Santa Barbara, containing the mausoleum of Carlo Gonzaga; the church of San Sebastian; the Corte Reale, formerly the ducal palace of the Gonzagas, a huge irregular pile, now partly used as barracks; the Castello di Corte or old castle of the Gonzagas; the Torre della Gabbia, the Torre del Orologio, and the Torre dello Zuccaro; the Beccheria and Peschiera, or shambles and fish market, both built by Giulio Romano; the house of Giulio Romano, the Palazzo Colloredo, with enormous caryatides supporting its façade; the Palazzo del Té, outside the walls of the town, also built by Giulio Romano, and adorned with some of that master's largest frescoes; the Accademia Virgiliana di Scienze e Belle Arti; the Liceo, the military arsenal, two theatres, one called the Teatro Virgiliano, employed for open-air performances in summer, situated in a fine piazza also named after Virgil, and containing a marble pillar surmounted by a bronze bust of the poet; the library, containing 80,000 volumes; the civic and two foundling hospitals; the Monte di Pietà, the principal house of correction for the whole of Lombardy. The manufactures are increasing. The trade is chiefly in the hands of the Jews, who live in a separate quarter. The principal article of trade is silk. There are machine works, oil and flour mills, tanneries and breweries; there is also a considerable trade in timber, which is floated down the Mincio. Mantua was an ancient Etruscan settlement, and in the time of Virgil, a native of the region, was a Roman town. Charlemagne built its first fortifications. Soon after 1115 Mantua succeeded in making itself independent, and continued so till 1276, when it fell under the iron rule of Buonacolsi or Bonacossi. In 1328 it found better masters in the Gonzagas, who, first as captains, then (from 1432), as marquises, and finally (from 1530) as dukes of Mantua, governed it with great ability, and distinguished themselves by the splendor of their court and their patronage of literature and art. The last of the Gonzaga family who reigned in Mantua was Ferdinando Carlo, or Carlo IV, who, having taken part with the French in the War of Succession, was declared to have incurred a forfeiture by withdrawing his allegiance from his liege lord the emperor of Germany. The Mantuan territory was accordingly annexed to the Austrian possessions in Lombardy, and the remaining part of Montferrat was assigned to Savoy (1708). The fortifications of the town, previously formidable, were completed and put into their modern form by the Austrians and have been kept up to date by the Italian government. In 1796 Napoleon, apparently hopeless of reducing it by any other means, contented himself with keeping it under strict blockade, till famine compelled the garrison to capitulate. After the cession of the western part of Lombardy to Sardinia in 1859, Mantua, with what else of Lombardy remained to Austria, was united to Venetia, and with it was given up to Italy in 1866. The area of the department is 903 square miles, and the population (1921) 376,901. The communal population is 40,467.

MANU, mā'noo, the reputed author of the most renowned law-book of the ancient Hindus, and likewise of an ancient Kalpa work on Vedic rites. It is matter, however, of considerable doubt whether both works belong to the same individual, and whether the name Manu, especially in the case of the author of the law-book, was intended to designate a historical personage; for, in several passages of the Vedas (q.v.), as well as the Mahâbhârata (q.v.), Manu is mentioned as the progenitor of the human race; and, in the first chapter of the law-book ascribed to him, he declares himself to have been produced by Virâj, an offspring of the Supreme Being, and to have created all this universe. Hindu mythology knows, moreover, a succession of Manus, each of whom created, in his own period, the world anew after it had perished at the end of a mundane age.

According to theosophy, the Manu is a great Being (though once a man) who governs the earth planet; other Manus govern other planets, while the Logos (q.v.) created the universe. The word Manu is chiefly used with reference to the author of an ancient renowned Hindu lawbook. This work is not merely a law-book in the European sense of the word, it is likewise a system of cosmogony; it propounds metaphysical doctrines, teaches the art of government, and, among other things, treats of the state of the soul after death. The chief topics of its 12 books are the following: (1) creation, (2) education and the duties of a pupil, or the first order; (3) marriage and the duties of a householder, or the second order; (4) means of subsistence and private morals; (5) diet, purification and the duties of women; (6) the duties of an anchorite and an ascetic, or the duties of the third and fourth orders; (7) government and the duties of a king and the military caste; (8) judicature and law, private and criminal; (9) continuation of the former and the duties of the commercial and servile castes; (10) mixed castes and the duties of the castes in time of distress; (11) penance and expiation; (12) transmigration and final beatitude.

Bühler has proved that Max Müller was right in regarding the extant work as a versified recast of an ancient law-book, the manual of a particular Vedic school, the Mânavas; and holds that the work, the date of which used to be given at 1200 B.C., was certainly extant in the 2d century A.D., and seems to have been composed between that date and the 2d century B.C. There are many remarkable correspondences between this work and the Mahâbhârata, suggesting the use in both of common materials.

MANUAL ACTS, in ecclesiastical and Church hitsory, acts performed by the hands of the celebrant in the mass, chiefly the fraction of the host, and making the sign of the Cross over it before consecration. Both were objected to at the Reformation.

MANUAL ALPHABET, the deaf and dumb alphabet; the letters made by deaf and dumb persons with their fingers.

MANUAL BLOCKING. See BLOCK SIGNAL SYSTEM.

MANUAL TRAINING. As an educational term, manual training includes all handwork used as a means in general education. It differs from trade education through the apprenticeship system in that it emphasizes the educational element rather than the commercial or industrial element. This "hand-training," however, differs from education in its broader meaning, in that it emphasizes manual skill, and makes such by-products as judgment, accuracy, habits of observation, language, etc., more or less important incidents in the results to be attained. The more recent development of vocational training has tended to cast doubt upon the validity of manual training as a part of education, while the advocates of the traditional features of education — literature, history, mathematics, science, philosophy,— have never admitted it to a place in their educational scheme. The term has therefore become restricted to those forms of handwork which are used as agencies in general education as distinct from vocational, trade and industrial education. The manual training advocates continue to hold that habits of accuracy, judgment and observation and sincerity, formed through manual activities, will contribute to these same mental habits as permanent life characteristics. In this they return under peculiar circumstances to the doctrine of formal discipline, approaching the matter in reverse order from the early devotees to this doctrine. Nevertheless it is on this theory that manual training is now holding its place in American public education. When it surrenders this position it must become prevocational or vocational training.

History of Manual Training.— Finland holds the honor of the earliest use of handwork as an agency in education. Between 1858 and 1866 a plan was developed for teaching handwork in the primary schools, and for training handwork teachers for the public schools.

Sweden established handwork as a part of its educational system in 1872. This included carpentry, wood-turning, wood-carving, coopers' work, book-binding, etc., activities selected from the Hus Slöjd occupations from which we have the well-known "Sloyd Work." Sweden was concerned with the physical health of its people as well as the passing of the old system of house industries. It was hoped that this manual work would invigorate the physical and moral health of the people who lived under artificial city conditions; and that industry would be stimulated by a wide diffusion of manual skill. The Swedish nation has now made handwork an integral part of its public school program and has thus laid a broad and sure foundation for the excellent technical and trade schools above.

France adopted handwork in 1873 in the École Salicis, and in 1882 made such work compulsory in all elementary schools. From its very beginning drawing has been emphasized and mathematics has been a closely related subject. Because of this academic work the French have drawn the regular teacher into this handwork movement side by side with a trade teacher who gives the practical work. This relationship between the academic teacher and the trade-teacher has been adopted by other countries and has apparently proved its usefulness.

England opened its first handwork classes in 1886 and to-day all the large centres of population require such work in their schools. The government awards special financial grants to municipalities who give manual training to boys and girls of 11 years and older.

Germany has long emphasized manual instruction for the artisan classes in her population but her emphasis has been on trade or vocational features. Skill of hand has been the purpose, rather than such moral qualities as were sought, for example, by the Swedish system. As a consequence Germany developed trade and occupation schools, rather than manual training courses in the "*real-schulen.*" The Gymnasia of course give no training in handwork. In fact, there has been no general scheme adopted by any considerable portion of Germany. This is probably due to the fact that trade and occupational training were efficiently carried on. Recently, since 1887, some schools have adopted typical manual training courses, and the Manual Training Seminary at Leipzig is the principal source of manual training teachers within the Empire.

Manual training in the United States has depended on private and local initiative. There had been no national movement prior to 1917. The Ethical Culture Society of New York City made the first step by opening handwork classes for small children in 1878 in connection with its workingmen's school. This was followed in 1880 by Washington University, Saint Louis, Mo., under the direction of Calvin A. Woodward. This experiment consisted of a fully equipped manual training high school with a variety of shopwork in wood and metal, mechanical drawing, and in such appropriate academic work as science and mathematics. It was a pioneer school and its success was noticed by many of the large American cities. By 1900 a majority of American municipalities had adopted some form of manual training. Work for girls as well as boys was included in the program. The courses for girls included sewing, dressmaking, millinery, burnt wood, leather and art jewelry; for boys it included joinery, wood-turning, pattern-making, forging, machine-shop, foundry, sheet-metal, printing, electric wiring, etc. In the elementary school handwork has likewise found a large place on the program, beginning in the kindergarten and continuing through the elementary grades. The activities include paper folding and paper cutting, basketry, clay-modeling, wood-carving, raffia work, etc. Correlation with drawing is more and more the rule. The best practice in the public schools now relates drawing to the experiences of the child. Design is the basis of the work and the design of the drawing-class frequently becomes the project of the handwork-class in the upper grades. Manual training in the American high school early developed into a distinctive institution. Its handwork or shop-work program is only remotely

related to industry. The projects are often impractical because they are chosen, not because of their utility or industrial significance but because they illustrate fundamental processes of industry. Type constructions are used as analytical studies of various manufacturing processes. A complete product is not sought nor are such elements as time, commercial value and shop atmosphere made a part of the instruction. The purpose of this typical Manual Training High School is vaguely educational, remotely industrial. As such, it fails to meet the needs of many industrial communities.

The Vocational Motive.—A change of sentiment became apparent immediately after the Saint Louis Exposition of 1904. Educators who had investigated the subject in Europe and America, who saw the display of the nations' handwork, seemed to feel the need of training that related more closely to life motives. Manufacturers demanded industrial efficiency and appeared to have no confidence in the vague results of the typical Manual Training High School which was a traditional school with shop facilities. A demand arose for "shops with schools attached" or with school facilities. Manual training was soon modified so as to add the vocational appeal to boys and girls of 14 years of age and upward. The handwork of the seventh and eighth grades has come to be known as "prevocational" in the sense that the processes of many vocations are taught with the purpose of giving the child an opportunity to choose wisely with the aid of vocational advisers among teachers, parents and industrial or vocational experts. The logical step to follow this "prevocational" work is the trade school so that the advance of the vocational and industrial motives makes the old manual training ideal recede.

Industrial Education and Manual Training.— Industrial education is a more comprehensive term than manual training. It includes all that was at first expected from manual training as a stimulus to efficient workmanship; all that vocational and "prevocational" training propose; all that trade education seeks to secure. The emphasis is now on training and the specialized education pertaining to special industries, while the vague educational results of manual training which it was claimed would come by transfer of faculties, drop below the horizon.

Appreciation of the value of vocational education from the national standpoint was shown by the passage by Congress in 1914 of the Smith-Lever Bill, and in 1917 of the Smith-Hughes Bill. The former provided Federal co-operation with the States, chiefly along agricultural lines, while the former created a Federal Board of Vocational Education, and also provided for co-operation with the States in all branches of vocational training. After the World War the Federal Government provided, on a gigantic scale, facilities for vocational training for all honorably discharged soldiers who wished to take it. Up to 1 Nov. 1926, 179,674 veterans had taken this training, and of this number 127,348 had completed the courses. See EDUCATION, INDUSTRIAL; EDUCATION, TECHNICAL; VOCATIONAL EDUCATION.

A. R. BRUBACHER,
Late President, State College for Teachers, Albany, N. Y.

MANUCODIA, măn-u-cō-dĭ-ą, in ornithology, a group of birds either belonging or closely allied to the *Paradiseidæ,* and peculiar to the Papuan sub-region. The plumage is glossy steel-blue; the outer and middle toes are united for some distance, and there is an extraordinary convolution of the trachea in the males, to which the loud and clear voice of the birds is owing. Mr. Sharpe divides the Manucodia into two genera: Phonygama and Manucodia proper, of which four species are admitted — *Manucodia chalybeata* (*chalybea*), from the northwest, and *M. comriei,* from the southwest, of New Guinea; *M. atra,* widely distributed over the Papuan sub-region, and *M. jobiensis,* peculiar to the island whence it derives its specific name.

MANUEL I, Comnenus, man'ū-ĕl kŏmnē'nŭs, a Byzantine emperor: b. about 1120; succeeded his father, Joannes II, in 1143, died in 1180. The valor which he had displayed against the Turks induced his father to bequeath the crown to him rather than to his elder brother Isaac, who was immediately imprisoned by Axuch, the minister of the deceased emperor. Returning from his campaign in Cilicia, Manuel was received with enthusiasm at Constantinople, but was at once involved in wars both in the East and the West, which lasted with brief intermissions through his reign. In 1144 he subjected Raymond, the rebellious Latin prince of Antioch. In 1145 he defeated the sultan of Iconium in successive pitched battles. In 1147 he promised his aid to the new crusade headed by Louis VII of France and Conrad III of Germany, and though he allowed them a passage through his dominions he gave secret information to the Turks.

In 1148 he began the most important war of his reign with Roger, the Norman king of Sicily, who had taken Corfu and prepared to invade Greece. He formed an alliance with the Venetians, who within a year joined him before the fortress of Corfu, which was surrendered after an obstinate siege. He was prevented from invading Sicily by hostilities of the Serbians and Hungarians, instigated by Roger, the former of whom were vanquished in two campaigns, but the latter protracted the war till 1152. In that year he suffered a reverse from the Turks in Cilicia, but his general, John Ducas, gained so great successes in southern Italy that Manuel conceived the project of reuniting the eastern and western empires.

The defeat of Alexis, the successor of John Ducas, by William, the successor of Roger, soon followed; the Sicilian admiral Maius routed the Greek fleet off Negropont, and advanced toward Constantinople; and Manuel therefore accepted an honorable peace in 1155. Those Greek prisoners who were silk-weavers were retained in Italy, and gave origin to the flourishing Italian silk manufactures. In the following years he waged successful wars with Raymond, Prince of Antioch, and Az-ed-din, the Turkish sultan. A new war soon broke out with Gejza, king of Hungary, which was terminated by a disastrous defeat of the Hungarians near the present Semlin. In 1176 he experienced a terrible defeat from Az-ed-din in the mountains of Pisidia, and was obliged to sign a disadvantageous peace. By breaking the treaty and renewing the war he

obtained honorable terms. His many military campaigns weakened the empire financially and contributed to its ultimate collapse. He was succeeded by Alexius II Comnenus.

MANUEL II Palaeologus, Byzantine emperor: b. 1350; d. 1425. He was the son of John V, and coregent with John VII. In 1391 he was a hostage at the court of Bajazet (Bayazid) I, sultan of the Ottoman Empire, at Brusa. Having effected his escape, he was attacked by Bajazet but was assisted by an army of Hungarians, Germans, and French. However, the allies, under command of Sigismund, king of Hungary, were badly defeated at Nicopolis (Nikopol) by Bajazet in 1396, and Manuel was shortly besieged in Constantinople (now Istanbul). During 1399–1403 Manuel II visited Italy, France, and Germany, seeking to establish a union of the Latin and Greek churches and to obtain help against the Turks. The defeat of the latter at Angora (Ankara) by Tamerlane (Timur) in 1402 saved the threat to Constantinople, but Manuel failed to take further action against Bajazet, who died the next year. In 1422 the emperor was once more besieged in Constantinople, on this occasion by Murad II, and a few months before the end of his life Manuel was compelled to agree to the payment of tribute to the Ottoman Empire. He was a prolific writer, composing poetry and producing works on rhetoric and theology. His successor was John VIII Palaeologus (r. 1425–1448).

MANUEL II, king of Portugal: b. Lisbon, Nov. 15, 1889; d. Twickenham, England, July 2, 1932. He was the second son of Carlos I, and in boyhood, when he was known as the Duke of Beja, he was trained for a naval career. On Feb 1, 1908, his father and his elder brother, Louis, were assassinated in the streets of Lisbon and Manuel, then 18 years of age, was called to the throne. He inherited a burden of unpopularity with which his training had not fitted him to cope, and republican victories at elections in Lisbon and Oporto were followed in October 1910 by a naval revolt which forced the young king to flee the country. By way of Gibraltar he made his way to England after a reign of only 32 months, and the remainder of his life was spent in exile. While he never officially abdicated, he took no action to regain his throne. A man of great wealth, he led the life of a cultured country gentleman, among his books, his artistic pictures, and his sporting interests. He possessed a collection of early Portuguese books said to have no rival outside of the British Museum. In 1913 he married Augusta Victoria, daughter of Prince William of Hohenzollern; there was no issue. His body was returned to Portugal in August 1932 for burial in Lisbon's Pantheon, where funeral services were attended by the president of the Portuguese republic; he bequeathed his entire Portuguese estate to the government.

MANUEL, Don Juan, Spanish prince and writer: b. Escalona, May 5, 1282; d. 1349. He was a nephew of Alfonso X and cousin of Sancho IV. During the minority (1320–1325) of Alfonso XI he served as a coregent, and he also commanded a Spanish army fighting the Moors. His chief claim to remembrance, however, is as a writer of prose works notable for singular simplicity and charm. The finest of these was *Libro de Patronio,* more commonly known as *El Co Lucanor,* a collection of tales written in a hi moral tone.

MANUL, mă'nōōl, the common wildcat Siberia and Tibet. It is smaller than the E ropean wildcat and is stockily built; it has moderately long tail and a coat of long ha The general color is yellowish white, with blackish mark on the chest and upper part the forelegs, and some dark lines across haunches and ringing the tail. Two black li on the cheeks and a black spot behind the sh ear are other distinguishing marks. There a curious similitude of appearance between t animal and the pampas cat of Patagonia.

MANUMISSION, in Roman law, solemn ceremony by which a slave was em cipated. Constantine the Great allowed Christian masters to emancipate their slaves fore the altar on festival days, and especially Easter, by placing the deed of emancipation the head of the freedman in the presence of congregation. See EMANCIPATION.

MANURES AND MANURING. AGRICULTURAL CHEMISTRY; FERTILIZERS.

MANUS, mă'nŭs, largest of the Admira Islands, a group comprised within the Australi administered Territory of New Guinea. It situated 160 miles west of Lavongai, in the B marck Archipelago; it is 52 miles long by miles broad, and has an area of 650 square mi The island is densely wooded and mountaino the highest elevations approximating 3,000 fe Lorengau, at the northeastern end of the isla is the chief port and administrative headquarte Manus contains numerous coconut plantatio and off the coasts lie valuable trochus and pe shell fisheries. During World War II the Uni States constructed an extensive naval base Manus, harnessing the Lorengau River to sec hydroelectric power and building a bridge acr Loniu Passage to the neighboring island of N Negros. Manus was discovered in 1616 by W lem Cornelis Schouten (q.v.), visited by Phi Carteret and the Chevalier d'Entrecastea (qq.v.) in 1767 and 1791 respectively, and s veyed by the *Challenger* Expedition (q.v.) 1875. It was agreed between the governments Australia and United States after World War that the naval forces of both powers would ha the use of the Manus base.

MANUSCRIPTS (Latin, *manuscript* written by the hand), are literally writing any kind, whether on paper or any other m terial, in contradistinction to printed matt Previous to the introduction of printing all lite ture was contained in manuscripts. All the exi ing ancient manuscripts are written on parc ment or on paper. The paper is sometim Egyptian (prepared from the real papy shrub) sometimes cotton or silk paper (*cha bombycina*), which was invented in the E about the year 706 A.D., and used till the int duction of linen paper, and in common w this till the middle of the 14th century; so times linen paper, the date of the invention which, though ascribed to the first half of 13th century, on the authority of a docum of the year 1243, written on such paper,

nevertheless exceedingly doubtful. The earliest mention of quill pens is in the 7th century. The most common ink is the black, which is very old. The oldest, however, was not mixed with vitriol, like ours, but generally consisted of soot, lamp-black, burned ivory, pulverized charcoal, etc. Red ink of a dazzling beauty is also found in ancient times in manuscripts. With it were written the initial letters, the first lines, and the titles, which were thence called *rubrics,* and the writer *rubricator.* More rarely, but still quite frequently, blue ink is found in ancient manuscripts; yet more rarely green and yellow. Gold and silver were also used for writing either whole manuscripts (which, from their costliness, are great rarities), or for adorning the initial letters of books. With respect to external form, manuscripts are divided into rolls (*volumina,* the most ancient way, in which the troubadours in France wrote their poems at a much later period) and into stitched books or volumes (properly *codices*). Among the ancients the writers of manuscripts were mainly freedmen or slaves (*scribæ librarii*). Some of the professional copyists in Rome were women. When Origen undertook the revision of the Old Testament (231 A.D.), Saint Ambrose sent to his assistance a number of deacons and virgins skilful in caligraphy. Subsequently the monks, among them the Benedictines in particular, were bound to this employment by the rules of their Order. In all the principal monasteries was a *scriptorium,* in which the *scriptor* or scribe could pursue his work in quiet, generally assisted by a *dictator,* who read aloud the text to be copied; the manuscript was then revised by a *corrector,* and afterward handed to the *miniator,* who added the ornamental capitals and artistic designs.

It is more difficult to form a correct judgment respecting the age of Greek manuscripts from the character of the writing than it is respecting that of Latin manuscripts. In general it is to be remarked that in a Greek manuscript the strokes are lighter, easier and more flowing the older it is, and that they become stiffer in the progress of time. The absence or presence of the Greek accents is in no respect decisive. Some Greek papyri are earlier than the Christian era, but most are not earlier than about the 6th century. The characters in Latin manuscripts have been classified partly according to their size (*majuscula, minuscula*), partly according to the various shapes and characters which they assumed among different nations or in various periods (*scriptura Romana antiqua, Merovingica, Longobardica, Carolingica,* etc., to which has been added since the 12th century the *Gothic,* so called, which is an artificially pointed and angular character); and for all of those species of writing particular rules have been established, affording the means of estimating the age of a manuscript. Before the 8th century punctuation marks rarely occur: even after the introduction of punctuation, manuscripts may be met with destitute of points, but with the words separate. Manuscripts which have no capital or other divisions are always old. The *catch-word,* as it is termed, or the repetition of the first word of the following page at the end of the preceding, belongs to the 12th or subsequent centuries. The fewer and easier the abbreviations of a manuscript are the older it is. Finally, in the oldest manuscripts the words commonly join each other without break or separation. The division of words first became general in the 9th century. The form of the Arabic ciphers, which are seldom found in manuscripts earlier than the first half of the 13th century, also assists in deciding the age of a manuscript. Some manuscripts have at the end a statement when, and commonly also by whom, they were written (*dated codices*). But this signature often denotes merely the time when the book was composed, or refers merely to a part of the manuscript, or is entirely spurious. The most ancient manuscripts still preserved are those written on papyrus which have been found in Egyptian tombs. Next to them in point of age are the Latin manuscripts found at Herculaneum, of which there is a rich collection in the Naples Museum. Then there are the manuscripts of the imperial era, among which are the Vatican Terence and Septuagint and the Biblical codices in the British Museum. Since the middle of the 19th century many manuscripts of Greek writings have been found in Egypt, among the chief being that containing the orations of Hyperides, several containing parts of the works of Homer, Plato, Demosthenes, etc., that in which occurs a portion of the Antiope of Euripides, and the almost complete text of Aristotle's work on the constitution of Athens. It was the custom in the Middle Ages to obliterate and erase writings on parchment for the purpose of writing on the materials anew, and these manuscripts, many of them of great value, are known as "palimpsests." This custom ceased in the 14th century, probably because paper came then more into use. See LIBRARIES; MANUSCRIPTS ILLUMINATED; MANUSCRIPTS OF THE BIBLE; PALEOGRAPHY; PAPYRUS.

ANUSCRIPTS, Illuminated, are those whose text is heightened and brightened by vignettes and other decorations in colors, gold and silver. The verb to *illuminate* first occurs in the beginning of the 18th century; and means to decorate an initial letter, a word, or a text of a manuscript with gold, silver or brilliant colors, or with elaborate tracery, miniature illustrations and designs. The older verb was to *enlumine* (Old French *enluminer;* late Latin, *inluminare;* classic Latin, *illuminare*). It occurs, A.D. c. 1366, in Chaucer, A. B. C., 73, "Kalendeeres enlumyned ben"; A.D. c. 1400, 'Roman de la Rose,' 1695, "For it so welle was enlomyned"; A.D. 1430, Lydgate, 'Chron. Troy,' Prol., "For he enlumineth by craft and cadence this noble storye with many freshe coloure of Rhetorik." Illumination differs from painting, according to Ruskin, 'Modern Painters' (1856, Vol. III, iv, viii, sec. 9), in that "illumination admits no shadows, but only gradations of pure colour." The earliest writing of many peoples was by means of pictures. Witness the pictographs of Sumeria, that later evolved into Babylonian cuneiform script; the hieroglyphic writing of Egypt; the crude scrawls of our American Indians; and

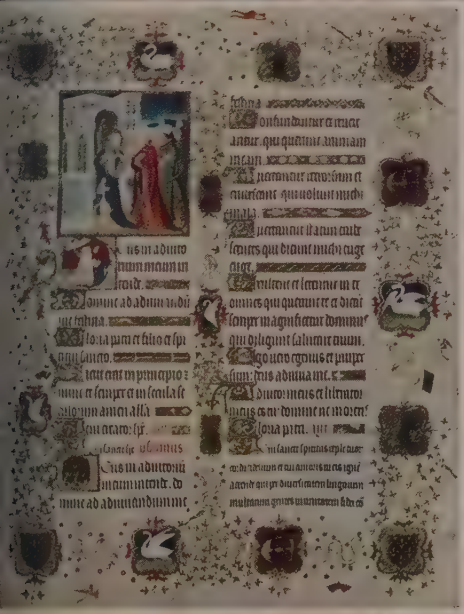
the Aztec picture-writing, which still defies epigraphists. It was but natural that an art arose of embellishing these pictographs. Fifteen centuries before Christ the papyrus rolls that contain the ritualistic 'Book of the Dead' were illuminated with brilliantly colored scenes. In due time the art of illumination passed over to peoples whose script was alphabetic; it always remained an art of beautiful writing. There is truth, though characteristically narrow and dogmatic in expression, in the saying of Ruskin, 'Lectures on Art' (1870, v. 138): «Perfect illumination is only writing made lovely; the moment it passes into picture making it has lost its dignity and function.»

I. Illumination in the East. 1. In Egypt. — The earliest specimens of illumination are on Egyptian papyrus rolls. Ritual directions are in red; hence the mediæval *rubric*. Profile portraits are inserted into the text. Agricultural and household scenes are interspersed between hieroglyphic signs. From the Egyptians the art of illumination reached the Hellenic folk of Alexandria. A 4th century B.C. papyrus manuscript of the poems of Timotheus, found at Abûsir, has a bird as a punctuation mark. Not until the Christian era do miniatures adorn the text. A 1st century A.D. Greek papyrus (Bibliothèque Nationale de Paris) shows a text that is adorned with miniatures in bold relief. A Berlin papyrus, Kaiser Friedrich Museum, illustrates the cure of a demoniac by Jesus. While in Hellenic Egypt the art of illumination thus progressed, the Coptic artists carried on a separate tradition from their ancient Egyptian forebears. A Coptic chronicle, dated 392 A.D. (Goleniscey collection) has a wealth of miniatures illustrative of the months, the provinces of Asia, the rulers of Rome, Lydia and Macedonia, together with the destruction of the Serapeum under the direction of the patriarch, Theophilus. The Morgan collection of Sahidic manuscripts, of the 9th and 10th centuries, contains a dozen manuscripts with miniatures of the Virgin and her Son, angels, martyrs, saints, hermits; and almost all of the 58 manuscript volumes of this remarkable Coptic library are illuminated with marginal decorative schemes of animals and plants.

2. In Syria. — The monks of Syria show the traditions of the Semitic orient in the illumination of manuscripts. Saint Augustine, 'Adv. Faustum' (xiii, 6, 18), refers to the miniature illustration of Persian parchments. From the 5th century, there were monastic schools for illumination in Mesopotamia and Syria. The Syriac Evangeliary, 586 A.D., the work of Rabbula at Zagba in Mesopotamia, now in the Laurentian Library, Florence, is an exquisite work of art; the miniatures represent the Crucifixion, etc.; the marginal schemes are geometrical, and contain flowers, birds, etc. Some Hellenistic influence is noticeable; but Semitic traditions dominate in the Syriac school of illuminating. To this school belong also the extant Armenian illuminated manuscripts. Three evangeliaries, books of pericopic readings from the Epistles and Gospels, show the most beautiful work of Armenian miniaturists: that of Etschmiadzin, 10th century, copied from a 6th century model; that of Queen Mlke, 902 A.D., Monastery of the Mechtarists, Venice; and the Tübingen Evangeliary, 1113 A.D. Mohammedan illumination copied Syriac in many Arabic, Turkish and Persian manuscripts, chiefly of the Qûran. The decorative work is often rich in its red blue and gold cufic characters.

3. The Byzantine School. — In the Hel lenistic speaking parts of the Byzantine Em pire, the traditions of ancient Greece hel sway; although iconoclasm interfered for while with the progress of miniature painting and Syriac influences were strong. Previous t the destructive vandalism of the iconoclasts Byzantine miniaturists beautified the great 6t century purple parchment, Biblical codices L, *Vienna Genesis,* silver letters; N, *Cod. Pur pureus,* silver letters, Gospels, most of manu script at Petrograd; Σ, *Cod. Rossanensis,* si ver letters, Matthew and Mark, at Rossano, i Calabria; Σb, *Cod. Sinopensis,* gold letter Matthew, in the Bibliothèque Nationale d Paris; Φ, *Cod. Beratinus,* Matthew and Mark at Berat, Albania. These illuminated manu scripts contain Biblical scenes, the bearded fac of the Christ, etc., — all in miniature. To thi period of Byzantine illumination belongs th 'Roll of Joshua,' 11 yards long, at the Vatica which pictures the story of the great leader and the manuscript of Dioscorides, at Vienna 472 A.D., containing portraits of physicians tha were copied from originals. All this early By zantine illumination was along broad lines, fre from stereotyped forms, — save the hieratic an fixed faces, — classic in artistic merit, brilliar in coloring, and profusely decorated with gold.

Iconoclasm during the 8th and 9th centurie wrought havoc to the art of illumination in th Byzantine Empire. Precious manuscripts wer recklessly destroyed or ruthlessly mutilated The artists of the iconoclastic period substitute ornamentation for miniature; flora, fauna an geometric forms for figure-painting. An in stance of their work is the 'Evangeliary' a Bibliothèque Nationale de Paris, Gr. 631. Th triumph of image-worship, 842 A.D., brough about a return to the painting of figures. Th 10th to the 12th centuries were the most gloriou period of Byzantine miniaturists. About 4 years after the restoration of image-worshi the 'Sermons of Saint Gregory of Nazianzen (Bibliothèque Nationale de Paris, Gr. 510) 880 c. A.D., were executed, and embellished b a series of large, beautiful miniatures. Th 'Paris Psalter,' dating from the 10th centur (Bibliothèque Nationale de Paris, Gr. 139), ha scenes of the life of David, reproduced fro 3d or 4th century models, that vie with th frescoes of Pompeii in freshness and brilliancy The 'Homilies of Saint John Chrysostom,' Pari a manuscript which belonged to Nicephorus II (1078–81 A.D.) is likewise a good examp of Byzantine illumination at its maturity The Psalter and the Menologion, a brief sketc of the lives of the saints for each day, wer at this time most frequently decorated. Th 'Vatican Psalter' (1059 A.D.), in the Barberi Library; and the Menologion of Basil II (976 1025 A.D.) in the Vatican, are rich in minia tures of brilliant coloring. Here should b mentioned the Slavic school of illuminatio It was Byzantine at first; and gave us th 'Chloudov Psalter,' 9th century, at Moscow Between the 12th and 16th centuries, a nationa style appeared, which is characteristic of man of the numerous and richly illumined manu scripts of the libraries and museums of Petro grad and Moscow.



MANUSCRIPTS, ILLUMINATED: *Top:* "Lancelot of the Lake at the Tomb of Galahad," an illumination in two scenes by a French artist of the 14th century. *Center left:* A 15th-century Flemish illumination of the "Duc de Berry received by St. Peter." *Center right:* "The Bible of St. Louis," an illumination by a French 13th-century artist. *Bottom left:* "Tree of Jesse, Book of the Mass," done in Germany, 15th century. *Bottom right:* Italian 15th-century miniature of the "Stigmatization of St. Francis."

An English missal, of the early 14th century. This manuscript was known as the Tiptoft Missal, since it was writte and illuminated for Hawse de Tiptoft (d 1345) and John Clavering (1266–1332) to whom she was married. Folio 14 (*pictured here*) shows the standing figures of Saint John the Evangelist and Saint John the Baptist in the right borde In the left border, are the kneeling figures of John Clavering and Hawse de Tiptoft.

II. **Illumination in the West.** **1. Early Italian.**— As manuscript writing, so illumination began in the East, and was thence taken over by the West. Pliny, 'Historia Naturalis' (xxv, 8) is witness to miniature-painting in Rome during the 1st century B.C. Martial (xiv, 1865) speaks of a parchment containing a portrait of Virgil. Varro had some 700 such miniature portraits. The most ancient illuminated manuscripts probably of western provenance are: the fragmentary 'Iliad,' 3d century, Ambrosian Library, Milan; the Vatican Virgil, the 'Schedæ Vaticanæ,' 4th century, Vat. Lat. 3225, with 50 miniatures; the 'Codex Romanus,' another Vatican Virgil. Here be it noted that Latin illuminators gave us the word *miniature,*— from the Latin *minium,* which means red lead or cinnabar,— the vivid-red lead oxide used as a pigment. Hence also is *minare,* to paint in miniature; together with *miniator,* the miniature-painter. Early Italian illumination is not very well known to the historian of art. Byzantine art reacted on Italian; and this reaction is marked in mosaics, early Italian painting, and the earliest illumination of manuscripts in southern and central Italy. Through Italy, the East influenced the illuminators of the Frankish Empire.

2. Celtic Illumination.— It was during this period of decline of illumination in the West that the Irish school, as early as the 7th century, broke completely away from the copying of ancient models and inaugurated its own style of book-ornamentation. The individuality of the artists, the civilization and character of their race, were expressed in an art that reached the very height of perfection and made its influence felt in continental Europe. The Celtic initials, margins, and full-page designs are easily recognized by their great intricacy of interlacing spirals, zigzags, and ribbons, that entangle animal and human shaped fancies, knots, and other designs,— all executed with a marvelous precision of mathematical accuracy, graceful delineation, delicate touch, brilliant coloring, and most fecund imagination. Irish illumination is decidedly oriental in conception and execution; and seems to point back to the ancient civilization of the race, before the Celtic migration from the steppes of Asia, across Asia Minor, by way of Austria, Switzerland, Spain and France. No trace is found of classic influences. Foliage is absent. Kinship with the sculpture on stone and jewels in barbaric Ireland is marked. The wonderful decorative schemes are more like to the Arabic than to any other; and the human form is depicted with a geometrical symmetry that is characteristic of Coptic workmanship. The finest example of Celtic illumination is in Q, 'Codex Kenanensis,' the Book of Kells, 8th century, Vulgate Gospels, in Trinity College, Dublin. Its pages are replete with brilliant, exquisite designs, testifying to a minuteness and delicacy of precision that are a marvel to art critics. The Celtic art of illumination reached Iona through Saint Columba's foundation there; and the monks of Iona (635 A.D.) brought their faith and their art to Lindisfarne, or Holy Isle, off the Northumbrian coast. Here was executed in Celtic style the 'Lindisfarne Gospels,' 8th century, now in the Cottonian collection of the British Museum. Other fine works of the Celtic school of illuminators are the 'Book of Deir'; Δ, *Codex Sangallensis,* 9th or 10th century, Gospels in Greek and Latin, at Saint Gall, Switzerland. In England, the Celtic school of illumination dominated, although manuscripts brought by Saint Augustine from Rome introduced a classic influence. The 'Utrecht Psalter' (800 A.D.) is representative of the Celtic style in transition. It shows crude attempts at drapery effects. In Anglo-Saxon miniatures, frames of foliage and fluttering draperies become characteristic. The 'Benedictionale' of the see of Devonshire is the most elaborate specimen of 10th century Anglo-Saxon miniatures. The Norman Conquest saved Anglo-Saxon illumination from the fantastic exaggerations into which it was sinking.

3. Carlovingian Illumination.— When Charlemagne became emperor of the West (800 A.D.) illumination was rapidly revived. The Celtic style provided to this new school its interlacements; Byzantine art was drawn upon for the painting of the human figure. Gold was used profusely in letters as well as illustrations. Large initials were almost the rule. Ornamentation was luxurious. Miniatures represented historical characters, symbolical themes, the arts, signs of the zodiac, virtues, vices, etc. Notwithstanding the gorgeous effect of purple vellum, a dazzling abundance of gold, and a brilliance of decoration, the Carlovingian illuminated manuscripts show a tendency to coarseness of workmanship and clumsiness of figure-painting. This tendency is in part offset by the purer style of the Celtic influence. The best examples of early Carlovingian illumination are: the 'Evangeliary,' said to have been illuminated by Godescalc for Charlemagne in 787 A.D., whose text is in gold letters on a purple ground, and whose every page is illustrated with a different decorative scheme; another 'Evangeliary' of Charlemagne, at Vienna; the 'Bible of Theodulf,' bishop of Orleans, at Paris and Le Puy; the 'Sacramentary,' written for Drogon, son of Charlemagne and bishop of Metz; the 'Evangeliary of Lothair,' Paris; and the 'Bible of Charles the Bald,' presented by Count Vivien, abbott of Saint Martin of Tours. It was about the time of Charles the Bald, second half of the 9th century, that Carlovingian illumination reached its greatest perfection.

4. Gothic Illumination.— The 10th to the 12th centuries show a decadence of Frankish illumination. After the 'Regensburg Gospels' (11th century) miniatures become more coarse and clumsy, colors are dull. Toward the end of the 12th century, a renascence of illumination is visible in both Germany and France. Gold is now laid on in leaf, and not in liquid; burnishing makes the illumination most brilliant. The old illuminators were monks; now laymen take up the art. The initials are smaller, but more artistic; they often contain miniatures of illustration or interpretation of the Biblical text. Hundreds of miniatures beautify the 'Picture Bibles' of the 13th century, or interpret the 'Sermon Bibles' of the period. Gothic features are introduced,— gables, pinnacles, rose and quatrefoil decorations. The human figure is painted with realism; 13th century costumes are preserved to us in an accuracy of coloring. During the 14th century, there is a departure

from conventional foliage, and a reproduction of garlands and flowers from nature. And with the flowers are intermingled peasants, birds, animals, butterflies, etc.,— all true to life. The 'Breviary of Belleville,' (Bibliothèque Nationale de Paris, Lat. 10483–4) the work of the famous Parisian illuminator, Jean Pucelle, together with Mahiet Ancelet and J. Chevrier; the 'Book of the Miracles of Our Lady,' Soissons; 'Queen Mary's Psalter' (British Museum), done for Mary Tudor, are all exquisite works of 14th century craft. The golden age of illumination continues during the early 15th century. Even at the outset of the Renaissance, the Gothic manner prevails. Books of Hours are the special feature. Such is the 'Très Riches Heures' of the Duke of Berry, Musée Condé, Chantilly, by Pol de Limbourg, containing miniatures of the various châteaux of the duke, and portraying marvelous aerial perspectives in landscape scenery,— the effects of snow, starlight, blazing sunlight and dull autumn shades. Other beautiful *Horæ* are the 'Grandes Heures,' by Jacquemart de Hesdin; 'Très Belles Heures,' and 'Heures de Turin,' of the same Flemish school; and the 'Hours of Anne of Brittany' (1508 A.D.). This last work marks the end of the art of illumination. The Renaissance, together with the invention of printing, were fatal to miniature painting of books, and to the illumination of their carefully written pages.

WALTER DRUM, S.J.

Late Professor of Scripture, Woodstock College, Maryland.

MANUSCRIPTS OF THE BIBLE are written as opposed to printed copies of the whole Bible or a part thereof. All these manuscripts, whether of the original text or of an ancient version, so long as they were done before the invention of the art of printing, are important in the science of the textual criticism of Holy Writ. This article will contain a brief introduction on Bible manuscripts in general, followed by a summary account of the chief Hebrew, Greek, Latin, Syriac, Armenian and Coptic manuscripts of the Bible. Manuscripts of the Arabic, Ethiopic, Slavic and other early versions of Scripture do not witness to the earliest type of New Testament text; they are amply treated in technical dictionaries of the Bible.

I. Bible Manuscripts in General.— There are three classes of Bible manuscripts — papyrus, vellum and palimpsest — to which attention should be called.

1. *Papyrus Manuscripts.*— While Babylonian scribes were impressing upon endurable clay the cuneiform, or wedge-shaped, ideographic records of the style, Egyptian reed-writing with ink upon papyrus developed almost at the same pace. The name of this primitive paper is that of the plant which provided its raw material. The *papyrus,* πάπυρος, probably an Egyptian loan-word,— was a rush of thick triangular stalk.

Its main root, Theophrastus tells us, was about 15 feet long and as thick as a man's wrist. Likely the bullrush, *gómer,* the wicker out of which was plaited the ark that contained the infant Moses, was the Nile papyrus. The outer coat of this Egyptian water-plant was peeled off, the pith was cut into strips and these were glued together transversely to form the first known writing paper. Sheets of papyrus were very fragile, became brittle in air, crumbled with use, could not resist the disintegrating force of moisture and were quite impracticable for book-form. Hence all papyrus manuscripts have been lost to us, save such as were buried in the exceedingly dry soil of Upper and Middle Egypt. For many years, the ignorant *félläh'in* wantonly destroyed these precious records of the past. Now scientific excavators are preventing this ruthlessness, and constantly adding to the world's various collections of papyrus manuscripts. The most ancient papyrus document is a record of the reign of the Egyptian King Assa, B.C. 3580–3536; and the earliest literary papyrus work extant is the Prisse papyrus of Paris, written in the 5th dynasty, c. B.C. 2500. During the first three centuries of Christianity papyrus was the ordinary writing paper of the Roman Empire. It was used by the Arabs until the 8th century, when modern paper was invented. The sacred writers or their scribes most likely used ink and rolls of fragile papyrus for the *autographa* of the New Testament (2 Corinthians iii, 8; 2 John, xii). These precious documents seem to have perished during the early 2d century. No trace of them is found in the writings of either the Apostolic or Apologetic Fathers,— unless we except Tertullian's words, "the authentic letters of the Apostles themselves," which are now generally set aside as rhetorical.

Bibliography.— Deissmann, 'Bible Studies' (1901), 'Light from the Ancient East' (1910); Moulton, 'Grammar of New Testament Greek' (Vol. I, 3d ed., 1908); Milligan, 'The New Testament Documents' (1913); Moulton and Milligan, 'Vocabulary of the Greek New Testament illustrated from the papyri and other non-literary sources' (parts 1 and 2, 1914–15).

2. *Vellum Manuscripts.*— Pliny ('Historia Naturalis' xiii, 1) is witness to the use of vellum for documentary purpose before the time of Christ. Saint Paul (2 Timothy iv, 13) employed both papyrus-rolls, τὰ βιβλία, and parchment, μεμβράνας. In the 3d century, vellum began, outside of Egypt, to supersede papyrus; and in the early 4th century, the codex or parchment book-form gained complete victory over the papyrus-roll. To this century belong the earliest extant Bible manuscripts of any thing but fragmentary size.

3. *Palimpsests.*— Some of our most important vellum manuscripts are palimpsests (= Lat. *palimosestum,* παλιμψηστός "scraped again," i.e., manuscripts that were scraped a second time with pumice-stone and written upon anew). The reckless charge of wholesale destruction of Biblical manuscripts by the monastic scribes of palimpsest works has not been substantiated. Wattenbach ('*Das Schriftwesen im Mittelalter,*' 1896, pp. 299 ff), a leading authority on the subject, notes that a Greek synod, A.D. 691, forbade the use of any but u

terly unserviceable Biblical or Patristic manuscripts for palimpsest-writing. According to Wattenbach, "more precious manuscripts, in proportion to the existing supply, have been destroyed by the learned experimenters of our time than by the much abused monks of old." The deciphering of a palimpsest may at times be accomplished by merely soaking it in clear water. The "learned experimenters" use some chemical reagent, in order to bring back the original writing. Such chemical reagents are an infusion of nutgalls, Gioberti's tincture and hydrosulphuret of ammonia; all do harm to the manuscripts.

II. Hebrew Manuscripts.— Certain parts of the Hebrew Bible,— Daniel ii, 4b–vii, 28, and Ezra iv, 8–vi, 18, together with vii, 12–26,— are not in Hebrew, but in Aramaic. These Biblical Aramaic portions, in the language that the exiled Jews adopted during their Babylonian captivity (B.C. 586–536), are here treated conjointly with the Hebrew text into which they have been received. We shall briefly sum up the age, number and worth of the Hebrew manuscripts of the Bible.

1°. *Age.*— Textual criticism divides the Hebrew text of the Bible into the Masoretic and pre-Masoretic.

The Masoretic text is that of our complete Hebrew manuscripts. It represents the Masorah. This authoritative textual tradition was begun in the 1st century B.C.; was fixed in its consonantal readings during the Talmudic period (A.D. 300–500); and received the vowel points about the 8th century of our era. The pre-Masoretic text includes chiefly the readings that are not witnessed to by Masorah. The earliest manuscript of the Hebrew Bible, and probably the oldest extant Biblical manuscript, is the Nash papyrus. There are four fragments, which, when pieced together, give 24 lines of a pre-Masoretic text of the 10 commandments and of the *shemá* (Exod. xx, 2–17; Deut. v, 6–19, and vi, 4–5). The writing is without vowels, and seems paleographically to belong to not later than the 2d century. Another witness to the pre-Masoretic text is the Samaritan Pentateuch, which is probably pre-exilic in origin. The earliest Samaritan manuscript extant is that of Nablus, once rated very ancient and now assigned to the 12th or the 13th century. The newly-discovered Hebrew '*Ecclesiasticus*,' represented by fragmentary manuscripts of the 10th or 11th century, preserves parts of the pre-Masoretic text of a book until recently thought to have been written in Hellenistic.

All other Hebrew manuscripts of the Bible are Masoretic, and belong to the 10th century or later. At most 9 or 10 are earlier than the 12th century. The earliest are *Codex Petropolitanus*, dated A.D. 916; the *Saint Petersburg Bible*, dated A.D. 1009; and *Codex Oriental*, 4445, British Museum, which Ginsburg assigns to A.D. 820–850.

2°. *Number.*— Kennicott ('Dissertatio Generalis in Vetus Testamentum Hebraicum,' 1780), collated 16 Samaritan and 638 Masoretic manuscripts. De Ross; ('Variæ Lectiones,' 1784), brought the number of Masoretic manuscripts up to 1,375. No one has since surpassed this critical work of De Rossi on the Masoretic text. Some 2,000 Masoretic manuscripts gathered in the Crimea by Firkowitsch, await critical study in the Imperial Library of Petrograd. Consult Strack, 'Die biblischen und massoretischen Handschriften zu Tschufut-Kale' (In *Zeits. für luth. Theol. und Kirche*, 1875).

3°. *Worth.*— This rich store of some 3,375 manuscripts promises no very important critical results. For they all depend on an archetype of the 2d century A.D.; and are singularly alike in accuracy of reproduction. The Masoretes were most detailed in their painstaking efforts to hand down the text of this archetype. The Scribes counted words and consonants of each book; noted the middle words and middle consonants; retained peculiarities of script,— such as broken letters, inversions, consonants that were too small or too large, dots out of place, etc. All these oddities were handed down as God intended, and received mystical interpretations. Here is an instance. In Genesis ii, 4, *behibbāre' ām*, "when they were created," the letter *h* is unduly small. The rabbis handed down this peculiarity as God inspired; translated the word, "In the letter *h* he created them"; and then disputed what that meant. Hence the importance of manuscripts of the early versions of the Old Testament, so as to reach a pre-Masoretic text.

Bibliography.— Kraft and Deutsch, 'Die handschriftl. hebräischen Werke der k. k. Hofbibliothek' (1857); Strack and Harkavy, 'Catalog der hebr. Bibelhandschriften der kaiserlichen Bibliothek' (1875); Schiller-Szinessy, 'Catalogue of the Hebrew Manuscripts' (preserved in the University Library, 1876) Assemani, 'Bibliothecæ Apostolicæ Vaticanæ Codices Orientales' (1756); Mai, 'Appendix to Assemani' (1831); Neubauer, 'Facsimiles of Hebrew Manuscripts' in the Bodleian Library (1886), and 'Catalogue of the Hebrew Manuscripts' in the Bodleian Library and in the College Libraries of Oxford (1886).

III. Greek Manuscripts.— Textual critics divide Greek manuscripts of the Bible into uncials and minuscules. Uncial manuscripts are written in large disconnected letters that vary in force so as to indicate the time and place of provenance. Words are not separated; accents and punctuation marks are not used; no great variety of script is admitted; ligatures are employed for the most ordinary words; paragraphs are marked off by small lacunas. The decadence of elegant uncial writing begins in the 6th century; twists and turns are given to certain letters. In the 7th century manuscripts still greater freedom of flourish is allowed the scribe; accents and breathings are introduced, and the script leans to the right. By the 10th century the writing in Biblical manuscripts begins to be more or less cursive; these manuscripts are called minuscules. The letters are now small, connected and written with a running hand. Cursive writing holds sway in Biblical manuscripts until the 16th century. In A.D. 1514, the Greek New Testament was for the first time printed.

1°. *Old Testament Greek Manuscripts.*— Traces of the version of Aquila (C. A.D. 130) are found in: (1) fragments of Origen's third columns, written as marginal notes to some manuscripts of the Septuagint; (2) the Milan palimpsest of the Hexapla, a 10th century copy found by Mercati in 1896, containing about 11 psalms; (3) the Cambridge fragment,

7th century, giving parts of Psalm xxi.— Cf. Taylor, 'Cairo Genizah Palimpsests' (1900); (4) the Cairo fragments of the 4th and 5th centuries: three palimpsests (containing 1 Kings xx, 7–17, 2 Kings xxviii, 11–27), published by Burkitt in 1897; also four portions of the Psalms (89:17 — 91:10, 95:7 — 96:12, 98:3, 101:16 — 102:13) published by Taylor (op. cit.); (5) the 4th century papyrus fragments of Genesis i, 1–5, published by Grenfell and Hunt in 1900. Our few manuscript traces of the versions, which Symmachus and Theodotion issued toward the end of the 2d century, may be found in the same Hexaplaric fragments that witness to the text of Aquila. Theodotion's Daniel is preserved in the Septuagint manuscripts.

The Septuagint version of the Old Testament is extant in many manuscripts. These represent three textual families,— the Hexaplaric, Hesychian and Lucianic. The Hexaplaric text takes its name from the Hexapla of Origen. This colossal critical work, completed c. A.D. 240, presented in six columns the Hebrew text, the Greek transliteration thereof, Aquila, Symmachus, the Septuagint and Theodotion; and, for certain books, two other Greek translations that are named *Quinta* and *Sexta*. Pamphilus, a disciple of Origen, preserved manuscripts of the Hexapla at Cæsarea. In the 4th century, Pamphilus and his disciple, Eusebius of Cæsarea, reproduced the fifth column,— i.e., Origen's Hexaplaric Septuagint text,— together with all its critical signs. By these critical signs, Origen had marked off passages, which he had found wanting in the Septuagint and had supplied from either Aquila or Theodotion. Unfortunately the scribes were not faithful in handing down the critical signs of Origen. In this wise the Cæsarean text of the Septuagint was evolved into a hopeless commingling of Origen's Septuagint together with his interpolations from Aquila and Theodotion. Meantime two other editions of the Septuagint got a vogue,— those of Hesychius at Alexandria and of Lucian at Antioch. From these three editions of the Septuagint text, all of our extant manuscripts are descended, but by ways that have not yet been accurately traced. The Hexaplaric, Hesychian and Lucianic texts acted and reacted upon each other. The result is that most of the extant manuscripts of the Septuagint contain readings from each of the three textual families. Criticism is at work to trace the respective influences of each text upon the manuscripts now to hand. Consult Field, 'Originis Hexaplorum quæ supersunt, sive veterum interpretum Græcorum in totum Vetus Testamentum fragmenta' (1875).

A. Papyrus Manuscripts.—About 40 papyrus manuscripts of parts of the Septuagint have been found in recent years. Of these the most important are (1) *Oxyrhyncus Pap. 656*, early 3d century, preserving parts of Gen. xiv–xxvii, wherein most of the great vellum manuscripts are defective; (2) *British Museum Pap. 73*, called U, 7th century, Psalms 10–33; (3) a *Leipzig Papyrus*, 4th century, Psalms 29–54; (4) a *Heidelberg Papyrus*, 7th century, Zachary iv, 6 — Malachy iv, 5; (5) a *Berlin Papyrus*, 4th or 5th century, containing some 30 chapters of Genesis.

B. Vellum Uncial Manuscripts.— Parsons 'Vetus Testamentum Græcum cum Variis Lectionibus,' 1798), designated uncial manuscripts of the Septuagint by Roman numerals, minuscule by Arabic. Lagarde inaugurated the now common usage of Roman and Greek capitals for uncials. Von Soden's system of manuscript symbols, though illuminating, has not been widely adopted. The important vellum uncials of the Septuagint text are here subjoined:

Aleph, *Cod. Sinaiticus* (c. 350), 43 leaves at Leipzig, 156 together with New Testament at Petrograd; contains fragments of Genesis and Numbers, I Paral. 9:27 — 19:17, Esdr. 9:9 to end, Esth., Tob., Judith, 1 and 4 Mach., Isa., Jer., Lam. (in part), Joel, Abd.-Mal., the Poetical Books, the entire New Testament, Epistle of Barnabas, and part of 'Shepherd of Hermas.' The text is mixed; in Tobit it widely differs from A and B. Two correctors are of the 7th century. The first writes, at the end of Esther, that he compared the manuscript with a copy of the Hexaplaric text, authenticated by Pamphilus.

A, *Cod. Alexandrinus*, 5th century, in British Museum, complete Bible (excepting Psalms 50:20 — 80:11 and smaller lacunæ); includes deuterocanonical books and fragments, apocryphal 3 and 4 Mach., also 1 and 2 Clement; of Egyptian provenance, and likely Hesychian in text; differs much from B, especially in Judges.

B, *Cod. Vaticanus*, c. 350, in Vatican Library, complete Bible; the Old Testament lacks Gen. i–xlvi, 28, 1 and 2 Mach., parts of 2 Kings ii, Psalms 105–137; the New Testament lacks Hebr. 9:14, 1 and 2 Timothy, Titus, Apoc. provenance, Lower Egypt; text deemed by Hort to be akin to the Hexaplaric.

C, *Cod. Ephræm*, 5th century palimpsest, in National Library, Paris; 64 leaves of Old Testament, 145 out of 238 leaves of New Testament.

D, *Cotton Genesis*, 5th century, British Museum; fragments of Genesis; almost destroyed by fire in 1731, but previously collated.

E, *Cod. Bodleianus*, 9th or 10th century, Bodleian Library, Oxford, Heptateuch, fragments.

Q, *Cod. Marchalianus*, 6th century, Vatican, Prophets complete; provenance, Egypt; text Hesychian; marginal notes from Hexapla contain Hexaplaric signs.

Theta, *Cod. Washington*, 5th or 6th century, Smithsonian Institution, Deuteronomy to Joshua.

Among uncial manuscripts of the Septuagint are also listed 17 codices, some of the 5th and 6th century; seven Psalters of the 9th or 10th century; and 18 fragments.

C. Vellum Minuscule Manuscripts.— More than 300 are known but not classified. Few bear witness to the entire Old Testament; the greater part are Psalters. The most critical use of the minuscules of the Septuagint is evidenced by Brooke and McLean, 'The Old Testament in Greek' (Vol. I, *The Octateuch*, 1906–17).

Bibliography.— Swete, 'Introduction to the Old Testament in Greek' (1900), and 'The Old Test. in Greek' (3d ed. of Vols. I and II, 1907; 4th ed. of Vol. III, 1912); Kenyon, 'Our Bible and the Ancient Manuscripts' (1898); Nestle, 'Septuagintastudien' (1886–1907).

2°. New Testament Greek Manuscripts.— According to Von Soden ('Die Schriften des Neuen Testaments in ihrer ältesten erreichbare

Textgestalt,' 1902), 2,328 Greek New Testament manuscripts are extant; only about 40 contain, either entire or in part, all the books; 1,716 are of the Gospels, 531 of Acts, 628 of the Pauline Epistles, 219 of Apocalypse.

A. Papyrus.—About 31 papyrus fragments, of which six belong to the 3d century, bear most important witness to parts of 12 books of the New Testament. Consult Milligan, 'Greek Papyri' (1912), and 'The New Testament Documents' (1913).

B. Vellum Uncials.— Besides Aleph, A. B. C, already described, there are some 160 vellum uncials of the New Testament; 110 contain the Gospels or a part thereof. The most important of these manuscripts are:

D, *Cod. Bezæ,* 5th or 6th century, Cambridge; Gospels and Acts in Greek and Latin, excepting Acts xxii, 29 to end; text, Western, i.e., that of Old Latin and Old Syriac.

D_s, *Cod. Claromontanus,* 6th century, Nat. Libr., Paris; Pauline Epistles in Greek and Latin, each independent of the other.

E, *Cod. Basileensis,* 8th century; Univ. Libr., Basle, Gospels.

E_s, *Cod. Laudianus,* 6th century, Oxford, in Bodleian Libr., Acts in Greek and Latin, same text as D.

E_s, *Cod. Sangermanensis,* 9th century, Imper. Libr., Petrograd, Pauline Epistles in Greek and Latin, same family as D_s.

F, *Cod. Boreeli,* 9th century, Utrecht, Gospels.

F_s, *Cod. Augiensis,* 9th century, Trinity Col., Cambridge, Pauline Epistles in Greek and Latin, same family as D_s, E_s, G_s.

G, *Cod. Wolfii,* 9th century, Cambridge and London, Gospels.

G_s, *Cod. Bœrnerianus,* 9th century, Dresden, Pauline Epistles in Greek and Latin.

Washington Manuscripts, called W and I by Gregory, giving a 5th or 6th century text of Gospels and Pauline Epistles, Smithsonian Institution.

C. Vellum Minuscules.— The vast number of minuscule witnesses to the New Testament text would seem to indicate a rich field of research for the critic. Such is not the case. Ninety-five per cent of these manuscripts are of little moment; they represent an inferior type of text,— that called the *textus receptus.* Only those minuscules attract attention which approach to one of the great uncials. Thus the "Ferrar Group" resemble the text of D.

Bibliography.— Kenyon, 'Textual Criticism of the New Testament' (1912), and 'Paleography of Greek Papyri' (1899); Warfield, 'Textual Criticism of the New Testament' (1886); Tischendorf, 'Novum Testamentum Græce' (1869), together with Gregory's *Prolegomena* thereto (1894); Gregory, 'Canon and Text of the New Testament' (1907); 'Textkritik des Neuen Testaments' (1909), and 'Die Griechieschen Handschriften des Neuen Testaments' (1908); Von Soden, 'Griechisches Neues Testament' (1913), and 'Die Schriften des New Testaments' (4 vols., 1911–13); Nestle, 'Textual Criticism of the Greek Testament' (1901); Hutton, 'Atlas of Textual Criticism' (1911).

IV. Latin Manuscripts.— Epigraphists find far greater variety of script in Latin than in Greek manuscripts. Hence the former are divided into uncials, semi-uncials, capitals, minuscules and cursives: and these divisions are subdivided. The time, place and even the monastery of the copyist may often be traced by the very distinct script of the text.

1°. *Old Latin Manuscripts.*— The origin of the Old Latin text is wrapped in obscurity. Three distinct types are recognized,— the African, European and Italian. The African text is that used by Tertullian (c. 150–220), and Saint Cyprian (c. 200–258); it is the crudest in style, and apparently the earliest to be made. The European text is less crude in style and vocabulary; and may be an independent translation. The Italian text, probably the *Itala* which Saint Augustine preferred to all others, is the version used by Saint Jerome in his revision. About 40 manuscripts preserve this pre-Hieronymian Latin text,— 27 manuscripts of Gospels, seven manuscripts of Acts, six manuscripts of Paul's Epistles, fragments of Catholic Epistles and Apocalypse. All show the influence of the Vulgate or of corrections made by scribes. The most important Old Latin manuscripts are the bilinguals already noted: D, D_s, E_s, E_s, F_s, G_s. Besides there are the codices *Vercellensis,* 4th century; *Veronensis,* 5th century; *Palatinus,* 5th century; *Brixianus,* 6th century; *Corbeiensis,* 5th century; *Gigas,* 13th century; *Palimpsest de Fleury,* 6th century; *Bobiensis,* 4th century. Cf. Burkitt, 'The Old Latin and the Itala' (1896); Wordsworth, Sanday and White, 'Old Latin Biblical Texts' (1883–97); Buchanan, 'Old Latin Biblical Texts' (1907–11) and 'Sacred Latin Texts' (1912–14).

2°. *Vulgate Manuscripts.*— More than 8,000 manuscripts of the Vulgate are extant, most of which are later than the 12th century and of little use in the reconstruction of the sacred text. Wordsworth and White, in their critical text (1889–1905), collate 40 of the most important Vulgate manuscripts. The Benedictine Commission for the Revision of the Vulgate, established by Pope Pius X, is at work on the collation of this vast store of manuscripts; its task is to reconstruct the various families of the Vulgate text,— the Spanish, Italian, Irish, French, etc.,— to sift out the Old Latin readings and other interpolations, and to reach back as nearly as possible to the text that was issued by Saint Jerome. Chiefest among the Vulgate codices are *Amiatinus,* 8th century: *Cavensis,* 9th century; *Fuldensis,* A.D. 541–546; *Kenanensis,* Book of Kells, 8th century; *Stonyhurstensis,* 7th century.

V. Other Versions.—Syriac manuscripts represent six distinctive Syriac versions of the New Testament. The *Old Syriac* version, made about the middle of the 2d century, is represented by two important manuscripts of the 5th century. The Curetonian Syriac manuscript was discovered in 1842 among manuscripts brought to the British Museum from the monastery of S. Maria Deipara, in the Nitrian Desert, Egypt; and was published by Curetor in 1858. The Sinaitic Syriac manuscript was found by Mrs. Lewis and Mrs. Gibson, in 1892, at the monastery of Saint Catherine, on Mount Sinai. Cf. Bensley, Harris and Burkitt, 'The Four Gospels in Syriac transcribed from the Sinaitic Palimpsest' (1894); Lewis, 'Light on the Four Gospels from the Sinai Palimpsest' (1913):

Burkitt, 'Evangelion da Mepharreshe' (1904).

The *Diatessaron* is a Syriac harmony of the Gospels, made about A.D. 170 by Tatian, an Assyrian and disciple of Saint Justin Martyr. The only manuscript records thereof are two Arabic versions, discovered one in Rome and the other in Egypt, which were published by Ciasca in 1888.

The *Peshitta,* or Syriac Vulgate, was made by Rabbula, A.D. 411–435. The Peshitta Pentateuch, dated A.D. 464, in British Museum, is the earliest dated Biblical manuscript. The Peshitta Gospels number 125, Acts 58, Paul's Epistles, 67; two of these New Testament MSS. are of the 5th century.

The *Philoxenian Syriac* version has reached us only in a manuscript of Apocalypse at Trinity College, Dublin, and in the four minor Catholic Epistles.

The *Harklean Syriac* version is witnessed to by 35 manuscripts dating from the 7th century and later; its text is like to that of D.

The *Palestinian Syriac* version is found in lectionaries and fragmentary manuscripts; these latter date from the 11th century and later.

2°. *Armenian Manuscripts* date from A.D. 887, are very numerous and have not yet been accurately collated.

3°. *Coptic Manuscripts.*— By the time Egypt became Christian, the 3d or 4th century, its ancient language had been evolved into the following dialects: Sahidic, or Theban, of Upper Egypt; Akhmîmic, a dialect that was later superseded by Sahidic; Fayûmic, the dialect of Fayûm; Middle Egyptian; Bohairic, or Memphitic, the dialect of Bohaireh,— i.e., of the northwestern province of the Delta. The chief Sahidic manuscripts of the Bible, that have been collated, are among the 58 volumes, discovered (1910) in the Fayûm and now called the Morgan Collection,— six books of the Old Testament and the entire New Testament except the Apocalpyse. The British Museum also has parts of the Old Testament, Acts and Apocalypse. Moreover, the bilingual T, *Cod. Borgianus,* 5th century, in the Vatican, preserves fragments of Mark, Luke and John in both Greek and Sahidic. Bohairic is well represented by manuscripts of the same character as Aleph-B. The *Curzon Catena,* dated A.D. 889, is the earliest extant Bohairic manuscript and is in the Parkham Library. Cf. Crum, 'Catalogue of Coptic Manuscripts in the British Museum' (1905); Wallis Budge, 'Coptic Biblical Texts of Upper Egypt' (1912).

WALTER DRUM, S.J.,
Late Professor of Scripture, Woodstock College, Maryland.

MANUTIUS, mą-nū'shĭ-ŭs, **Aldus** (Ital. Manuzio, Manuzzi and Manucci), Italian printer: b. Sermonetta, near Belletri, in the neighborhood of Rome (and hence sometimes known as Romanus), 1450; d. 6 Feb. 1515. He began his studies at Ferrara, and continued them at Rome where he was tutor to princely families. He learned Greek in Ferrara under Guarini and at the suggestion of the Prince di Carpi established a printing-press at Venice 1489. He gained the reputation of being learned in Greek, Hebrew and Latin and entertained in his house many scholars of the day, forming his "Neacademia" or New Academy, which later was styled "Academia della Fama." He was the author of 'Dictionarium Græcum' (1497); 'Institutiones Græco-Latinæ' (1501–08); 'Grammaticæ Institutiones Græcæ' (1514); 'De Metris Horatianis' (1509). His son PAULUS (b. 12 June 1512; d. 6 April 1574) continued (1533) to manage the printing-press at Venice, and subsequently (1561) presided over the papal press, Typographia Vaticana, at Rome. He wrote a commentary to Cicero's Letters, and 'Epistolæ Selectæ.' ALDUS, the younger son of Paulus (b. 13 Feb. 1547; d. Rome, 28 Oct. 1597), was a scholar and author from his earliest youth. He continued his father's work at Venice and Rome. Consult Renouard, 'Annales de l'Imprimerie des Aldes' (1834); Didot, 'Alde Manuce et l'Hennénisme à Venise' (1873); Goldschmid, 'A Biographical Sketch of the Aldine Press at Venice' (1887); Omont, 'Catalogues des Livres Grecs et Latins, imprimés par Alde Manuce à Venise' (1892). MANX CAT, a breed of house-cats, originating in the Isle of Man, which are characterized by very high hindquarters, and, as a rule, by a very short tail. See CAT.

MANX LITERATURE. The Celtic dialect of the Isle of Man, one of the three subdivisions of the Gaelic language, is closely related to the Irish and the Scottish Gaelic, and nearer to the latter than the former. (See CELTIC LANGUAGES; GAELIC LITERATURE). The literature of the language consisted mainly of ballads and carvels (or Christmas carols). The earliest monument of the vernacular is 'The Book of Common Prayer,' translated by Bishop Phillips in 1610 (reprinted in 1895). In later times the orthography closely followed English. In the middle of the 18th century English was a foreign tongue to about two-thirds of the common people, but since that time the decline in the use of Manx has been very rapid, and only two or three thousand of the islanders now speak it. The last edition of the Bible published in Manx was dated 1819, and the last edition of the New Testament was published in 1840. Consult Rhys, 'Outlines of the Phonology of Manx' (1895); Kelly, 'Practical Grammar of Manxs' (1803; reprinted 1859); Goodwin, 'First Lessons in Manx' (1866); Jenner, 'The Manx Language, Its Grammar, Literature and Present State' (Trans. London Philol. Soc. 1875); Moore, 'Surnames and Place Names of the Isle of Man' (1890); 'Folklore of the Isle of Man' (1891); 'Manx Carols' (1891); and History of the Isle of Man' (1900).

MANZANILLO, măn-thä-nēl'yō, Cuba, city, port of entry, in the western part of the province of Santiago de Cuba, on the Gulf of Guacanabo on the southern shore. It has a large harbor which is protected by a number of small islands. The city is the port for Bayamo, an inland city about 40 miles east by north from Manzanillo. The low land and the mangrove swamps around the place make it very unhealthy. It is well built and has a number of fine churches, hospitals and schools,— among the schools four are high schools. Urban pop. about 25,000.

MANZANILLO, män-sä-nē′yō, seaport, Mexico, on the Pacific coast in the State of Colima, 38 miles west of Colima, the capital of the state. Manzanillo is connected by road and railroad with Colima, and thence with other cities of Mexico. It has been a port of importance since the Spanish conquest. The chief exports are coffee and hides. Pop. (1940) 6,831.

MANZANITA, a popular name for various species of *Arctostaphylos* of the heath family (Ericaceae), especially *A. pungens* and *A. manzanita.* They are shrubs or small trees which sometimes exceed 20 feet in height, and often form impenetrable thickets in the region of the Pacific coast of North America, from Oregon southward. They have alternate, evergreen, entire leaves, usually white or pinkish flowers in panicled racemes, and generally smooth berry-like drupes. Another well-known species often called by this name is the bearberry (q.v.), a trailing evergreen shrub which extends from the Arctic region to the mountains of Mexico, whose red berries form one of the principal foods of ptarmigan and other related birds. The great-berried manzanita (*A. glauca*), a California species, bears fruit more than half an inch in diameter. Of the 30 species of the genus, probably a dozen are used for ornamental purposes: some Central American ones in greenhouses where the climate prevents outdoor use; the shrubby western kinds in mild climates; and only the trailing kinds in cold localities. The gnarled roots are a source of fuel in the untimbered parts of California.

MANZANO MOUNTAINS, a range on the east side of the Rio Grande Valley in Bernalillo, Torrance and Valencia counties southeast of Albuquerque, N. Mex. It extends from Tijeras Canyon on the north to Abo Pass on the south, a distance of 45 miles. The very steep western front of the mountain is granite and schist, capped by a thick sheet of limestone which dips east and constitutes the long sloping plateau of the summit and east side. The highest summits are Manzano Peak, 10,103 feet; Osha Peak, 10,023 feet, and Mosca Peak, 9,723 feet, which are about 5,000 feet above the Rio Grande. To the east is the Estancia Valley, long famous for its salt lakes. Near Bosque Peak is a large spring. The region is forested with yellow pine, piñon and juniper, and is included in the Manzano Forest Reserve. Deer, bear and wild turkeys and many minor wild animals remain in these mountains. Ores of gold, lead and silver are mined on the west slope. Most of the long canyons on the eastern slope contain streams from large springs. The water is utilized by many settlers, mostly Mexicans, who have occupied the region for several centuries. Their small plazas or settlements are Chilili, Tajique, Torreon, Escabosa, Punta del Agua and Manzano. The latter has given its name to the mountains, the plaza taking its name from a grove of apple trees (*manzano* in Spanish) of prehistoric origin. The old ruins of Abo and Quarai are near the south end of the range.

MANZANOS, a natural park in Lincoln, Bernalillo and Santa Fe counties in New Mexico, southeast of Albuquerque. The Manzano Mountains, with several lofty peaks, and numerous tablelands and valleys, with many springs and small streams, are the chief features of this park. The Rio Grande is on the west side; the base of the mountains is about 1,000 feet above the river and about 6,000 feet above the level of the sea. The almost perpendicular, stupendous red cliffs which rise above the plain and form the western face of the mountains are almost unscalable. South of the red-cliff region is the canyon of Las Moyas, and south of this canyon Bosque Peak, one of the high points of the range.

The view from the summit of the range at some points includes the green valley of the Rio Grande, mountains west of Albuquerque and north to the walls of Santa Fe, and intervening valleys and mountains. On the west of the park, or the western border, are the white Manzano salt lands, on the southeast the gypsum desert.

MANZONI, män-dzō′nē, **Alessandro (Francesco Tommaso Antonio),** Italian poet and novelist: b. Milan, March 7, 1785; d. there, May 22, 1873. He studied at Milan and Pavia, and published in 1806 his poem on the death of his friend Carlo Imbonati, which was followed in 1815 by his *Sacred Hymns* (*Inni Sacri*). In 1820 appeared his first tragedy, *Il Conte di Carmagnola,* the first drama in which an Italian defied the unities. This play was reviewed and praised by Goethe, who took a warm interest in every subsequent production of Manzoni. The death of Napoleon inspired one of the finest odes of the century, *Il Cinque Maggio* (*The Fifth of May*). In 1822 his second tragedy, *Adelchi,* appeared. This, as well as its predecessor, finds more favor in personal reading than on the stage. After this Manzoni divided his time between country pursuits at his residence in the neighborhood of Milan and the composition of his romance *I Promessi Sposi* (*The Betrothed*), a Milanese story of the 17th century, published 1825–1827, and which has been translated into most of the European languages (see BETROTHED, THE). Manzoni was devoted to the ideals of Italian independence and unification, participating, with his sons, in the Milanese revolt of 1848, and declining all honors from the Austrians; he became a senator of the Italian kingdom, however, in 1860. His *I Promessi Sposi* is regarded as a model of Italian prose, and its influence, when revised (1840) in the Tuscan dialect, had an important bearing on the establishment of Tuscan as the official form of the Italian language—a development which he warmly supported. Verdi's *Manzoni Requiem* (1874) is a magnificent musical tribute to his memory.

Consult Manzoni, A., *The Betrothed (I Pfomesi Sposi*), tr. by D. J. Connor (New York 1937); De Simone, J. F., *Alessandro Manzoni; Esthetics and Literary Criticism* (New York 1946).

MAO TSE-TUNG, mä′ō dzŭ′dŏŏng′, Chinese Communist leader: b. Shao Shan, Hunan Province, China, 1893. After attending primary and middle school at Changsha, he served in Sun Yat-sen's revolutionary army from 1911 until he resumed his education in 1912 at the Hunan Normal School, where he received his degree in 1918. He then took courses at the National University at Peking. Converted by his own studies of Marx and Engels, and stimulated by the advent of the Russian Revolution (1917), he devoted himself to helping organize the Chinese Communist Party, which came into active existence at Shanghai early in the next decade. In 1922 he became secretary of the branch of the Communist Party in the Province of Hunan, and in 1924 he and other Chinese Communist leaders

joined the Kuomintang headed by Chiang Kai-shek. In April 1927, however, the Communists were ousted by the Nationalists, and Mao fled execution to southern China, where in 1928 he and Chu Teh, later commander in chief of the Chinese Communist armies, organized the Chinese Red Fourth Army, of which Mao became political director. In 1934 Mao's forces broke through opposing Nationalist troops to stage its epic "Long March" from southern China to Yenan in Shensi Province, where Mao, as chairman of the Soviet Republic of China, set up headquarters and prepared the foundations of the Chinese Communist state.

During World War II, Mao and other Communist leaders entered an alliance with Chiang Kai-shek against the Japanese, but in 1945 after the Allied victory over Japan, they resumed their fight against the Nationalists for control of China. By late 1949 Mao and the Chinese Communist armies had succeeded in driving the Nationalists from the Chinese mainland to Formosa, and the Communists had established their capital at Peking. On Oct. 1, 1949, Mao became chairman of the Central People's Government of the People's Republic of China, and on Feb. 4, 1950, at Moscow, after having been present for the celebrations of Premier Joseph Stalin's 70th birthday, he signed a 30-year Sino-Soviet treaty of friendship and mutual defense which replaced the 1945 Soviet treaty with the Chinese Nationalists.

Mao is well known for his political writings, which include: *Red China* (1934), *China and the Second Imperialist World War* (1939), *China's New Democracy* (1944), and *On Coalition Government* (1945).

MAORIS, mä'ô-rĭz, mou'rĭz, or mä'rĭz, a Polynesian people inhabiting New Zealand. Their traditional clothing is a loose garment woven from *harakeke* (New Zealand flax, *Phormium tenax*). Tattooing is a highly developed art among them. They formerly tattooed the faces of a young warrior after his first successful combat, adding fresh designs for each new exploit. Their religion combined ancestral cult with deification of natural forces; they held that the soul was distinct from the body, and survived it. *Tapu* (taboo) was a strong force. Social organization, founded on kinship through common descent, is evidently a remnant of the waves of immigration, the most important of which was the "fleet" of about 1350 A.D. The largest unit is the *waka* (canoe), a loose affiliation of *iwi* (tribes), which are subdivided into *hapu* (clans), and these into *whanau* (family groups). The villages (*kainga*) are usually built around a central meeting place (*marae*), and were usually situated near a fort (*pa*) for defense. Before the coming of Europeans, they lived mainly on agricultural products (particularly the *kumara,* sweet potato), other roots and fish. See also NEW ZEALAND.

MAP, măp (Latinized as MAPES, mā'pēz), **Walter,** Welsh(?) poet and wit: b. probably in Herefordshire, about 1140; d. about 1209. He studied at the University of Paris and became a favorite at the court of Henry II. He attended the Lateran Council of 1179, and was appointed archdeacon of Oxford in 1197. Map is now generally believed to have been probably author, or in large part author, of *Lancelot* in the Arthurian cycle. It is extremely probable, at any rate, that Map did contribute to the bringing of the cycle into its present state, but it is uncertain to what extent his work has survived. He is undoubtedly the author of a curious book *De Nugis Curialium* (*Courtiers' Triflings*), a notebook of the events of the day and of court gossip. It was edited for the Camden Society in 1850 by Thomas Wright. To Map is attributed the famous drinking song beginning:

"Meum est propositum in taberna mori."

MAP. The word derives from the Latin *mappa* meaning napkin, cloth, sheet (just as we speak now of topographic "sheets"). A map is a symbolized picture of the Earth pattern drawn to scale on a horizontal projection, to which lettering usually is added for identification. Abstraction and symbolization often go far from the original conception of a picture, as for instance on a political map.

Scale.—Every map is on a definite size relationship with the part of the land it represents, which can be expressed in three different ways:

(1) Numerical scale, or representative fraction, as 1:1,000,000, meaning that one inch on a map represents 1,000,000 inches in nature, or nearly 16 miles.

(2) Inch to mile scale, as 1 inch to 8 miles (1:506,880), meaning that one inch on the map represents 8 miles in nature.

(3) Graphic scale, as 0 |_____|_____| 10 miles, which has the advantage that it remains true even if the map is photographed larger or smaller.

Enlarging and Reducing Maps.—Changing the scale of maps can be accomplished by:

(a) The quadrangle method, by drawing closely set nets of parallels and meridians both on the original map and for the new drawing on larger or smaller scale. All features are filled in by hand. This method is especially good if the projection system is also changed.

(b) Photostat or photograph, which, however, often shows some distortion.

(c) Pantograph, which instrument is based on a parallelogram with free moving angles and can enlarge or reduce drawings with great precision.

(d) By various arrangements of lenses, mirrors, or prisms an enlarged or reduced image can be projected upon the drawing paper.

Maps on a scale of 1:1,000,000 and smaller are called *small-scale* maps; *large-scale* maps are over 1:100,000; in between are *medium-scale* maps.

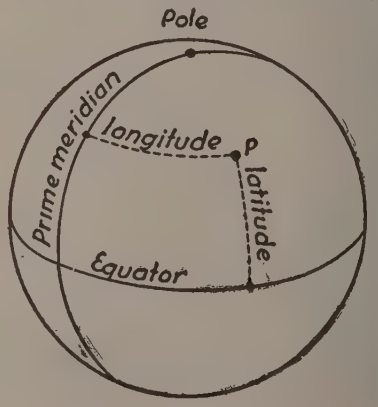

FIG. 1.—Latitude and longitude.

Parallels and Meridians.—The ancient Greeks established a co-ordinate system dividing the arc between the equator and the poles into 90° in parallel circles which get smaller nearer the equator. Similarly the equator is divided into 360 parts and through the division points and the two poles are 180 semicircles or meridians. Distance from the equator measured along a meridian and expressed in degrees (minutes and seconds) is called *latitude*. Distance in degrees reckoned from a chosen *prime meridian* measured along a parallel is called *longitude*. While all degrees of latitude are equally long (about 69 miles), degrees of latitude vary from 69.17 miles at the equator to 0 at the pole. For any degree

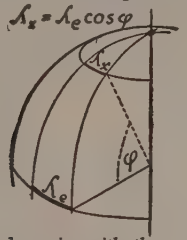

FIG. 2.—Longitude varies with the cosine of the latitude. λ_x=longitude on any parallel. λ_e=longitude on the equator. ϕ=latitude.

of longitude where ϕ is the latitude, for instance 1° of longitude at lat. 60° is one half of 1° long. at the equator, cos 60° being 0.5.

In all these considerations the Earth is regarded as a perfect sphere. As the exact form of the Earth is more nearly a rotational ellipsoid, the degrees of latitude are slightly smaller near the equator, 68.7 miles, and larger near the poles, 69.2 miles. Prime meridians changed a great deal during history from the Fortunate Islands of Ptolemy to Ferro (q.v.) in the Canary Islands. Even Washington, Philadelphia, Boston, and Hartford were used as prime meridians. By international agreement, at present the meridian at the Royal Observatory in Greenwich, England, is used for prime meridian.

Most maps are oriented with north on top, but this is conventional. Other orientations are often used at present to bring out hidden relationships.

Projections.—The spherical surface of a globe cannot be flattened into a map without stretching or tearing. If only a small part of the Earth's surface is shown, as on large-scale maps, distortion is negligible, but on medium-scale maps, and especially small-scale maps of the whole Earth, considerable distortion is necessary.

Several geometrical methods were tried. If the globe is enveloped into a cylinder and the surface is projected upon this surface and then the cylinder is cut open and laid out flat, we have a *cylindrical projection*. Similarly, if we cap the globe with a conical hat, project upon the cone, split open the cone along one of its elements and lay it out flat, we have a *conical projection*. Also, if the surface of the globe is projected upon a tangent board from some eye point at a selected distance, we have an *azimuthal projection*.

These projections are derived from actual perspective projection from a point or points upon a surface. Except for a few azimuthal projections, however, no perspective projections are in actual use. Most of them are simply some kind of network of parallels and meridians to suit the map maker's purpose. A map projection can be defined as *any orderly network of parallels and meridians upon which a map can be drawn.*

As the problem of flattening spherical surfaces is impossible, there can be no perfect projection. We can choose from dozens of imperfect solutions the one which is most suitable for our particular purpose. Some projections have special merits. *Equal-area* or *equivalent* projections are those in which every part of the map, and the map as a whole, has the same area as the corresponding part of the Earth's surface. To achieve this, shapes and angles have to be considerably distorted. *Conformal* or *orthomorphic* projections are those in which every small portion has the same shape as the corresponding part on the globe. Not only are the parallels and meridians right angles to each other, but they have also the correct proportions. To achieve this, the scale of the map has to vary a great deal. Some projections are not equal-area nor conformal but have small scale errors.

It is obvious from the foregoing that on any map only the parallels or only the meridians or certain other lines can be true to scale; all other distances are distorted. Which lines are selected to be *true to scale,* that is the same scale as on the corresponding globe, is the fundamental consideration in projections. Several hundred projections occur but only a few selected projections are presented here.

Rectangular Even-spaced Projection.—This is the simplest of projections, consisting of even-spaced horizontal parallels and vertical even-spaced meridians. Meridians are spaced on the central parallel of the map according to

$$\lambda_x = \lambda_e \cos\phi$$ (see Fig. 2).

Mercator Projection.—The equator is divided truly for vertical meridians. Parallels are horizontal, spaced conformally; that is, their relation

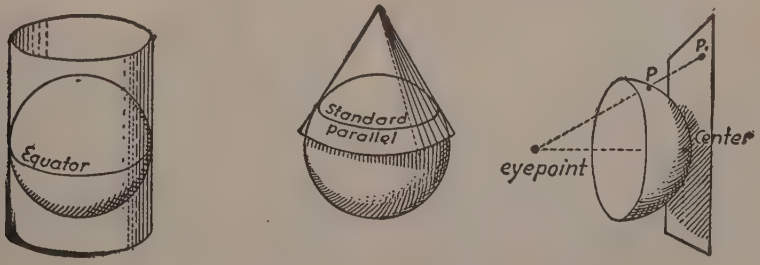

FIG. 3.—Cylindrical, conical and azimuthal projections.

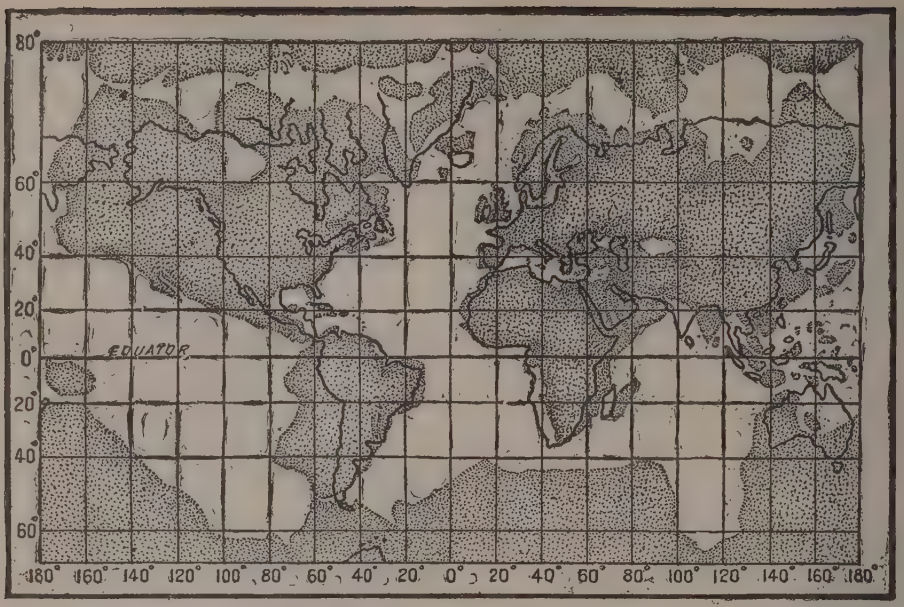

FIG. 4.—Mercator's projection from his World Map of 1569. Mercator's delineation of the land is dotted.

to the meridian is the same as on the globe. On the globe the meridians converge, but in this projection they are parallel. To get the correct proportion, the parallels are spaced at increasing distances toward the poles. The poles are at infinite distance.

The chief merit of the projection is that compass directions, or rhumb lines, appear as straight lines. (On the surface of the globe they spiral towards the poles.) For this reason the projection is ideal for navigation, in spite of the enormous variation of scale. It is less good for world maps for which it is frequently used. The projection was delineated by Gerardus Mercator, the great Belgian cartographer, in 1569 (see Fig. 4).

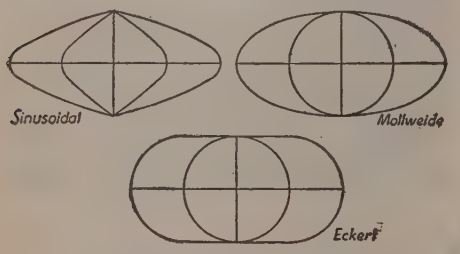

FIG. 5.—Outlines of the world and the hemisphere in various projections with horizontal parallels.

Other Projections.—Among other projections with horizontal parallels and vertical meridians, mention should be made of the Gall's projection and also of Miller's cylindrical projection, in which the parallels are spaced at increasing distances nearer the poles but not so much as in the Mercator projection.

The *sinusoidal* and the *Mollweide,* or *homolographic,* projections have both horizontal parallels but the meridians converge toward the poles. Both projections are equal-area. The *Eckert* projection is similar, but the poles are represented as lines half the length of the equator. All these projections are popular for world maps and continent maps.

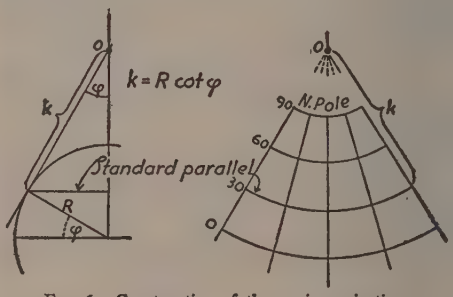

FIG. 6.—Construction of the conic projection.

In the *conic* projection, the globe is capped by a cone which touches it along a selected standard parallel. The radius of this standard parallel is $1=R \cot \phi$. The standard parallel is obviously divided truly; the meridians are radiating straight lines, placed truly on the standard parallel, and the parallels are concentric circles. For best results usually the central parallel of the map is taken as standard. The spacing of the parallels would be uneven in the actually projected network. In the practically used conic projection, the parallels are concentric circles placed at their true distances. The projection is used for country and continent maps in the tem-

perate zones on account of its small scale error. The scale error is further reduced in the *conic projection with two standard parallels*. On a map of the United States the maximum scale error would not exceed 1.25 per cent.

By different spacing of the parallels, this projection can be made equal-area. The *Albers conical equal-area* projection is adopted as the best projection for the country by the United States Geological Survey. By spacing the parallels differently, the projection can be made conformal. The *Lambert conformal conic* projection has relatively straight azimuths for which it is generally used for air navigation charts.

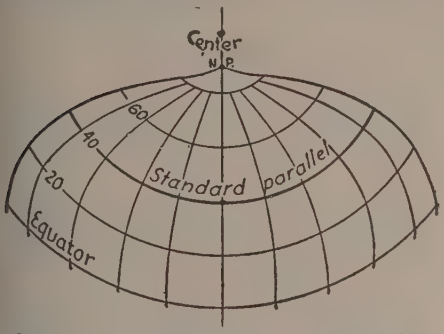

FIG. 7.—Bonne projection of the half-hemisphere centered on lat. 40° N.

The *Bonne* projection is similar to the simple conic, except that not only the standard parallel, but all parallels are divided truly, which makes the meridians curved and the projection equal-area. It is a popular all-around projection, used for all scales, from world maps to topographic sheets.

The *polyconic* projection has a truly divided vertical central meridian. The parallels are non-concentric circles, each with a radius $1=R \cot \phi$, as if each would derive from a tangent cone. Each parallel is divided truly, the connecting lines form the meridians. The United States Geological Survey topographic sheets are on this projection.

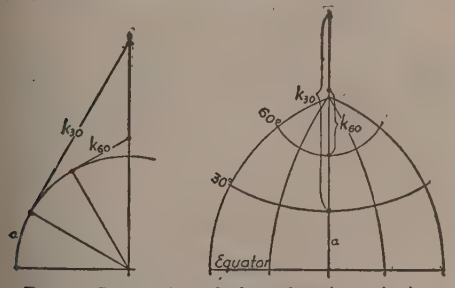

FIG. 8.—Construction of the polyconic projection.

The *azimuthal* projections derive from projecting a part of the earth's surface upon a plane surface from an eye point. The plane can be tangent at the pole, at the equator, or any other point, and all three views—polar, equatorial, and oblique—are often used.

In the *gnomonic* projection the eye point is in the center of the sphere. The projection has extreme distortions of size and shape, but it shows all great circles as straight lines, for which it is used for laying out transoceanic sailing and flying routes. The meridians are straight lines; the parallels are hyperbolas.

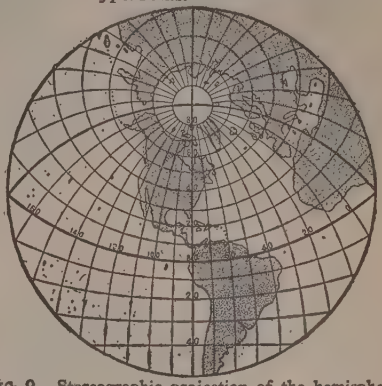

FIG. 9.—Stereographic projection of the hemisphere in oblique view.

In the *stereographic* projection the eye point is at the antipodal point of the center of the map. The projection has the interesting property that not only all parallels and meridians, but also all other circular lines of the globe appear as circles on the map too. It is a conformal projection, but it is not much used on account of its considerable distortion of scale.

The eye point of the *orthographic* projection is in the infinite; the rays are parallel. The parallels and the meridians are elipses, ranging from a straight line to a circle. The great merit of this projection is its visual quality—it looks like a globe. Although the distortion on the sides of the man is enormous, we see everything in correct proportion because we perceive not a map but a picture of a three-dimensional globe. For this reason it became very popular for so-called «global» maps.

Two azimuthal projections do not derive from direct perspective methods. The *azimuthal equidistant* projection is the only one in which every point is shown, not only the correct distance, but also in correct direction (azimuth) from the center point. All other distances and directions, however, are distorted. The *Lambert azimuthal equal-area* projection is very good for hemispheres and for continent maps.

Besides these, a number of interrupted, star-formed, and other projections are used. Among these the butterfly projection of B. T. S. Cahill is particularly attractive. Another interesting group of projections derives from the oblique, or transversal development of the cylindrical and related projections. The transverse Mercator projection is particularly interesting and used for the new maps of the British Ordnance Survey.

Symbols.—As all geographic information of the map is given with the help of symbols, a good symbol is one which can be recognized without a legend, yet is simple, distinct, and does not take up more space than its importance allows. Lines, patterns, and colors can all be used. Symbols are different on small-scale maps and on large-scale maps, and it makes a great deal of difference whether colors can be used or not.

Standardization of symbols is necessary by government agencies. Private cartographers, not hampered by such regulations, are in a position

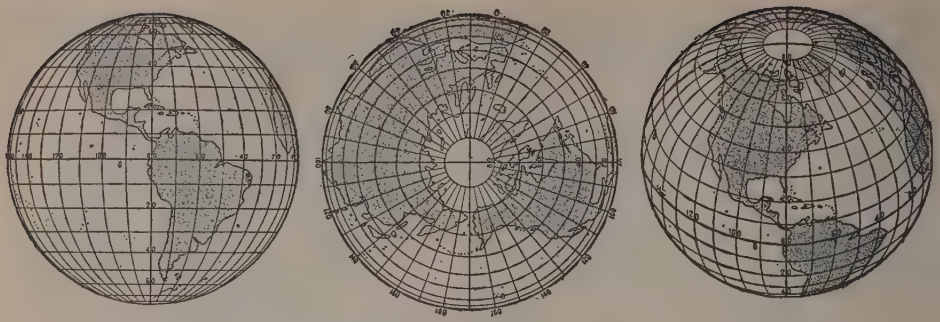

Fig. 10.—Orthographic projection of the hemisphere in equatorial, polar, and oblique views.

to design new and better symbols. Airplane photography presents a rich pattern of the earth's surface which our present symbols are not quite able to express, and a major change is expected in the appearance of maps in the future.

If colors can be used, the conventional color of *hydrography* (water features) is blue; for *hypsography* (relief features, such as hills and mountains) brown; and for *culture* or man-made features, black and red. Vegetation is usually shown with green symbols.

Relief Features.—The representation of mountains is a particularly difficult problem of cartography, essentially because we represent the mountains on maps as seen from above, while our familiar conception of mountains is as they look from below. Several methods are in use.

Hachuring.—This is the older type of representation of relief, and is usually applied to black-and-white maps. Slopes are shown by lines of variable thickness running along the «dip» of the slope, the way water would run upon that surface. The steeper the slope, the thicker the line. The method was systematized by F. G. Lehmann, a Saxonian officer in Napoleon's army.

Plastic Shading.—This method requires reproduction by half-tone method, which limits its use. Two methods are used. In «vertical illumination» the steeper the slope, the darker the tone (as in hachuring). This method is used by the topographic sheets of Norway. Much more common is «oblique illumination,» somewhat as a plaster model of the region would look lighted sideways but photographed from above. This method is often used in combination with contour lines.

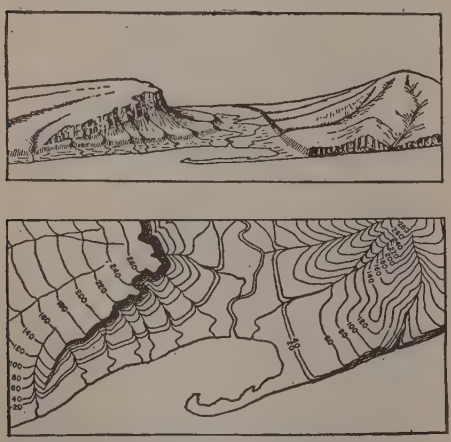

Fig. 11.—Topographical features expressed by contour lines. After the U.S. Geol. Survey.

Contour Lines.—These are continuous lines connecting places of the same altitude above a datum plane, drawn along selected regular intervals. All points between two contour lines have to be at intermediate elevation. Steep slopes produce close intervals; on gentle slopes the contour lines are far apart. The exact angle between contour lines can be expressed by «feet per mile,» or graphically by «profiles.» All contour lines are horizontal and perpendicular to hachure lines. The contour interval varies with the scale of the map and the ruggedness of the land. The 1:62,000 topographic sheets of the United States have 20-foot intervals in hilly country. The datum plane is mean sea level.

Lettering.—Letters obscure by their bulk much topographic detail on maps, and they are kept as small and fine as legibility will permit. If letters are applied to an area, they are spread so as to indicate the trend or extent of the area. Letters are sometimes hand-drawn, but stamped, pasted, or templeted letters are also common. Most United States maps have «slanted» letters for hydrography, «block» or «gothic» letters for relief features, and «Roman» letters for political units.

Composition.—Sectional maps—parts of a larger map—fill a quadrangle between two parallels and two meridians, and title, scale, key, name, authorities, glossary, and all other «marginal information» are set up outside the map. Maps of a unit region, however, have often all this pertinent information collected in a «cartouche» inside the frame of the map. Much empty space can be taken up by «insets.» These insets either show an important portion on a larger scale, or the location of the region on a smaller-scale map.

Reproduction.—Maps are drawn usually 1½ to 3 times the publication size to obtain finer detail. The most common method of reproduction is by offset planography. Only if the map has to be printed together with type is it reproduced by photoengraving (q.v.). Color maps are usually printed from separate color plates drawn on separate papers. Maps reproduced in four-color process are also common. (See Lithography.)

Charts.—Marine charts for navigation differ from land maps chiefly by their emphasis on the sea. They show submarine contours, usually ob-

tained by sounding. Almost all charts are on the Mercator projection. The datum plane is usually a low-water level for sounding, and a high-water level for land features. Charting has been greatly helped by the sonic depth finder instruments and from radar, which helps to locate exactly the point of the surveying vessel. The charts of coasts of the United States and territories are surveyed and prepared by the United States Coast and Geodetic Survey, while those of foreign waters are published by the United States Hydrographic Office (qq.v.). See also article on CHART.

Topographic Maps.—Every civilized country publishes detailed general maps of the land on 1:25,000–1:100,000 scale. In the majority of countries these maps are prepared by the army. Relief is usually shown by contours, but in reconnaissance maps plastic shading is common. The topographic sheets of the United States are prepared by the United States Geological Survey (q.v.) and also by the Corps of Engineers. The fine topographic sheets of England are prepared by the British Ordnance Survey.

Air Navigation Maps.—These are usually published on 1:500,000 to 1:1,000,000 scale, using contour lines with altitude tilts, and show all features which help airmen, especially radio beacons. The United States Army Map Service has prepared air navigation maps on 1:1,000,000 scale of the entire world.

Military Grids.—All new topographic maps have a grid system of even squares overprinted, for easier location of spots. These grid systems are drawn upon a standard map in a specified projection and grid distances and directions are not true on any map on another projection, but as long as the area involved is small, there is not much difference. In the United States Progressive Military Grid System, the country is divided into seven grid zones, and a 1,000-yard square grid is drawn upon a polyconic projection.

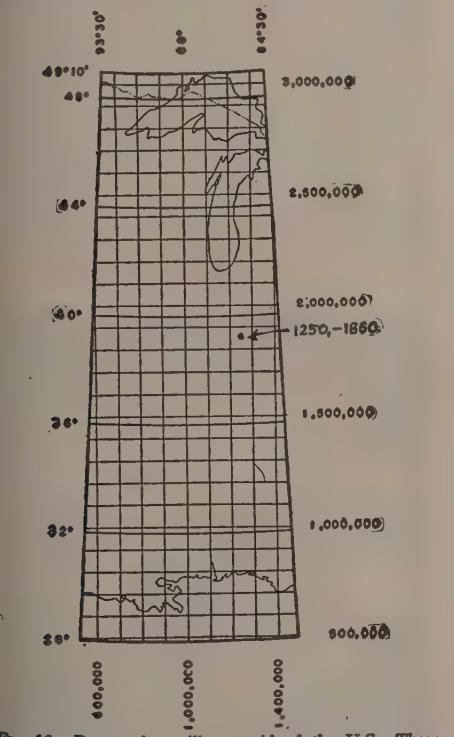

FIG. 12.—Progressive military grid of the U.S. There are seven grid zones. This is Grid Zone C.

Statistical Maps.—These maps show quantitatively the distribution of a certain variable, as, for instance, rainfall, acreage of wheat, religions of people. Three methods are used: (1) isopleths, which are lines connecting equal values; (2) dot system; and (3) superimposed diagrams. The last is recommended whenever the distribution is highly variable or has to be subdivided. «Density of population» maps are the most important in this group. Usually a combination of the dot system and superimposed circular graphs are used on them.

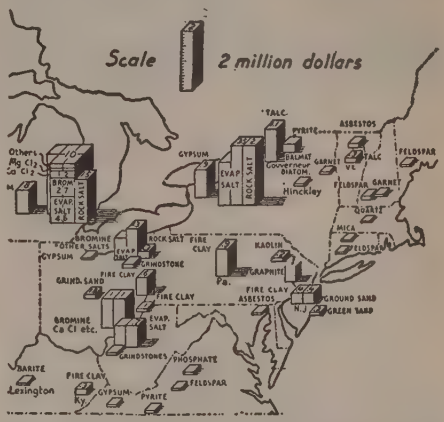

FIG. 13.—Statistical map with superimposed diagrams, showing the nonmetallic mineral production of the northeastern U.S.*

Cartograms.—Highly abstracted diagrammatic maps are called cartograms and are used much in statistical mapping and for showing the distribution or relations of distributions of certain variables over the earth.

Land Utilization Maps.—These indicate forest, meadow, various types of cultivation, etc., and form the most important type of maps in modern cartography. Various colors, patterns, index numbers and figures are used.

Scientific Maps.—This type of map is published in increasing numbers in atlases, books, and periodicals. Not only do the Earth sciences, such as geology, meteorology, climatology, oceanography, seismology, astronomy, plant geography, and zoogeography use maps as an essential part of their presentation, but also economics, history, sociology, etc., use maps in increasing numbers.

School maps, wall maps, city maps, railway, auto-road maps, maps of art and advertising, are just a few more items each of which has its own specialized cartography. See also GLOBE.

History.—The ability of making maps is an inherent quality of mankind. Primitive people are able to draw maps of large areas in vertical projection without any difficulty. The Eskimos, the Indians, the nomads of Asia and Africa, and

the South Sea Islanders are excellent map makers.

The oldest maps which survived were made by the ancient Babylonians, but records indicate that the Egyptians, Persians, and Phoenicians also made maps, few of which survived, however.

Cartography as a science was established by the ancient Greeks. The Ionian geographers of the 5th and 6th centuries B.C. drew the earth in the form of a disk floating in the oceans. In the 4th century, an oblong earth was drawn from which our expressions latitude and longitude derive. At the same time arose the idea of a spherical earth, and it was a well-established fact in the time of Aristotle. The tilt of the ecliptic was accurately measured and the equator, poles, tropics, zones were defined. The size of the earth was measured by Eratosthenes of Alexandria in the 3d century (with an error of less than 14 per cent, 28,000 miles circumference), and later by Posidonius, who, however, figured it one-third too small. This latter measurement was accepted by Ptolemy and influenced Paolo dal Pozzo Toscanelli and Columbus (qq.v.). Eratosthenes prepared a map also showing certain principal parallels and meridians in which he was attacked by Hipparchus, who advocated an even system of parallels and meridians dividing the circle into 360°, as we still use it at the present time.

The only Greek map which survived was an atlas of Claudius Ptolemy of Alexandria about 150 A.D. Much of his material is based on the Phoenician, Marinus of Tyre. His atlas, a supplement of his 8-volume *Geography,* consists of 27 detailed maps and a map of the known world. His delineation had an immense influence upon the cartography of the Renaissance, and some of his mistakes did not disappear from maps until the 18th century.

Fig. 15.—Outline of Ptolemy's World Map.

Roman cartography did not continue the scientific attitude of the Greeks. They preferred a simple map to be used for administrative and military purposes. For this they returned to the disk-like earth of the early Greeks and the Roman *Orbis Terrarum* became the standard map of the world for 13 centuries. It has east on top and we still speak of «orientation.» Most of the map is an exaggerated representation of the Roman Empire with the rest of the world represented only as outlying provinces. A peculiar Roman product was the *Tabula Peutingeriana* (see PEUTINGER'S TABLE) from the 4th century A.D., made by Castorius in which Roman roads are delineated on an enormously elongated scroll 22 feet long and only 1 foot wide. A good medieval copy of this map survived.

The early Middle Ages added little to cartography. A great number of crude maps survived in various codices, but they were mostly copies of the *Orbis Terrarum.* Further diagrammatization of this map resulted in the T-in-O maps (*Orbis Terrarum*) with Jerusalem in the center. These maps, with their regularity, ap-

Fig. 16.—The Orbis Terrarum of the Romans. From E. Raisz: *General Cartography* (McGraw-Hill 1938).

pealed greatly to the medieval mind, not interested so much in reality but in divine harmony. A good map of England was prepared by Matthew Paris (q.v.) in St. Albans, c. 1250.

The Arabs are credited with the first school atlases dating back to the 10th century, showing highly diagrammatic maps. They measured the size of the earth with great accuracy. Their tables of latitudes and longitudes surpass anything prior. The most famous Arab map is the large world map of Idrisi (Edrisi) (1154) of rich detail. It shows, however, Christian influence as it was prepared in the court of King Roger II of Sicily.

FIG. 17.—T in ○ map from the 11th century.

Portolan Charts.—These charts appeared around 1300 and seem to be the copy of a remarkable early chart showing the Mediterranean and Black Seas with surprising accuracy. Indeed, this chart was used for actual navigation for three centuries. Over a hundred copies are known, with but few additions and improvements. The original portolan chart was based on an organized compass survey, probably under the Genoese Admiralty.

The Great Discoveries.—The introduction of the compass and improved sailing vessels made possible the voyages of Columbus, Magellan, and others. These great discoveries caused a revolution in map making, as America and its relation to Asia had to be explained to the public. The outlines of four maps below show the confusion which prevailed in the minds of cartographers in the early 16th century. Juan de la Cosa's map

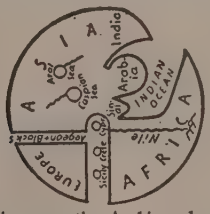

FIG. 18.—Diagrammatic Arabic schoolmap from the 10th century.

of 1500, if its date is correct (which is doubtful), is the earliest representation of the Americas. Martin Waldseemüller's (q.v.) map is the godfather of America, as it was the first to name the continent so. Diogo Ribero's map is a copy of the *padron real* or royal map of Spain. This is the first real world map showing the immensity of the Pacific Ocean, with China and India in their proper locations.

Engraving and Printing.—Hitherto all maps were manuscript and reproduced by hand. The invention of engraving and printing made maps very much cheaper and the flow of new information was facilitated. Woodcut maps were common at the end of the 15th century, but gradu-

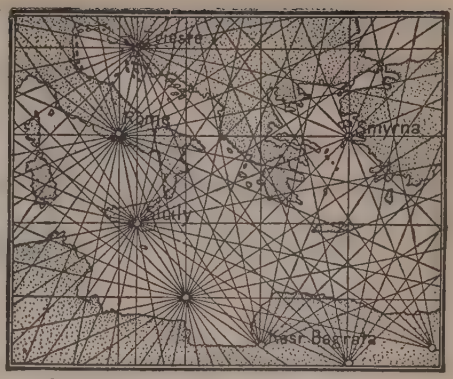

FIG. 19.—Portion of Portolan Chart, c. 1300.

ally copper engraving became the generally used method. Waldseemüller's map was engraved in copper.

Rediscovery of Ptolemy.—Ptolemy's map survived chiefly through the Arabic scholars. His work was translated into Latin around 1410 and since then it was republished perhaps a hundred times, mostly with the addition of new *Tabulae Modernae.* So great was the authority of Ptolemy that Waldseemüller replaced the good outline of the Mediterranean of the portolan charts with the far worse outline of Ptolemy.

The Dutch School.—The Low Countries, situated between England, France, and Germany, and subject to Spain, had good opportunity to obtain information from these countries. Dutch industry and talent supplied the rest, and in the 16th and 17th centuries the Low Countries were the leaders in the map making of Europe. Gerardus Mercator (q.v.) of Louvain is called the father of Dutch cartography. The projection bearing his name appeared in 1569 (see Fig. 4). Hundreds of maps embodying remarkably correct information and restrained, yet artistic rendering, bear his name. Abraham Ortelius (q.v.) published the earliest modern atlas, the *Theatrum Orbis Terrarum,* in 1570. Jodocus Hondius and Jan Janszoon followed the Mercator tradition. The House of Blaeu in Amsterdam produced perhaps the best maps of the Renaissance. Among the later Dutch map houses, the Visshers, the Donckerts, Schenck, Allard, and De Witt should be mentioned. The father of English cartography is Charles Saxton (d. 1611); his county maps are superb. The atlases of Norden, Speed, Goss, Pitt, and Seller closely followed the Dutch style.

Surveying Methods.—Hitherto almost all maps were the result of development: one person made a map, his successors improved it, and gradually a fair representation developed, supported by a few latitude measurements, otherwise unsurveyed. Yet the principles of triangulation are described by Gemma Frisius in 1526, and Willem Janszoon Blaeu actually triangulated a portion of Holland. At the end of the 17th century, the sextant, telescopic theodolite, the planetable, the barometer, and accurate pendulum clocks were available for land measurements.

The French School.—Modern cartography dates from the longitude measurements of the French Academy around 1680. About 80 longitudes were accurately measured by simultaneous

FIG. 20.—Famous map of 1529.

observations of the occulations of the satellites of Jupiter, as chronometers were not yet available. The results of these measurements were laid down on a polar map, covering the floor of the Paris Observatory, by Jean Dominique Cassini. French cartographers of the 18th century excelled in fine, accurate work, critical, scientific attitude, and less inclination for decoration. Outstanding men were Guillaume Delisle, Jean Baptiste Bourguignon d'Anville, Gilles, and Didier Robert de Vaugondy, J. N. Bellin, Philippe Buache, Rigobert Bonne and many others.

The English School.—Early British cartography was under Dutch influence. In the 18th century the fine French style prevailed, but by the end of the 18th century the British even surpassed the French in the number and excellency of their maps. The maps of John and Thomas Bowles, Thomas Jefferys, William Faden, John Rocque, John Cary, and Aaron Arrowsmith were popular even in America.

National Surveys.—The triangulation of France was organized by the Academy of Sciences under César François Cassini de Thury and accomplished in 1744. The preparation of detailed topographic sheets was the further life work of this great cartographer. This was the first great national survey, which was soon followed by Austrian Belgium, and the British Ordnance Survey 1791. In the 19th century every civilized nation produced its topographic sheets.

Diversification of Cartography.—The 19th century witnessed a great diversification of cartography. Geologic maps of William Smith, school maps of Emil Sydow, physical maps of Karl Ritter, atlases of meteorology and climates of John Bartholomew, relief models of Albert Heim, historical map reproductions of Jomard and Konrad Miller, are just a few examples of various tasks which found a cartographic answer. The International 1:1,000,000 Map of the World is the first great experiment in international cooperation in mapping.

American Cartography.—The oldest map wholly produced and published in America is John Foster's woodcut of New England from 1677. The Bonner map of Boston of 1722 is the first large city map. Lewis Evans' *Middle British Colonies* in 1755 is the most outstanding colonial map. The British naval and military maps, previous to the Revolution, by Samuel Holland (New York, New England); John Gascoigne (South Carolina, Georgia); G. Gould (Florida); Ross (Mississippi River); Wm. Brassier (Lake Champlain); J. Montresor (New York state); John Hills (New Jersey); and many others formed a fundament for the later maps of the United States. Washington's surveyors, Thomas Hutchins, Simeon De Witt (qq.v.), and others, organized the official cartography of the new state. In the early 19th century almost every state of the Union prepared a state map on 4 to 8 miles to the inch scale. Atlases were published in great numbers since Matthew Carey's *General Atlas,* 1794. Especially famous is Henry S. Tanner's *New American Atlas,* 1823. The two Tanner brothers, John Melish, Samuel Augustus Mitchell, and later the Colton family, were especially productive.

Wax engraving was invented by Sidney Edwards Morse; his *Cerographic Atlas* appeared in 1841. This method, with its stamped-in names and mechanical appearance, imprinted its style upon American cartography for a century. More individual maps were produced by lithography which was introduced around 1827. The county atlases of the second half of the 19th century are typical American products, and their production became a national industry.

The early explorations and mapping of the rapidly expanding country were chiefly due to the army. William Clark's map of 1810 of the Lewis-Clark transcontinental expedition; Major Stephen H. Long's map of the Platte River; Benjamin L. E. Bonneville's map of the Great Basin; Joseph N. Nicollet's map of Minnesota; John Charles Frémont's map of the West are just a few witnesses to the outstanding work of these men under constant danger from Indians.

The westward migration of people was preceded by the host of surveyors commissioned by the General Land Office to make township plots. These men did remarkable work in incredibly short time, but often characterized more by speed than accuracy.

The Coast Survey was established in 1807 under the directorship of Ferdinand Hassler of Switzerland; the first charts, however, did not appear until 1845. This office is responsible for the leveling and triangulation of the country and since 1878 it has carried the name United States Coast and Geodetic Survey.

The many competing surveys of the West were collected in 1878 into the United States Geological Survey, which is in charge of the

topographic mapping of the country. At the beginning of the Second World War less than half of the country was topographically surveyed. The coverage, however, was greatly expanded by the United States Corps of Engineers in recent years.

Before the war, 24 federal agencies in Washington alone produced all kinds of special maps. Add to this the maps of the various local and state agencies, the number of official maps produced yearly runs into the hundred thousands. Even this production was superceded during the war, when the Army Map Service, the Coast and Geodetic Survey, and the navy produced maps especially of foreign countries with unprecedented speed. Much of this work was aided by airplane photography.

Lecturer on Cartography, Institute of Geographical Exploration, Harvard University.

MAPES, māps, **Victor,** American playwright: b. New York, 10 March 1870. He was graduated from Columbia in 1891, was dramatic critic of the New York *World* 1898–99 and manager of New Theatre Chicago (1906–07). He wrote *Duse and the French* (1897); *Partners Three* (1909); *Gilded Way* (1911); and directed *The Tory's Guest* (1900); *Don Caesar's Return* (1901); *The Dectective* (1908); *The Boomerang* (with Winchell Smith, 1915); *The Amethyst* (1925). D. 27 Sept. 1943.

MAPLE, a genus (*Acer*) of trees, together with a few shrubs of the family *Aceraceæ.* The species, of which there are about 100, are indigenous to the north temperate zone, being best represented in China, Japan, United States and Canada. They are characterized by opposite, palmate or lobed, exstipulate leaves; small polygamo-dioecious flowers in axillary corymbs or racemes; and compound, one- or two-seeded, long-winged nuts (samaras). The maples constitute one of the most widely useful genera of trees, being extensively employed for ornamental and street planting and for windbreaks, while the wood serves well for toolhandles, furniture, flooring and many other purposes. The flowers are rich in nectar and are sought by bees. Most of the species thrive best upon rich moist land suitable for agricultural purposes and are considered an indication of the type of soil. A few grow in wet land, and many upon mountain sides. They are readily propagated by means of seeds which, in the case of the early maturing kinds, should be sown as soon as ripe, the later ones in autumn or spring, being stratified in sand during the winter. Some choice varieties are grafted or budded and others may be increased by cuttings and layers.

In America, the best known, most widely planted and otherwise most important species is probably the rock or sugar maple (*A. saccharum*), a stately round-headed, gray-barked tree, often attaining heights of 120 feet. It is especially characteristic of rich woods from Maine to Michigan and southward in the mountains to Georgia, everywhere being noted for the rich colors of its leaves in autumn. Besides great popularity for all the purposes mentioned above, some of the trees are highly prized for their wavy-grained wood, which, being of satiny appearance and capable of high polish, is used under the name of curly maple often as veneers for choice furniture. It is further the most important of the species which yield a saccharine sap, and is a chief source of maple syrup and sugar, to obtain which the trees are «tapped,» the sap caught in buckets and evaporated. A yield of three pounds per tree annually is considered very profitable; six pounds or even more is often obtained from many specimens whose sap is either especially abundant or particularly rich in sugar. If properly done no injury results to the trees. A form of the sugar maple, the black maple (*A. saccharinum* var. *nigrum*), so called from its very dark bark, is considered a distinct species (*A. nigrum*) by some botanists. It has the same range and habitats as the preceding and in nearly every respect the same uses, including sugar production. This form is more abundant than the preceding in the Central States.

The silver maple (*A. saccharinum*) is a widely spreading tree which attains a height of 120 feet throughout the same range as the above species. Being very ornamental in form and particularly also because of its graceful leaves, which are silvery white beneath, this tree is widely planted where rapid growth and quick effects are desired. Its chief fault is its brittleness; it quickly succumbs to high winds. It will succeed upon a wide variety of soils. Its sap, though rather sweet, is less useful for sugar than the above-mentioned species.

The red, scarlet or swamp maple (*A. rubrum*) attains heights similar to the above, has about the same range, but is most frequently found in wet ground. It is named from the brilliant color of its flowers, which are borne profusely in early spring before the leaves appear and from its red fruits which appear soon after. Being of good habit it is widely planted for ornamental purposes upon all kinds of soils. Its wood is used for most of the purposes enumerated above.

The Norway maple (*A. platanoides*) is somewhat smaller than the preceding species, being more compact and umbrageous. It is widely planted in private grounds and in parks, but is less valuable for street planting than the above because of its shorter trunk. It is a native of Europe. The sycamore maple (*A.*

pseudoplatanus), another European species, is smaller still, attaining only about 70 feet. It is also widely planted in America as well as in Europe, being a vigorous, rapid grower and succeeding upon a great variety of soils. The common maple (*A. campestre*) occasionally attains 50 feet, but is usually a smaller tree or even a shrub. It is of European origin and is widely planted.

The Japanese maples (*A. japonicum, A. palmatum,* and other species) are small trees or shrubs which because of the great diversity of form of their leaves and their dainty habit have become widely popular in the parks and gardens of the United States and Europe. Their exceptionally brilliant autumnal coloring is taken advantage of in Japan where in the fall they approach the chrysanthemum in popularity.

The maples furnish food for a large number of insects, some of which live upon the green parts and others upon the wood. Several species of scale insects (q.v.) are often abundant enough to do considerable damage. The cottony maple scale (*Pulvinaria vitis*) is among the most troublesome. Several caterpillars live upon the leaves, the forest tent caterpillar (*Malacosoma disstria*), the fall webworm (*Hyphantria cunea*), and the larvae of the white-marked tussock moth (*Hemerocampa leucostigma*) being the most generally important. The maple worm (*Anisota rubicunda*), which is the larva of a moth, is frequently very destructive. Of the borers, the larvae of *Dicerca divericata* and *Glycobius speciosus,* which are beetles in the adult state, and those of *Sesia acerni,* a clear-winged moth, are among the most destructive to maples. The second beetle mentioned is known as the sugar maple borer.

Consult Bailey, L. H., *Standard Cyclopedia of Horticulture* (New York 1944); Peattie, Donald Culross, *A Natural History of Trees of Eastern and Central North America* (Boston 1950); Platt, Rutherford B., *American Trees* (New York 1952).

MAPLE HEIGHTS, city, Ohio, is located in Cuyahoga County in the northeastern part of the state, ten miles southeast of Cleveland of which it is a residential suburb. It was incorporated as a village in 1915 and as a city in 1930, and it has a mayor-council type of government. Pop. (1940) 6,728; (1950) 15,586.

MAPLE SHADE, village, New Jersey, is located in Burlington County in southwestern New Jersey seven miles east of Camden, at an altitude of 40 feet. Served by the Pennsylvania Railroad, it is principally a manufacturing and agricultural center, the chief industries being clothing, paper products, radio parts, and lumber milling. It is in a region of truck, fruit, poultry, and dairy farms. Pop. (1950) 4,200.

MAPLE SUGAR INDUSTRY, a trade term in common use, pertaining to the manufacture of sugar and sirup from the sap of the rock or sugar maple (*Acer saccharum*) or from the sap of the black maple (*Acer nigrum*). The maple trees, which are about forty years old when first tapped, are drilled with small and shallow holes a few feet from the base of the trunk during the spring when the sap is rising. The sap drips into buckets, which are hung on the tree, and the flow continues for several weeks. An average tree yields from 10 to 20 gallons of sap, although from 35 to 50 gallons of sap must be boiled down in order to obtain one gallon of sirup.

Vermont and New York are the leading producing states, the next in order being Ohio, Michigan, Pennsylvania, Wisconsin, New Hampshire, Massachusetts, Maine, and Maryland. According to the United States Department of Agriculture, the number of maple trees tapped in these ten states in 1950 was approximately 7,711,000 compared with about 9,957,000 in 1940; there were about 262,000 pounds of sugar made in 1950 compared with about 434,000 pounds in 1940; and approximately 1,968,000 gallons of sirup were produced in 1950 with about 2,597,000 gallons produced ten years previously. This general decline in production has continued over many years and is vividly illustrated by the fact that the annual output of maple sugar and of maple sirup expressed in terms of sugar was on an average of 43,155,000 pounds in the period 1917 to 1920, but had fallen to an average of 14,404,000 pounds in the period 1947 to 1950.

In Canada maple sugar and maple sirup are produced chiefly in Quebec, which is the recognized center of the industry, and in Ontario, New Brunswick, and Nova Scotia. The total Canadian production in 1948 was 2,350,000 pounds of sugar and 2,159,000 gallons of sirup. Of this aggregate Quebec is credited with 2,187,000 pounds of sugar and 1,750,000 gallons of sirup.

History.—Maple sugar and sirup were made by the early pioneers of New England and Canada. The art was a product of "necessity, the mother of invention," or an inheritance from the Indians, who were familiar with the process of making the sugar. But, in either event, the first methods employed were crude, and the article was dark in color and not attractive. Moreover, tapping trees with an axe tended to denude the forest of its maples, and the entire procedure was wasteful in the extreme. The sap was caught in troughs, hewed out of logs, thence carried in pails to the boiling place and reduced to sirup in potash kettles which were suspended by chains from a horizontal pole, supported by forked or crossed sticks at each end and surrounded by a blazing open fire. Improved methods, however, both as to tapping the maples and refining the sap, gradually followed one another, until now modern scientific methods prevail, and it is possible to reduce the sap to sugar or sirup almost immediately by using evaporators.

Adulteration.—Prior to the passage of the National Pure Food and Drugs Act, and before the federal government inaugurated its crusade against misbranding, certain sugar refineries made much more sugar and sirup, labeling it "maple," than the entire natural production. This practice, however, has been suppressed, and, though much maple sirup is sold to concerns which blend it with cane sirup, no attempt is made in marketing the product to deceive the public, the labels simply stating that the article within the container is a sirup made by blending cane and maple sirups.

MAPLEWOOD, city, Missouri, is located at an altitude of 508 feet directly to the southwest of St. Louis of which it is a residential suburb. It is served by the Missouri Pacific Railroad. Settled in about 1865 and incorporated in 1908, Maplewood has a commission type of government. Pop. (1950) 13,416.

MAPLEWOOD, township in Essex County, New Jersey, is situated six miles west of Newark on the Delaware, Lackawanna and Western Railroad. Although largely a residential suburb of Newark and New York City, celluloid, metal products, and golf clubs are manufactured here. Of historic interest in Maplewood, which was incorporated in 1922, is the Timothy Ball House often visited by Washington during the Revolutionary War. Pop. (1950) 25,201.

MAPPA, măp'pă, **Adam Gerard,** Holland-American soldier and type founder: b. Delft, Holland, Nov. 25, 1754; d. Olden Barneveld, N. Y., April 15, 1828. As a young man he entered the military service of his native country, gaining marked distinction. He later engaged in the type-founding business, but his work was interrupted by the political storms which disturbed the Netherlands in 1786–1787. Colonel Mappa again took up the sword and became a leader of volunteer militia forces which aimed at liberalizing Dutch political institutions, but in the abortive revolution of 1787 his forces were overwhelmed and he was banished forever from Delft.

Mappa then went to the court of Versailles to solicit cooperation. Louis XVI, however, had troubles enough of his own, and, as the prospects of civil liberty being established in his own country grew fainter, Colonel Mappa decided to move with his family to America.

While in Paris, Mappa became acquainted with Thomas Jefferson, then American ambassador to France, who advised him to take to America a type-founding plant. Up to this time all printers had been obliged to purchase their type in Europe since there was as yet no type foundry on the western side of the Atlantic. Accordingly, when Mappa arrived in New York in 1789, he brought with him a complete letter foundry.

The infant industry, nevertheless, did not prosper, and in 1794 he advertised his type foundry for sale. Later that same year he moved to Olden Barneveld, later Trenton, now Barneveld, where, as resident agent for the Holland Land Company, he played an important role for more than thirty years in helping to settle that part of New York State.

MAPU, mä'pōō, **Abraham,** Hebrew novelist: b. Slobodka, a suburb of Kovno, Lithuania, Jan. 10, 1808; d. Königsberg, Oct. 9, 1867. Noted as a Talmudist when still very young, Mapu also became well acquainted with French and Latin secular literature, both of which exerted a lasting influence on his literary endeavors. In 1848 he was appointed professor in a Jewish school at Kovno, and in 1853 his historical novel *Ahabat Ziyyon* (*The Love of Zion*) appeared. This important work, which managed effectively to symbolize the spirit of regeneration of the Jews through contact with Palestine, was a significant forerunner of the romantic movement in 19th century Hebrew literature. An English translation, *Amnon, Prince and Peasant,* written by Frank Jaffe was published in 1887. His second major historical novel, *Ashmat Shomeron* (*The Transgression of Samaria*), was published in 1865. He also wrote *Ayit Zabua* (*The Hypocrite*) (1857–1861), a Hebrew manual, and a Hebrew grammar.

MAR is the section of Scotland located between the Dee and the Don rivers. The ancient earldom of Mar, which had previously expired, was restored by being granted in 1565 to John, 6th lord of Erskine, who had been regent of Scotland. His son, the 2d earl of Mar and guardian of James VI, helped to negotiate the question of the succession of James to the English throne. The 6th earl, after helping to negotiate for the union of Scotland and England, returned to Scotland and led an unsuccessful rebellion in 1715 for the Old Pretender.

MAQUI, mä'kē, an evergreen shrub of the family Elaeocarpaceae, found in Chile, from the juice of whose acid berry the Chileans make a wine given to persons ill with fever. It is the best-known species of the genus *Aristotelia* (*A. maqui* or *macqui*) and is sometimes cultivated as an ornamental shrub.

MAQUIS, mä-kē', a dense copselike growth found in the hot, dry regions of thin soil along the coasts of the Mediterranean Sea. It usually consists of a thicket of such bushes as the arbutus, cistus, holm oak, myrtle, tree heath, wild olive, or laurel. In Italy the growth is called the *macchia,* and in California it is called the chaparral, in the latter case generally consisting of dwarf evergreen oak. The name, by extension, also applied to Corsican bandits who, in evading the law, would hide in the maquis growth.

During World War II, when Pierre Laval instituted a compulsory labor draft in Vichy France in 1943, the term began to be applied to those who fled to the countryside to escape this draft and later to all who were participating in underground resistance. Such groups of men, the *maquisards,* concentrated particularly in the mountainous regions of France bordering on Italy and Switzerland. They were organized only on a local basis until 1944 when nation-wide contact was established and they became a part of the French Forces of the Interior (FFI).

MAQUOKETA, mȧ-kō'kĕ-tȧ, city, Iowa, seat of Jackson County, is located at an altitude of 685 feet on the Maquoketa River 30 miles south of Dubuque. Served by the Milwaukee Railroad, it is chiefly an agricultural trading center although the manufacturing of foundry and machine-shop products and fishing tackle is also carried on. Valuable limestone quarries are in the vicinity, and not far distant are forests which furnish excellent hardwood timber. The city owns and operates the waterworks and the electric generating plant and distribution system. Pop. (1950) 4,307.

MARA, mä'rȧ, in Norse legend, was a goblin that seized on men asleep in their beds and took from them all speech and motion. In Buddhist mythology Mara is the tempter, the ruling spirit of evil. Mara is also frequently identified with the incubus and with nightmares.

MARABOU, măr'ȧ-bōō, a large African pink-white pouched stork (*Leptoptilus crumenifer*), which resembles the adjutant (q.v.) of India in appearance and habits. It gives its name to the soft and drooping feathers (coverts) which cover the root of the tail and are prized for millinery and other ornamental purposes. A large part of the "marabou feathers" sold, however, are derived from the Indian adjutant.

MARABOUTS, măr'a-boots, **MARABOOTS,** or **MARABUTS,** Mohammedan Arab hermits or devotees, leading a secluded religious life or occupying a religious station in northern Africa. They have great influence among the Berbers and distribute amulets, affect to work miracles and are thought by their followers to exercise the gift of prophecy. Throughout the Barbary States the tombs of the Marabouts are conspicuous objects, being generally built in the open country and regarded by the people with much reverence. Some of them have degenerated into religious tramps.

MARACAIBO, mä-rä-kī'bō, Venezuela, capital of the state of Zulia, situated on the strait that connects Lake Maracaibo with the Gulf of Venezuela. It has a large and safe harbor, and maintains commercial relations with foreign markets, with the interior and with Colombia. Hundreds of small craft, suitable for shallow waters, carry on the trade of the coast and rivers tributary to the lake. The most important buildings are the Executive Mansion, the public market, Legislative Palace, municipal building, Baralt Theatre, university, churches and the prison. The public plazas contain statues of the patriot, Gen. Rafael Urdaneta, and Don Rafael Baralt, author of a history of Venezuela, who was born in Maracaibo and became a member of the Royal Spanish Academy. There is a dockyard for the construction of sailing-vessels and the city has electric lighting, telegraph and telephone service, submarine cable, street railways, etc. In the last few years rich deposits of petroleum have been found along the shores of Lake Maracaibo, which has resulted in increased activity in the city, and made Maracaibo one of the most important petroleum export centres of Latin America. Petroleum, coffee, cocoa and hides are the chief exports, which have an average annual value of $2,300,000. Maracaibo, at first called Nueva Zamora, was founded in 1571 by Alonzo de Pacheco. This city is the starting point for passenger and freight steamers and rail lines. Pop. about 110,000.

MARACAIBO, Gulf of. See VENEZUELA, GULF OF.

MARACAIBO, Lake of, Venezuela, in the northwestern part, connected with the Gulf of Venezuela by a strait about 50 miles long and from 8 to 15 miles wide. The lake lies between 9° and 11° N. lat. and 71° and 72° W. long., and is about 100 miles long from north to south and 80 miles across the widest part. At the mouth it is about 500 feet deep, but at its head it is shallow and the land near the shore is marshy. Large vessels cannot enter because of a bar at its mouth which leaves only from 8 to 13 feet of water. A number of rivers flow into the lake and keep it fresh, but when strong north winds prevail it becomes brackish. The tides do not affect the lake to any very great extent although it is a marine inlet. It was once much larger than at present, as the shore-marks indicate, but the basin has been filled in. Petroleum deposits have been discovered along its shores and are being extensively developed. See VENEZUELA.

MARAJO, mä-rä-zhō' (called also Joannes), Brazil, an island at or between the deltas that form the mouths of the Amazon and Para rivers; area, about 14,000 square miles. From east to west the greatest dimension is 162 miles and 110 miles north and south. The greater part is low; in the centre are several lakes. In the north and west are swamp lands and in the east and south forests, the rubber tree predominating. The chief settlement is Saure on the eastern coast. There are not many residents, as in the rainy season nearly the whole island is flooded. Cattle raising and gathering rubber are the chief occupations.

MARAL, the red deer of Persia.

MARANHAM, mä-rän-yäñ, or **MARANHÃO,** Brazil, a maritime state, just south of the Equator, bounded on the north by the Atlantic Ocean; area, 177,515 square miles. The surface is uneven, but there is no range of mountains. There are numerous rivers flowing into the Atlantic, large forests, extensive plains where cattle are reared; the climate is fine and the soil fertile. The Paranhyba is the principal river, being 700 miles long, with several large tributaries. The Gurupy, the Mearim and the Itapicurú are each about 500 miles in length. Agriculture has only begun; the emancipation of the slaves, on whose labor the state had depended, was followed by a period of great depression. Cotton, sugar and rubber are the principal products. Coffee, rice, corn, cacao and tropical fruits grow luxuriantly. The population is not great enough to properly develop the rich natural resources, there being only 4.9 persons to the square mile. Efforts are being made to colonize different sections, but the hot climate is not attractive. The present inhabitants are chiefly of Portuguese descent; but there are about 20,000 Indians and a few hundred negroes and mulattoes. The capital is Maranham. Pop. about 1,200,000.

MARANHAM, or **SÃO LUIZ DE MARANHÃO,** sän loo-ēzh' dō mä-rän-yän', Brazil, capital of the state of Maranham, on an island on the bay of São Marcos and between the mouths of the Itapicurú and Mearim rivers. The first settlements were made by the French in 1612. The ground is low and the climate warm but the place is healthful. The harbor, once good, is filling with sand, and little or nothing is done for its improvement. It has considerable trade, the imports and exports totaling $600,000 annually. The chief exports are cotton, sugar, hides, rubber, cotton-seed and the skins of goats. Wool is woven and rugs and felt manufactured. The chief imports are machinery and clothing. The city has many fine buildings, public and private. Pop. including the suburbs, about 60,000.

MARANHÃO. See MARANHAM.

MARASCHINO, măr-ăs-kē'nō, or **MARASQUINO,** a fine liqueur prepared from the sour cherry of southern Europe (*Prunus mahaleb*). The best-known kinds come from Dalmatia and from Corsica. There are other brands that use the name.

MARASMUS, a vague term denoting general emaciation or atrophy with no special cause apparent; now used in relation to the wasting of infants due to malnutrition combined with unhygienic surroundings. See CHILDREN, DISEASES OF.

MARAT, Jean Paul, zhŏñ pōl mä-rä, French revolutionist: b. Boudry, Neuchâtel, Switzerland, 24 may 1744; d. Paris, 13 July 1793. He

studied medicine in Paris, traveled widely and practised in London and later in Paris. The first breath of the Revolution converted the industrious doctor into an audacious fanatic and demagogue. He succeeded, by his violence and energy, in commanding attention. Danton instituted the club of the Cordeliers and collected around him all the fiercest spirits; among the number, Marat, who became the editor of the *Publiciste Parisien,* better known under its later title *L'Ami du Peuple,* again changed to the *Journal de la Republique Française.* This sheet was the oracle of the mob. Denounced to the Constitutional Assembly and proceeded against by the municipal authorities of Paris, he contrived to escape to London and was later in hiding in Paris. During the existence of the Legislative Assembly he continued his outrages, figured among the actors of 10 August and in the assassination of September (1792). He was a member of the Committee of Public Safety to the convention and made the Ministers, General Dumouriez and the Girondists, the objects of his attack. Being charged in the convention with demanding in his journal 270,000 heads, he openly boasted of that demand and declared that he should call for many more if those were not yielded to him. The establishment of the revolutionary tribunal and of the committee for arresting the suspected was adopted on his motions. On the approach of 31 May, as president of the Jacobin Club, he signed an address instigating the people to an insurrection and to massacre all traitors. Even the Mountain party denounced this measure and Marat was delivered over to the revolutionary tribunal, which acquitted him; the people received him in triumph, covered him with civic wreaths and conducted him to the hall of the convention. His bloody career was closed by assassination. (See CORDAY D'ARMANS, CHARLOTTE). His remains were placed in the Pantheon, whence they were later removed. Consult Chevremont, 'Jean Paul Marat' (1881); Bat, 'Jean Paul Marat, the People's Friend' (1901); Velay, C., 'Correspondance de Marat' (Paris 1908).

MARATHI. See MAHRATTAS.

MARATHI LANGUAGE AND LITERATURE. Marathi is one of the principal vernaculars spoken in India. It bears a close affinity to Sindhi and Gujerati and is spoken by about 20,000,000 people. There are several dialects of it, named, respectively, Konkani and Dakhani. The latter is the standard dialect and circulates in the Deccan, the former in the coast region of the Mahrattas and shows a large admixture of Dravidian, while in the district around Goa (a Portuguese possession) it also contains many Portuguese expressions and phrases. Besides, Marathi as a whole has a rather strong infusion of both Arabic and Persian words. All the same, modern Marathi has departed less from the original Sanskrit than most other Prakrits, being a direct descendant from the Maharastri of the Middle Ages. A stock of its vocables are taken from Sanskrit itself, the so-called *tatsamas.* There are three genders in Marathi, the only one of the Prakrits that has retained this feature of Sanskrit. Konkani literature was destroyed by the Portuguese inquisition.

Marathi literature is abundant. It took its inception with Namdev in the 13th century, who wrote descriptive and didactic poems of a religious cast. Tukaram, the most famous of Marathi writers (A.D. 1609), published writings showing Vishnuic convictions. Mayur Pandit in the 18th century also wrote many poems, epic, lyrical and descriptive. Marathi lends itself most readily to rhyme, and there are current among the Marathi people many rhymed proverbs, both pithy and fanciful. In prose not much of consequence has been produced.

WOLF VON SCHIERBRAND.

MARATHON, măr'a-thŏn, Greece, an ancient village in Attica, about 20 miles northeast of Athens. It was situated on a plain which extends for about six miles along the sea shore, with a breadth of from one and a half to three miles. The site of the ancient village was not probably that of the present Marathona, but at a place now called Vrana, a little farther south. Through the centre of the plain runs a small brook. Here was fought the great battle between the Athenians and Persians, 490 B.C. (See MILTIADES). A tumulus or «soros» on the plain marks the burial-place of the Athenians who died in battle. It was excavated by the Greek Archæological Society in 1890–91, and yielded many interesting relics.

MARATHON RACE, an athletic contest commemorating the feat of Pheidippides, Greek Olympic runner, who in 490 B.C., ran from Marathon to Athens to carry news of the defeat of the Persians by Athenians and Spartans and fell dead as he cried: «Rejoice, we conquer.» The distance run was 22 miles. The modern race, feature of Olympic games since 1896, is for a distance of 26 miles, 385 yards. For modern records see OLYMPIC GAMES; SPORTS, THEIR DEVELOPMENT, SPEEDS AND RECORDS.

MARATTI, mä-rät'tē, **or MARATTA,** mä-rät'tä, **Carlo,** Italian painter and engraver: b. Camerino, 13 May 1625; d. Rome, 15 Dec. 1713. While a child he amused himself with painting all sorts of figures drawn by himself on the walls of his father's house. In his 11th year he went to Rome, studied the works of Raphael, of the Caracci and of Guido Reni in the school of Sacchi, and formed himself on their manner. His Madonnas were particularly admired. Louis XIV employed him to paint his celebrated picture of Daphne. Clement IX, whose portrait he painted, appointed him overseer of the Vatican Gallery. We are much indebted to him for the preservation of the works of Raphael in the Vatican and of the Caracci in the Farnese Palace. He also erected monuments to those masters in the church Della Rotonda. As an artist Maratti deserves the title given him by Richardson, of the «Last Painter of the Roman School.»

MARATTIALES. See FERNS AND FERN-ALLIES.

MARAVEDI, măr-a-vā'di, the lowest denomination of old Spanish copper coins in use

from 1474 to 1848, varying in value from one-seventh to one-third of a cent. There were also, at an earlier period, maravedis of gold weighing 60 grains.

MARBEAU, Jean Baptiste Firmin, zhŏń bä-tēst fēr-măń mär-bō, French philanthropist, founder of the day nursery: b. Brives, 18 May 1798; d. Saint Cloud, 10 Oct. 1875. He practised law in Paris, and in 1841, being deputed to inspect the charitable institutions of the first arrondissement of the city, planned the crèche or day nursery for the care of children of working mothers. The first crèche was opened 14 Nov. 1844 at Chaillot; a Société des Crèches was founded in 1846; and his plan was described in his book, 'Des Crèches' (1845). Marbeau played a less prominent part in other charities and wrote on various problems of pauperism. Consult the 'Life' by Roussel (1876).

MARBLE, mär'bl, **Manton,** American journalist: b. Worcester, Mass., 16 Nov. 1834; d. Maidstone, England, 24 July 1917. He was educated at the Albany Academy and the University of Rochester, being graduated from the latter in 1855. After spending seven years in the employ of Boston and New York newspapers he bought the New York *World,* on the staff of which he had been employed from 1858 to 1860. Marble was engaged in a controversy with President Lincoln concerning the publication of certain dispatches in the *World.* The latter journal was temporarily suspended from publication. Marble was one of the first to recognize and give publicity to the writings of Herbert Spencer. In 1885 President Cleveland sent Marble to the British, French and German governments as special envoy to discuss the subject of international bimetallism. On his return, after conferences with various European authorities, he advised the President that upon the co-operation of the United Kingdom, for which neither Tory nor Liberal leaders were prepared, depended the German and French resumption of free bimetallic coinage, and advised that United States purchase of silver should cease. Marble was one of the founders of the Manhattan Club and at one time the president of that organization. He belonged also to many literary and scientific societies, among them the Century Association, the Round Table, the Cobden Club and Metropolitan Club. He was the author of 'Letter to Abraham Lincoln,' 'The Presidential Counts,' 'A Secret Chapter of Political History' and a memoir of Alex. G. Mercer, which prefaced his 'Notes of an Outlook on Life.'

MARBLE (from the Greek *marmairein,* to sparkle), a compact rock which, in its pure form, is composed entirely of carbonate of lime or limestone. In its best form it is a variety of calcite, the tiny crystal facets sparkling and flashing in the sun's rays; hence its ancient name. It is seldom found in perfect purity, the tractable qualities of the limestone allowing the introduction of many foreign substances during its formation. Thus there will be seen marble with streaks of various colors running through it, caused by the action of oxide of iron or other chemicals. Almost any limestone rock is commonly called marble, even certain varieties of granite, onyx, porphyry and rock largely composed of gneiss and mica-schist. True marble is a metamorphic equivalent of limestone, from which it has been produced by heat or pressure, or both.

Marble has been a favorite stone for forming into statuary and for decorative work in buildings and monuments, from the very earliest ages. The Greeks, who were the first to endow this lifeless stone with marvelous genius in their statuary and bas-reliefs, were blessed with an almost inexhaustible supply of the very finest and purest marble yet discovered, on the island of Paros, in the Ægean Sea. This marble, so celebrated as "Parian," possesses a peculiar waxy attribute which gave the statues formed from it a beautiful polish. The 'Venus de Medici' was made from this stone, which is almost perfectly white. The Parthenon was built of marble of Pentelicus, which was a little more finely grained. The marbles of Carrara were even then known but not generally put in use till later years, being still among the finest marble in the world, though having some gray streaks.

In many other parts of Continental Europe and in Great Britain are quarries of fairly pure marble. America has a large supply of this useful stone. Each year new occurrences of it are found in the Rocky Mountains, some of them pure white, others with variegated colorings. Perhaps the finest example of these wonderful marbles of the Rockies is found in the new State capitol building of Colorado, at Denver. In the eastern part of the United States there are many quarries of marble which have been in use for many years. Vermont is probably the seat of the largest quarries. Little of this marble is finely grained and white enough to answer for the sculptor's use, but it is admirably adapted for ornamental purposes in architecture and for monuments for the dead. American sculptors still generally use the marbles from Carrara, though the merits of the American product are becoming known. Vermont, although one of the smallest States in the Union, exports more stone for commercial purposes than any other State, except one, Pennsylvania standing first. The money value of Vermont's stone product is approximately $10,000,000 a year, a large part of it being in marbles of various grades.

The quarrying of marble is now carried on extensively, the use of machinery largely taking the place of the ancient hand methods. Fifty years ago the quarries of Rutland, Vt., still the largest in the world, were operated by ox teams and hand work of the crudest form. To-day, these vast quarries have an extensive outfit of electric cranes and derricks, which move the blocks of marble in any desired direction, easily and quickly, one of these traveling cranes having a carrying capacity for 100,000 pounds. The stone is too easily broken to permit the use of blasting powders of any kind. This method is used in some of the Italian quarries, but causes great waste of material and is most unsatisfactory. In the Vermont quarries, a machine called a "channeler" has been found the best for economical work and has been exclusively adopted. It consists of a row of long chisels set in a strong, traveling framework. This gang of chisels vibrate up and down, cutting a channel in any direction desired in the face of the marble ledge. The channel can be made any reasonable depth, according to the size of block desired. When this channel, or groove, is suf-

ficiently long and deep, the machine is reversed and cross channels are cut and the bottom perforated. Then wedges are carefully driven in behind the block of stone and it gently falls over, to be lifted by a crane to the railroad cars or to that part of the quarry devoted to further treatment of the output. As a rule, the stone is sent in its rough state to the purchaser, who dresses it himself. When the order is for monument work or some special design in architecture, the marble is treated at or near the quarry. In thus further treating the product, a toothless saw, or gang of saws, is used. The block of stone is placed on a horse, or platform, and the saws set at work, the size of the cut being gaged by setting the saws close together, or far apart, as needed. A stream of water in which is mixed sea sand or other sharp, hard sand falls upon each saw. The friction of the iron blade, aided by the sand and water, quickly cuts up the marble into any desired shape.

Some marble cutters use saws of wire, but the best seem to be those made of strips of soft iron one sixteenth of an inch thick and, when new, four inches wide. The marble wears down one of the saw blades very rapidly. When the blocks are thus sawn into the requisite shapes by the power gang saws, they are then placed on tables and ground down to size, a small piece of marble being rotated over them by hand or power, water flowing over the surface being ground. With surprising facility, the marble yields to this treatment. Polish, in the final stages, is given by rubbing with wood or other soft material, and finally cloth. Much hand work is, of course, necessary with the mallet and chisel and polisher, but all the rough, heavy work, which formerly made marble so costly and hard to obtain, is now done entirely by electric and steam power. One of the finishing rooms at the Rutland works, located at Proctor, Vt., is 1,000 feet long and contains scores of giant gang saws, cutting up the marble into various shapes. This plant, one of the largest in the world, has an output of $3,000,000 annually and employs hundreds of men. Most of this output is of white marble, though brown, gray, green and other shades are found in profusion.

One ancient method of mining this delicate stone, still used entirely by the Mexicans in mining onyx, is to drill holes in a line, insert plugs of some porous wood, pour in water and allow the wood to swell. This gently forces the precious stone free, without the least injury.

One quality of marble, not usually recalled, is its ability to withstand great heat safely. In the devastating fire in 1903 at Paterson, N. J., buildings built of granite crumbled and perished. Those of marble still stand, almost as good as ever. Its use is, therefore, becoming more and more general in erecting fireproof buildings in the large cities, the floors and often the entire inside wall and ceiling being overlaid with it.

Some really fine examples of craftsmanship in this line are found in the public buildings of New York City and elsewhere in America, notably the buildings of the Hall of Records and the Appellate Division of the Supreme Court, in New York. In the making of monuments for the dead, marble is most extensively used. The floors of bathrooms, tops of toilet tables, basins for washing hands and clothes, tiling of various sorts—all these and a thousand other household purposes find in marble their chief exponent. Probably more than $75,000,000 worth of finished marble products are used in the United States annually, made from domestic quarries entirely. See also Rocks.

MARBLE FAUN, The. *The Marble Faun* was begun by Nathaniel Hawthorne during his visit to Italy in 1858 and was published in 1860. In England it was issued as the *Transformation.* The scene is laid in Rome, but two of the four chief characters are Americans. The most interesting person in the story, however, is Donatello, a young Italian of noble birth who bears a strong resemblance to the statue of a faun by Praxiteles, and who, according to a tradition in his family, numbered a faun among his early progenitors. There are two women characters, of different types. Miriam is of a rich, full-blooded nature, and her past is bound up with some terrible mystery. Hilda, who is said to have been drawn with the writer's daughter in mind, was evidently intended as an example of the pure and self-contained New England maiden, but she has been aptly characterized by one critic as an "admirable little icicle." The romance is a study of the effects of a great guilt on these persons, and especially on Donatello, in whom it brings about the change referred to in the English title of the book.

Hawthorne here seems to be considering the great question of the mission of sin in the world, but in the end the explanation which he allows one of the characters to suggest he makes Hilda reject with horror.

The romance has serious technical defects. It contains an excess of traveler's descriptions, which, however excellent in themselves, have little to do with the story; and it fails to satisfy the curiosity which the author persistently arouses regarding Miriam's past. Dissatisfaction with the ending was so great that in a later edition the author added a chapter of explanation, which, however, he justly regarded as no improvement. The chief merits of the book lie in the conception of Donatello, in the elusive symbolism and suggestiveness which characterize all Hawthorne's best work, and in several impressive scenes. Some of these, like the meeting with the model in the catacombs and the visit to the church of the Capuchins where the murdered monk lies, have a more dramatic quality than is usual with Hawthorne.

MARBLED TIGER CAT. See Tiger-cat.

MARBLEHEAD, mär'b'l-hĕd, town, Massachusetts, Essex County, is located on Massachusetts Bay, 17 miles northeast of Boston; on the Boston and Maine Railroad. The town is located on a double peninsula, with Point Light on the southeastern projection, the "Neck." There are yacht piers and a public landing. Fishing and boatbuilding are carried on, and Marblehead is one of the Atlantic coast's best known yachting centers; it also has many fine summer homes. In the middle decades of the 19th century the town was an industrial community, making shoes, glue, rope, barrels, and paint. Marblehead has many old houses of historic interest. Abbot Hall contains the town administrative offices and the public library. In it is preserved

the original of the famous painting by Archibald M. Willard (q.v.), *The Spirit of '76*. The local art association has quarters in the King Hooper mansion, and the historical society maintains a museum in the Jeremiah Lee mansion (1768). Settled in 1629 by fishermen from Guernsey and Jersey (compare John Greenleaf Whittier's poem, *Skipper Ireson's Ride*), the town was until 1649 a part of Salem. It was the birthplace of Elbridge Gerry (q.v.). In the Revolutionary War Marblehead privateers, the *Hannah* and the *Lee*, rendered noteworthy service. Pop. (1950) 13,765.

MARBLES AND MARBLE PLAYING. Marbles are small balls of baked clay, marble, agate or spheres of glass, used as toys and playthings for children. They were manufactured in large quantities in Saxony for exportation to the United States and to India and China. They were also largely manufactured in the agate mills at Oberstein on the Nahe, in Germany, for the American market. The material used in Saxony was a hard calcareous stone, which was first broken up into square blocks with a hammer. These were then thrown 100 to 150 together into a mill, which was a stationary flat slab of stone, with a number of concentric furrows upon its face. Over this a block of oak of the same diameter, partially resting upon the small stones, was kept rotating, while water flowed upon the stone slab. In 15 minutes the marbles were worn completely round and were fit for sale. An establishment with three mills would manufacture 60,000 marbles in a week. Agates were made into marbles at Oberstein by first chipping the pieces nearly round with a hammer and then wearing them down upon the face of large grindstones.

The game of marbles is variously played; usually with a circular ring marked on the ground, the player taking one marble between the thumb and forefinger and dexterously shooting at other marbles within the circle, striking them with sufficient force to throw them outside the limits of the ring. This form is called ring-taw, and the marbles placed in the ring are apt to be clay ones, called "commys," which is probably short for "commons." A larger and better grade of marble is used for the "shooter." When a player misses a shot, it is then the turn of his opponent. Sometimes he also loses his turn when he drives his shooter outside of the ring. Play is often for "keeps," each boy winning what he knocks out. Another game of marbles is called "nine holes," though it may be played with a less number of holes. A row of small cup-shaped depressions is made in the ground, and the object is to toss or bowl one's marble into each hole in succession, the one accomplishing it with the fewest plays winning. Very likely golf had its fundamental idea in this simple game of marbles. In a variant form the boys shoot at other marbles to knock them into the holes, but their own shooter must not follow, under forfeit, suggesting the basic principle of the game of pool. "Hit and span" is another game much played. One player tosses his marble to a distance, and the other player tosses his marble as close to it as he can; if he hits it, it is for keeps; if he comes within a handsbreadth or span he makes a hit and scores one. Then they reverse, and his opponent tries, the one making the most hits or points winning. This game can be played in walking along a country road, and appears to have been invented by boys who wanted to play on their way to school. In some games of marbles it is fair to toss or bowl the shooter; and in others the player must touch the large knuckle of his forefinger to the ground when shooting, and this the boys call "knuckling down fairly." These games are subject to infinite change, according to the whim of the players, usually boys, of a locality who play them. They make their own rules and pass them along to the smaller players as they grow up. In the United States a National Marbles Tournament is held annually at Wildwood-by-the-Sea, N. J.

MARBLING, *in bookbinding,* the process of coloring paper or the edges of books, in imitation of the veining of variegated marble. In the case of a book, after the volume is formed, but before the cover is put on, the book leaves are trimmed and tied between two boards and taken to a trough or vessel, perhaps two inches deep, which is filled with clean gum water. Various colored pigments, ground in spirits of wine and mixed with a small quantity of oxgall, are thrown upon the surface of the gum water, and disposed in various forms with a quill and comb, forming a variegated, marble-like pattern. When satisfied with the coloring mixture, the workman dips the edges of the book into the trough, and the colors adhere. Cold water is then dashed over the edges, to set the colors and bring them out clearly. Sometimes single leaves are marbled and placed just within the book cover, front and back, for ornamentation. Marbling was formerly quite common, but is now seldom used, solid colors, as red edges, being preferred, or gold edges. The deckle-edged book cannot be marbled, owing to its rough edges. See also BOOKBINDING.

MARBURG, mär'bûrg, or **MARIBOR,** mä'rē-bôr, city, Yugoslavia, in the federated republic of Slovenia, capital of Maribor oblast formed in 1949, is located 55 miles north of Zagreb, on the Drava River, and on the Zagreb-Vienna Railroad. It has railroad repair shops, textile mills, and factories making automobiles, leather goods, shoes, chemicals, and asbestos products. Pop. (1950) 66,498.

MARBURG, mär'bo͝orĸ (Eng. mär'bûrg), also **Marburg an der Lahn,** city, Prussia, Germany, is located on the Lahn River, 46 miles north of Frankfort. It dates from the 12th century. The principal buildings are the castles of the landgraves of Hesse; the 13th century church of Saint Elizabeth; the town house and the celebrated Marburg University, founded in 1527. Here Martin Luther and Ulrich Zwingli debated on transubstantiation in 1529. It became a part of a Prussian province in 1866. It was captured by United States troops in the spring of 1945, during World War II. The town has manufactures of machinery, chemicals, precision instruments, and pottery. Pop. (1950) 39,256.

MARBURY v. MADISON, a well-known decision in law handed down in 1803 by the United States Supreme Court. It is important as affording the earliest instance of the declaration by the court that a Congressional statute is null and void by reason of its repugnance to the Constitution of the United States. Marbury was

appointed justice of the peace in the District of Columbia by President Adams, but the commission, though drawn up, signed and sealed, had never been delivered. Madison, when he became secretary of state, refused to deliver it. An act of Congress empowered the United States Supreme Court to issue to executive officers a writ of mandamus to force them to attend to their duties, and on the basis of this act Marbury brought suit. Now the Constitution nowhere mentions the right to issue a writ of mandamus among the cases of original jurisdiction by the Supreme Court. Chief Justice Marshall therefore decided against Marbury, and his argument, admittedly the only accurate one, established an important precedent which is found only in the courts of the United States.

MARCABRU, mär-kȧ-brü′, a French troubadour: b. in Gascony, about 1140; d. toward the end of the 12th century. He was a special favorite at the court of Alfonso VIII of Castile, where he seems to have been the chief of the royal troubadours.

MARCASITE, mär′kȧ-sīt, *in mineralogy,* an iron disulphide (FeS_2), differing from pyrites in that it crystallizes in the orthorhombic system. It is usually a pale yellow, being thus lighter than true pyrites, but it has gray to brown-black streaks.

MARCEL, mȧr-sĕl, **Étienne,** French political leader: d. Paris, July 31, 1358. From December 1354 he was provost of the Paris merchants and actual ruler of the city. He put to death two officials of the Crown and finally persuaded the dauphin Charles (later King Charles V of France) to act as regent while King John the Good was held by the English. Not finding the Dauphin properly submissive, he obtained assistance from Charles the Bad of Navarre. He was killed during an uprising of the more wealthy and conservative citizens against his power.

MARCELINE, mär-sĕ-lēn′, city, Missouri, in Linn County; altitude 858 feet; 104 miles northeast of Kansas City; on the Santa Fe Railroad. Railroading and mining have been its principal industries, but farming and food processing are advancing here. Walt Disney spent his boyhood years in Marceline. The city owns light and water supply systems. Pop. (1950) 3,172.

MARCELLINUS, mär-sĕ-lī′nŭs, Saint and pope: reigned 296–304. The Diocletian persecution raged during his reign, and he has been accused by the Donatists (q.v.) of relinquishing the sacred books and of offering incense to the gods. This is questioned by Augustine as Marcellinus died a martyr.

MARCELLUS I, mär-sĕl′ŭs, Saint and pope: reigned 308–309. After an interregnum of two years he was elected pope and found the church in great confusion after the Diocletian persecution. He restored some semblance of order by dividing Rome into 25 districts supervised by a presbyter with certain authority. He incurred the enmity of the *lapsi* for refusal to readmit them to the church without doing penance for their apostasy. The tyrant, Maxentius, seized the pope and banished him. He died in exile.

MARCELLUS II (real name MARCELLO CERVINI DEGLI SPANNOCHI), pope: reigned 1555. Of great purity of life and marked ability, Paul III appointed him prothonotary apostolic and papal secretary. He was made advisor and secretary to the pope's able nephew, Cardinal Alessandro Farnese (q.v.), and accompanied him on his various legations to the courts of Europe, participating in important negotiations. Appointed president of the Council of Trent (1545 q.v.) he incurred the enmity of the emperor, Charles V, for fearlessly upholding the interests of the church. As librarian of the Vatican (q.v.) he added priceless manuscripts to its collections. Elected pope, he set about the immediate reform within the church, but was stricken ill and died after a pontificate of 22 days. Palestrina (q.v.) dedicated his famous *Missa Papae Marcelli* to him.

MARCELLUS, Marcus Claudius, Roman general: b. 268 B.C.?; d. near Venusia, 208 B.C. In 222 being consul with Scipio he twice defeated the Insubrians in northern Italy, and with his own hand killed their king, thus winning the *spolia opima.* After the disaster of Cannae in the Second Punic War (216), Marcellus took command, gained several slight victories over the Carthaginians and hence was named "the sword of Rome," Fabius Cunctator being called "the shield of Rome." His third consulship (214) was spent in Sicily, where he attacked Syracuse, and after a two years' siege prolonged by the skill of Archimedes captured the city. In his fifth consulate after two years of varying success against Hannibal in Italy he was killed in a skirmish near Venusia.

MARCELLUS STAGE, *in geology,* a term introduced by the New York State Geological Survey for the thin rock, mostly shale, which is the lowest group of the Upper Devonian System, and which is most typically seen in New York State at the little village of Marcellus.

MARCH, märch, **Alden,** American surgeon: b. Sutton, Mass., Sept. 20, 1795; d. June 17, 1869. He was educated at Boston and at Brown University, receiving the degree of M.D. from the latter in 1820. From 1825 to 1831 he was a professor in the Vermont Academy of Medicine, from 1831 to 1833 at the Albany Medical Seminary, and in 1833–1834 at the Albany Medical School. In the latter year he founded a school of practical anatomy in Albany and in 1839 founded the Albany Medical College, in which he was professor of surgery from the foundation until his death in 1869. Dr. March also founded the Albany City Hospital, and founded the American Medical Association, of which he was president in 1863.

MARCH, Francis Andrew, American philologist: b. Millbury, Mass., Oct. 25, 1825; d. Sept. 9, 1911. He was graduated from Amherst in 1845, studied law in New York in 1849–1850, was admitted to the bar in 1850, in 1856 became adjunct professor of *belles-lettres* and English literature in Lafayette College (Easton, Pa.), and in 1857 professor there of the English language and comparative philology. He was among the earliest advocates of a historical study of the English language and of a philological study of the classic works of that lan-

guage. His contributions to the transactions and proceedings of the American Philological Association and other learned societies have been very extensive. He was a consulting editor of the 'Standard Dictionary,' and decided many spellings and forms for that work. He also edited the Douglass series of Christian Greek and Latin classics (1874–76), was director of the American readers for the great 'Historical Dictionary of English' of the London Philological Society, and published 'A Method of Philological Study of the English Language' (1865); 'Parser and Analyzer for Beginners' (1869); an 'Anglo-Saxon Grammar' (1870); an 'Anglo-Saxon Reader' (1870), an 'Introduction to Anglo-Saxon' (1871), 'Thesaurus Dictionary,' 5th edition, Philadelphia (1930).

MARCH, Peyton Conway, American soldier: b. Easton, Pa., 27 Dec. 1864. He is a son of Francis A. March, the philologist. Graduating from Lafayette College in 1884, he determined upon a military career, and graduated from the military academy in 1888. The same year he entered the army as a lieutenant of artillery. Later he graduated from the Fort Monroe Artillery School. When the Spanish War broke out he volunteered, and commanded the Astor Battery in 1898; the following year he was major of the 33d Volunteer Infantry. He served in Luzon, in the Philippine campaign, and received several promotions for gallantry. He obtained the surrender of General Venancio, Aguinaldo's chief of staff. For a time after the close of active hostilities he was a military and later a civil governor in Ilocus. In 1911 he was commissary-general in the Philippines; in 1916 he was a lieutenant-colonel of field artillery; the next year he was made a brigadier-general, and 5 Aug. 1917 he was raised to the rank of major-general. In 1918 he became Chief of Staff of the U. S. Army and in 1921 was retired.

MARCH, märh, Czechoslovakia, the principal river of Moravia, rising on the Silesian boundary, and flowing 214 miles southward to the Danube, which it joins six miles above Presburg. It is navigable for small boats from Göding, 50 miles from its mouth. In its lower course it forms the boundary between Austria and Hungary. Its chief affluent is the Thaya.

MARCH, in Europe, a frontier or boundary of a territory; especially applied to the boundaries or confines of political divisions; as, for example, the frontiers between England and Scotland, and England and Wales. Geneva is situated in the Marches of France, Savoy and Switzerland. See MARCHES, THE.

MARCH (Latin *Martius*), (1) the third month of the year, originally the first of the Roman year; so named in honor of the Roman deity Mars. Prior to 1752 the 25th of March was the first day of the legal year; hence, in all records, January, February and the first 24 days of March have frequently two years appended, as January 1, 170½ or 1701–2. (See CALENDAR). Until late in the 19th century, the custom of leasing dwellings from the 25th of March persisted in some localities. (2) A movement by regular steps in the manner of soldiers; also a journey performed by a body of soldiers either on foot or on horseback. Soldiers on a march are subject to certain rules very necessary to keep them in good order, and fit to meet the enemy. The march in the first sense of regular step differs on different occasions. In the parade-march from 75 to 95 steps, each of about 30 inches, differing in different armies, are made in a minute; in the quick-march from 108 to 115 steps; and in the double quick 150 running paces. This last cannot be sustained for any length of time, and is only used in a charge, or in storming a commanding position, and in a few internal movements of regiments. (3) A musical composition, chiefly for military bands, with wind instruments, primarily intended to accompany the marching of troops. There are slow and quick marches, and marches peculiar to different countries. Marches are also introduced into oratorios, the best-known examples being the 'Dead March' from the oratorio of 'Saul' and Mendelssohn's 'Wedding March.' See MUSIC.

MARCH FLIES, small, hairy, scavenging flies of the family *Bibionidæ,* seen numerously in early spring, often before the snow has disappeared. The species are over 300, and some appear in vast swarms. The maggots hatch in refuse or manure upon the ground, and are believed to feed upon grass-roots.

MARCH TO THE SEA. There were two plans for a march to the sea by Sherman's army, the first General Grant's, the second General Sherman's, modifying the first. A campaign to the sea to divide the Confederacy was decided upon by General Grant in January 1864, when he was in command of the Military Division of the Mississippi, with headquarters at Nashville. His objectives on the coast were first Mobile, second, Savannah, Atlanta being the intermediate objective for both. Sherman's army was then in the vicinity of Chattanooga, Tenn., and Ringgold, Ga.

In a letter to General Halleck, dated at Nashville, 15 Jan. 1864, General Grant wrote: "I look upon the next line for me to secure, to be that from Chattanooga to Mobile, Montgomery and Atlanta being the important intermediate points." This he repeated on 19 January to General Thomas, then in command of the Army of the Cumberland at Chattanooga, and this officer immediately began to gather information, which General Grant desired, of the number of troops necessary to guard the roads and bridges from Nashville to Atlanta. These preparations were entrusted to General Thomas, as General Sherman was engaged with his Meridian campaign. In this connection, General Thomas expressed his confidence in being able with the Fourteenth and Fourth corps in advance, covered with a strong division of cavalry, and the Eleventh corps in reserve, to overcome all opposition as far as Atlanta.

When Grant was made lieutenant-general and ordered east to command all the armies, he called Sherman to Nashville, and they traveled together as far as Cincinnati. General Sherman was then made acquainted with the plans already set forth. As part of these plans, before leaving Nashville General Grant ordered Banks to concentrate at least 25,000 men to move against Mobile in the spring in co-operation with General Sherman.

In addition to letters to each of the commanders interested — Halleck, Sherman, Thomas and Banks — General Grant, 26 March 1864, sent all army commanders a map upon

which was indicated by red lines the territory occupied by the Union forces at the beginning of the war, and at the opening of the campaign of 1864. The territory which it was proposed to occupy by the campaigns about to begin was indicated by the blue lines. This map reached General Sherman 4 April, and its receipt was acknowledged by him. This map is reproduced in the Atlas of the 'Official Records' of the war, being plate 135 A of that publication. For Sherman's proposed campaign the blue lines extend from Chattanooga to Atlanta, and from this latter point both to Mobile and Savannah.

General Sherman, in acknowledging the map, said: "That map to me contains more information and ideas than a volume of printed matter. Keep your retained copies with infinite care, and if you have occasion to send out to other commanders any more I would advise a special courier. From that map I see *all*, and glad am I that there are minds now at Washington able to devise; and for my part, if we can keep our counsels, I believe I have the men and ability to march square up to the position assigned me, and to hold it."

As the result of the campaign for Atlanta General Slocum occupied that city 2 September. Meantime Farragut had taken possession of Mobile Bay 5 August. On 10 September Grant telegraphed Sherman from City Point as follows: "As soon as your men are properly rested, and preparations can be made, it is desirable that another campaign should be commenced. We want to keep the enemy continually pressed to the end of the war. If we give him no peace while the war lasts, the end can not be far distant. Now that we have all of Mobile Bay that is valuable, I do not know, but it will be the best move for Major-General Canby's troops to act upon Savannah, while you move on Augusta. I should like to hear from you, however, on this matter."

To this Sherman telegraphed in reply: "If you can manage to take the Savannah River as high as Augusta, or the Chattahoochee as far up as Columbus, I can sweep the whole State of Georgia, otherwise I would risk our whole army by going too far from Atlanta."

In a letter from Atlanta, dated 20 September, Sherman gave Grant the conditions under which he could successfully co-operate in a movement on Savannah: "If you will secure Wilmington and the city of Savannah from your centre, and let General Canby have command over the Mississippi River and the country west of it, I will send a force to the Alabama and Appalachicola, provided you give me 100,000 of the drafted men to fill up my old regiments; and if you will fix a day to be in Savannah I will insure our possession of Macon and a point on the river below Augusta."

General Grant thereupon conferred by letter with General Halleck in regard to establishing a base on the coast for General Sherman and providing supplies, giving his own opinion that Savannah could be captured by troops from the East assisted by those in the Department of the South, and that the line of Augusta and Savannah would be a better one than Montgomery, Selma and Mobile. Grant further said in this letter 4 October: "Whichever way Sherman moves he will undoubtedly encounter Hood's army, and in crossing to the sea-coast will sever the connection between Lee's army and his section of the country."

General Sherman fixes the day after his letter of 20 September as the date when his plan of a march to the sea came first into his mind. It differed from Grant's plan based upon first disposing of Hood's army, in that it involved leaving Hood in his rear, to be taken care of by Thomas, and marching through to Savannah with no enemy in his front. Upon this plan a discussion arose with Grant, who for some time held to the necessity of first dealing with Hood. This discussion between Grant and Sherman lasted for several weeks. While it was in progress Hood became active. On 20 September Forrest's cavalry began vigorous operations about Athens and Decatur, Ala., and Pulaski, Tenn. Sherman at once sent troops to Chattanooga and 28 September General Thomas was ordered to proceed to Nashville to organize a force to meet a possible northward move of Hood. The first attempt of the latter was to break Sherman's communications by heavy movements upon his railroad. These met with only temporary success, as Sherman promptly pursued. The fighting at Allatoona 5 October was the most prominent affair. Hood then moved to the westward, and occupied Gadsden, Ala. Sherman again followed as far as Gaylesville. Sherman, 10 October, again proposed to Grant to leave Hood and march to the sea. Grant replied the same day. "If you are satisfied the trip to the sea-coast can be made, holding the line of the Tennessee firmly, you may make it, destroying all the railroads south of Dalton or Chattanooga as you think best." This condition of firmly holding the line of the Tennessee held Sherman for a time. Although this conditional permission had been given by Grant, he telegraphed Sherman 1 November: "Do you not think it advisable, now that Hood has gone so far north, to entirely settle with him before starting on your proposed campaign? With Hood's army destroyed you can go where you please with impunity." Sherman learned, 26 October, that Hood's army had appeared about Decatur. This clearly indicated an invasion of Tennessee. General Sherman then decided to strengthen General Thomas, leave him to take care of Hood, withdraw his own army to Atlanta and prepare for a march to the sea provided General Grant's consent could finally be obtained. He sent the Fourth and the Twenty-third corps back to Thomas. Thus the discussion with Grant over the question of first destroying Hood continued until 1 November, when, in response to a later telegram on that day from Sherman, which represented that Hood's whole force was only from 37,000 to 40,000, while Thomas would have from 63,000 to 70,000, and that he himself had retained only 50,000 men for his proposed campaign to the coast, General Grant telegraphed, "With the force, however, that you have left with General Thomas, he must be able to take care of Hood and destroy him. I really do not see that you can withdraw from where you are, without giving up all that we have gained in territory. I say then go on as you propose."

Having obtained this permission Sherman pushed his preparations with the greatest energy. The entire population of Atlanta had

already been deported; the various divisions of the army designed for the march were ordered to concentrate at Atlanta; all mills and factories at Rome were burned; the surplus stores, the sick, convalescent, and many thousands whose terms of service were about to expire were rushed to Chattanooga; the garrisons south of that place were withdrawn, and the railroad destroyed. Every command was carefully inspected, and soldiers found in any degree physically unsound were dispatched to Nashville. Care was taken that every man's accoutrements were complete. In the same way the horses, mules and trains were inspected. Wilson's cavalry was dismounted to make Kilpatrick's division perfect, and the remnants sent with Wilson to Nashville.

The march to the sea began on the morning of 15 November. As General Sherman wrote: "It surely was a strange event — two armies marching in opposite directions, each in the full belief that it was achieving a final and conclusive result in a great war;—" Hood's army, which had required the active work of three armies from May until September to push it back to Atlanta, had crossed the Tennessee at Decatur, strengthened by Forrest's cavalry and aiming for Nashville and the Ohio River. The situation at Nashville was thus described by Sherman: "General Thomas was at Nashville, with Wilson's dismounted cavalry and a mass of new troops and quartermaster's employees amply sufficient to defend the place. The Fourth and Twenty-third corps, under Generals Stanley and Schofield, were posted at Pulaski, Tennessee, and the cavalry of Hatch, Croxton and Capron, were about Florence, watching Hood. Smith's (A.J.) two divisions of the Sixteenth corps were still in Missouri, but were reported as ready to embark at Lexington for the Cumberland River and Nashville. Of course, General Thomas saw that on him would likely fall the real blow, and was naturally anxious."

Sherman started with 62,204 officers and men. Of his army he wrote: "The most extraordinary efforts had been made to purge this army of non-combatants and of sick men, for we knew well that there was to be no place of safety save with the army itself; our wagons were loaded with ammunition, provisions and forage, and we could ill afford to haul even sick men in the ambulances, so that all on this exhibit may be assumed to have been able-bodied, experienced soldiers, well armed, well equipped and provided, as far as human foresight could, with all the essentials of life, strength and vigorous action."

The artillery, wagon and ambulance trains were perfect. Each gun, caisson and forge was drawn by eight horses. There were 2,500 wagons with six mules to each, and the ambulances each had two horses. Each soldier carried 40 rounds, and in the ammunition wagons were 200 rounds for men and artillery.

The right wing, Gen. O. O. Howard, was composed of the Fifteenth and Seventeenth corps; the left wing, Gen. H. W. Slocum, of the Fourteenth and the Twentieth.

The war had not produced a more thoroughly organized and equipped army, or one in which more men had passed a thorough physical inspection. As it started for the sea, General Sherman in his 'Memoirs' thus describes the feelings of the men, and his own: "There was a devil-may-care feeling pervading officers and men, that made me feel the full load of responsibility, for success would be accepted as a matter of course, whereas, should we fail, this 'march' would be adjudged the wild adventure of a crazy fool." This question was to be decided at Nashville, as General Sherman wrote the day after he entered Savannah: "Thomas' complete success is necessary to vindicate my plans for this campaign—" The march to the sea cannot, therefore, be fully understood without considering the Nashville campaign as one of its essential parts. See NASHVILLE, CAMPAIGN AND BATTLE OF.

Sherman's army was composed of 55,329 infantry, 5,063 cavalry, and 1,812 artillery. There were two corps, 13 infantry divisions, one cavalry division, 36 brigades of infantry, two of cavalry and 16 batteries. There was no Confederate army between Atlanta and Savannah. Wheeler's cavalry was active on the flanks guarded by Kilpatrick's cavalry, and a considerable force of militia was encountered at Griswoldville.

The order for this historic march clearly presents its organization, its order of daily movement, its methods of living upon the country, the restrictions placed on its dealings with citizens, in short, the whole military machinery of the campaign. It, therefore, deserves a place in every history of the March to the Sea, General Sherman himself holding that no account of that event could be perfect without it It was as follows:

(Special Field Orders, No. 120).

Headquarters Military Division of the Mississippi. In the Field, Kingston, Georgia, November 9, 1864.

1. For the purpose of military operations, this army is divided into two wings, viz.:

The right wing, Major-General O. O. Howard commanding, composed of the Fifteenth and Seventeenth corps; the left wing, Major-General H. W. Slocum commanding, composed of the Fourteenth and Twentieth corps.

2. The habitual order of march will be, wherever practicable, by four roads, as nearly parallel as possible, and converging at points hereafter to be indicated in orders. The cavalry, Brigadier-General Kilpatrick commanding, will receive special orders from the commander-in-chief.

3. There will be no general train of supplies, but each corps will have its ammunition-train and provision-train, distributed habitually as follows: Behind each regiment should follow one wagon and one ambulance; behind each brigade should follow a due proportion of ammunition-wagons, provision-wagons, and ambulances. In case of danger, each corps commander should change this order of march, by having his advance and rear brigades unencumbered by wheels. The separate columns will start habitually at 7 A. M., and make about fifteen miles per day, unless otherwise fixed in orders.

4. The army will forage liberally on the country during the march. To this end, each brigade commander will organize a good and sufficient foraging party, under the command of one or more discreet officers, who will gather, near the route traveled, corn or forage of any kind, meat of any kind, vegetables, corn-meal, or whatever is needed by the command, aiming at all times to keep in the wagons at least ten days' provisions for his command, and three days' forage. Soldiers must not enter the dwellings of the inhabitants, or commit any trespass; but, during a halt or camp, they may be permitted to gather turnips, potatoes, and other vegetables, and to drive in stock in sight of their camp. To regular foraging-parties must be entrusted the gathering of provisions and forage, at any distance from the road traveled.

5. To corps commanders alone is entrusted the power to destroy mills, houses, cotton-gins, etc.; and for them this general principle is laid down: In districts and neighborhoods where the army is unmolested, no destruction of such property should be permitted; but should guerillas or bushwhackers molest our march, or should the inhabitants burn bridges, obstruct roads, or otherwise manifest local hostility, then army commanders should order and enforce a devastation more or less relentless, according to the measure of such hostility.

6. As for horses, mules, wagons, etc., belonging to the inhabitants, the cavalry and artillery may appropriate freely and without limit; discriminating, however, between the rich, who are usually hostile, and the poor and industrious, usually neutral or friendly. Foraging parties may also take mules or horses, to replace the jaded animals of their trains, or to serve as pack-mules for the regiments or brigades. In all foraging of whatever kind, the parties engaged will refrain from abusive or threatening language, and may, where the officer in command thinks proper, give written certificates of the facts, but no receipts; and they will endeavor to leave with each family a reasonable portion for their maintenance.

7. Negroes who are able-bodied and can be of service to the several columns may be taken along; but each army commander will bear in mind that the question of supplies is a very important one, and that his first duty is to see to those who bear arms.

8. The organization, at once, of a good pioneer battalion for each army corps, composed if possible of negroes, should be attended to. This battalion should follow the advance-guard, repair roads and double them if possible, so that the columns will not be delayed after reaching bad places. Also, army commanders should practise the habit of giving the artillery and wagons the road, marching their troops on one side, and instruct their troops to assist wagons at steep hills or bad crossings of streams.

9. Captain O. M. Poe, chief-engineer, will assign to each wing of the army a pontoon-train, fully equipped and organized; and the commanders thereof will see to their being properly protected at all times.

By order of Major-General W. T. Sherman,
L. M. Dayton, Aide-de-Camp.

Leaving Atlanta in ruins, 15 November, the left wing, which General Sherman accompanied, marched by Decatur, Stone Mountain and Covington. At this point it turned toward Milledgeville, the capital of Georgia, which was the first objective. It was reached on the 22d. Meantime the right wing had marched by Jonesboro, McDonough and Monticello, and was in communication with Sherman at Gordon. Kilpatrick's cavalry, which was operating on the right of the advance, kept in contact with Wheeler's cavalry, and reached the defenses of Macon, thence retiring to Griswoldville, where Walcutt's brigade of Wood's division was halted as a rear-guard. Gen. G. W. Smith attacked Walcutt, but was repulsed (see GRISWOLDVILLE, BATTLE OF). Governor Brown, the State officers and members of the legislature left the capital on Sherman's approach. The arsenal and various public buildings were destroyed.

The march was resumed 24 November, with Millen as the next objective. The two wings followed the general line of the railroad. Millen was reached 3 December. From Millen the army proceeded by the four main roads for Savannah. The effort of the Confederate authorities to organize a force at Augusta to attack Sherman in flank failed, and the march to Savannah was only slightly disturbed by the persistent skirmishing of Wheeler's cavalry. McLaw's division of Hardee's force had advanced to Ogeechee Church, but fell back to the city upon Sherman's approach. The several corps reached the defenses of Savannah 9 and 10 December, and occupied a line from the Ogeechee River on the right to the Savannah River on the left. Hardee occupied the city with something less than 10,000 men. Sherman's effective force numbered a little over 60,000. Hood held the Savannah River below Sherman's lines.

The march had cut a swath of many miles in width through the richest part of Georgia. The heads of the columns and the flanks swarmed with foraging parties, and a country which was daily scoured to supply food for a marching column of 60,000 soldiers was of necessity stripped of provisions, and of everything else that could contribute to the use or comfort of an army. Railroads had been destroyed for long distances, and all factories and other buildings burned which could contribute to army purposes. There had been no fighting worth mentioning, Griswoldville excepted, and that had only involved one Union brigade.

General Sherman had left Atlanta with 62,204 officers and men of all arms. He reached Savannah with 60,057. On the march 103 were killed, 428 wounded, 278 missing and 1,338 captured. Of those captured, a large proportion were foragers, better known in army vernacular as "bummers."

The night of 12 December a bridge had been completed over the Ogeechee, and the next morning Hazen's division crossed and marched at once to assault Fort McAllister (q.v.) and open the way to the sea. An hour before sunset the assault was delivered and the fort taken.

This success gave Sherman communication with the fleet which was awaiting him with supplies, and mails for the army.

General Slocum, upon establishing his flank on the Savannah River, had captured two steamboats and sent a force to Hutchinson and Argyle islands just above the city, and sought permission to transfer a corps to the left bank of the river to close Hardee's only line of escape, General Slocum having already sent a brigade under Col. E. A. Carman to the South Carolina shore. General Sherman did not deem this prudent, and as a result Hardee later withdrew his entire force intact and without molestation.

On 17 December General Sherman sent in a flag of truce demanding Hardee's surrender on the ground that he (Sherman) had received guns that could "cast heavy and destructive shot as far as the heart of the city"; that he controlled all avenues by which the city could be supplied with food; that he would grant liberal terms, but if forced to assault he should "feel justified in resorting to the harshest measures," and should make little effort to restrain his army.

General Hardee returned a defiant reply, saying he was not shut in, but had free and constant communication with his department. To the specific call for surrender he replied: "Your demand for the surrender of Savannah and its dependent forts is refused."

General Sherman then proceeded by boat to General Foster's headquarters at Hilton Head to request that a division be sent to occupy the road north of the Savannah River, which line of communication was still open to Hardee. On his return he received the news that during his absence Hardee had put down his bridges and withdrawn with his entire force. The next day General Sherman's forces occupied Savannah.

H. V. BOYNTON.

MARCHAND, mär-shäñ, **Félix Gabriel,** Canadian legislator and author: b. Saint John's, province of Quebec, 9 Jan. 1832; d. 1900. He was educated at Saint Hyacinth College, was admitted a notary public in 1855, entered practice at Saint John's, and from 1867 sat for the county of Saint John's in the legislative assembly of the province of Quebec. From 8 March 1878 to 19 March 1879 he was provincial secretary, from 19 March to 30 Oct. 1879 was commissioner of Crown lands, and from 29 Jan. 1887 to 1892 speaker of the assembly. In 1897 he became Premier, with the Treasury portfolio. Subsequent to the invasion at Eccles Hill during the Fenian troubles (1870), he commanded a militia brigade. He did much to improve Canadian journalism, and for many years was proprietor and editor of *Le Franco-Canadien.* He published a 'Manuel et Formulaire du Notariat'; and also the comedies 'Fatenville' and 'Erreur n'est pas Compte' in prose, and 'Un Bonheur en Attire un Autre' and 'Les Faux Brillants' in verse.

MARCHAND, Jean Baptiste, French officer: b. Thoissey, Ain, 1863; d. 14 Jan. 1934. He entered the army in 1883 and after gaining a commission three years later won fame as an explorer, particularly in Africa. He sought an improved route from the valley of the Niger to the Gulf of Guinea. He became one of the most notable figures in the French public life because of his clash with Lord Kitchener in 1898. Marchand had established the post of Fashoda on the White Nile and had resisted several attacks of the dervishes, when General Kitchener appeared at the head of a British force and requested Marchand to withdraw. The latter refused and soon after departed for France to make his report but the French government receded from its position and the threatened clash between England and France was averted. Marchand was present at the relief of Peking in 1902 and resigned his commission in 1904, when his government refused him permission to enter the Russian army in the war with Japan. He was made Commander of the Legion of Honor, was again in the French army with rank of general in the Great War, was severely wounded in 1915 and was retired in 1919. Consult Murphy, 'Le commandant Marchand et ses compagnons d'armes à travers l'Afrique' (Paris 1900).

MARCHANT, mär'chănt, **James,** English reformer: b. 18 Dec. 1867. He was educated in private and public schools and for some years was engaged as social writer and worker in East London and the provinces. In 1889–94 he was evidential lecturer to the bishop of Saint Albans; in 1895–97 preacher-in-charge of the Trinity Presbyterian Church, London; and in 1900–02 was civil minister of Saint Andrew's Church, Chatham. From 1903 to 1906 Mr. Marchant was secretary of Dr. Barnardo's Homes and Memorial. In 1905 he traveled on the Continent with Dr. Barnardo's successor investigating conditions of child-life and rescue work. In November 1911 he was dedicated to the work of the National Council of Public Morals in the private chapel of the dean of Westminster Abbey by the bishop of Durham and Rev. F. B. Meyer. His writings include 'Life of Dr. Paton' (1909); joint-author of 'The Memoirs of Dr. Bernardo' (1907); 'Letters and Reminiscences of Dr. A. Russel Wallace' (1916); 'History of the House of Cassell' (1917); 'The Master Problem' (1917); 'Coffins or Cradles' (1916); 'Birth-Rate and Empire' (1917); 'The Person of Christ'; 'Theories of the Resurrection' (1899); 'Anthology of Jesus' (1926); 'Deeds Done for Christ' (1928). He has also edited numerous publications.

MARCHES, The, Italy, a territory now included in the kingdom, but formerly constituting one of the legations of the Papal States. It comprises the region lying between the Apennines and the Adriatic, and is divided into the modern four provinces — Urbino and Pesaro, Ancona, Macerata and Ascoli Piceno. See ITALY.

MARCHESI, mär-kā'sē, **Mathilde,** German singer: b. Frankfort-on-Main, 26 March 1826; d. 17 Nov. 1913. Her maiden name was Graumann; she studied under Nicolai in Vienna, and in Paris under Garcia, whose assistant she became. A splendid mezzo-soprano she toured Europe for several years, married, in 1852, the Marchese della Rajata Castrone, a political Italian refugee of 1848, also a singer, who had adopted the *nom de théâtre* of Salvatore Marchesi, and in 1854 became professor at the Vienna Conservatory. She removed to Paris in 1861, where she published her «École de Chant.» In 1865 she accepted a professorship in Cologne, but resigned in 1868 and returned to Vienna, staying at the Conservatoire 10 years. She settled in Paris again in 1881, and prepared many of the greatest singers of the younger generation, including Melba. Her later years were spent in London, where she conducted a singing academy with her daughter. She was a teacher of rare merit, and author of a method of singing, of two volumes of personal recollections in German (1877; 1888), and of 'Marchesi and Music' (1897). She received decorations and medals from the rulers of Italy, Great Britain, Germany and Austria.

MARCHIALI, mär-kē-ä'lē, or **MARCHIALY.** See IRON MASK, MAN WITH THE.

MARCHING THROUGH GEORGIA, a popular ballad sung during the American Civil War, and commemorating Sherman's March to the Sea. It was written by H. C. Work (q.v.) 16 Nov. 1864.

MARCIL, mär'sēl', **Charles,** Canadian statesman and journalist: b. Sainte Scholastique, Quebec, 1 July 1860. He was educated in the common schools and at Ottawa University. In 1879 he became a member of the staff of the Montreal *Gazette,* and subsequently was successively member of the staffs of the *Herald,* the *Post, La Patrie,* and the *Star,* all of Montreal. In 1897 Mr. Marcil was an unsuccessful candidate for the Quebec legislative assembly for Gaspé County. In 1900 he was elected to the Dominion Parliament as Liberal member for Bonaventure; in 1905 he became deputy speaker and in 1909–11 was speaker of the House of Commons. Mr. Marcil became a member of the Privy Council for Canada in 1911. D. 30 Jan. 1937.

MARCION, mär'shi-ŏn, founder of a Gnostic sect, called Marcionites: b. Sinope about the beginning of the 2d century, A.D.; d. about 160. He became a wealthy shipowner, was very liberal, and went to Rome about 140 where he

gave generously to the Church but his views were so unusual that he was not warmly received. He attached himself while there to the Gnostic teacher Cerdo of Antioch, and founded a system antagonistic in many respects to Christianity. Its principal feature was the irreconcilable opposition which it supposed to exist between the Creator and the Christian God, and between the religious systems, the law and the gospel, which it believed they respectively founded The sect held the existence of three original principles — the supreme and invisible, whom Marcion called the Good; the visible God, the Creator; and the devil, or perhaps matter, the source of evil. Marcion could not perceive in nature, or in the Old Testament, the same love which was in the gospel of Christ. He accordingly made the Creator, the God of the Old Testament, the author of suffering. Jesus was not the Messiah promised by this being, but the son of the unseen God, who took the form but not the substance of man. Marcion denied the resurrection of the body; he condemned marriage, thinking it wrong to increase a race born in subjection to the harsh rule of the Creator. He rejected the whole of the Old Testament, and of the New all except a few epistles and a mutilation of the Gospel of Luke. He led quite a following, which is traced for 500 years, and then disappeared. Consult Tertullian, 'Contra Marcionem'; Harnack, 'History of Dogma.'

MARCO BOZZARIS. See Bozzaris, Marcos.

MARCO POLO. See Polo, Marco.

MARCOMANNI, märk-kō-măn'nī ("men of the marches," "borderers"), ancient German tribe, belonging to the federation of the Suevi. About 10 B.C., under their King Marbod or Maroboduus, they retired from their territory between the Elbe and the Oder before the advance of the Romans, settled in Bohemia, and there built up a powerful state, with which Tiberius made a treaty 6 A.D. Thirteen years later Maroboduus was defeated by Hermann, or Arminius, leader of the Cherusci, who also drove from power Catualda, Marbod's successor. About the middle of the 2d century the Marcomanni, with other Teutonic tribes, attempted to make inroads into Pannonia; they were defeated by Marcus Aurelius in 178; Commodus made peace with them in 180; they furnished Roman troops and were heavily subsidized till the time of Aurelian, when in 270 they were again rebellious and again driven across the Danube. In the 4th century the Marcomanni drop out of history.

MARCONI, Guglielmo, Italian inventor and electrical engineer: b. Marzabotto, Bologna, Italy, 25 April 1874; d. Rome, 20 July 1937. He was educated at Leghorn, under Prof. Rosa, and at Bologna University, and so early as 1890 undertook experiments in demonstration of his theory that the electric current readily passes through any substance, and when started in a given direction follows a direct course without the assistance of any sort of conductor. After various experiments in Italy, he finally invented an apparatus for wireless telegraphy, which was successfully tested in both Italy and England by Sir William Henry Preece, engineer and electrician-in-chief of the English postal-telegraph service. Marconi was the first to perfect the appliances used in space telegraphy or radiography, and the first to patent the application of the electric waves discovered by Heinrich Hertz to the purposes of actual telegraphy as distinguished from mere signaling. This remains true in spite of all the discussion respecting the originality of Marconi's work. It was he who combined the important elements of the wireless telegraph that had previously been invented, and to him the scientific triumph of so-called "wireless" telegraphy is due. He came to the United States in 1899, there continued his experiments, and in 1900 employed his method in reporting the presidential election of that year. He had sent (27 March 1899) messages across the English Channel from the vicinity of Boulogne, France, to the South Foreland, England, 32 miles distant. In December 1901 he began his first experiments in transatlantic telegraphy without wires at Signal Hill, at the entrance to the harbor of Saint John's, N. F. He succeeded with these because of an exceedingly sensitive magnetic detector, that was affected by the very faint etheric vibrations. When his success became apparent through his receiving and plainly distinguishing signals from the Poldhu Station, England, the Anglo-American Cable Company, which holds a monopoly from Newfoundland, compelled him to withdraw, and he selected another station at Table Head, on the east of Glace Bay, Cape Breton Island. On 25–26 Feb. 1902, Marconi, on his way to the United States on board the steamship *Philadelphia,* received signals at a distance of 2,099 miles and worded messages at a distance of 1,551.5 miles. On 21 Dec. 1902 the first official transatlantic telegrams were sent from Table Head. Marconi later (18 Jan. 1903) sent from the South Wellfleet station, Cape Cod, Mass., direct to Poldhu (3,000 miles), a message from President Roosevelt to King Edward. In 1910 the Argentina station received messages of 5,600 miles transit, and since then South American stations have sent and received abou 7,000 miles. The Italian government early introduced the Marconi system on its warships. and granted an annual subsidy of $200,000. The English government also paid a royalty for the use of the system on its ships. On 18 Oct. 1907 the Marconi system between Nova Scotia and Ireland was formally opened for commercial service.

He continued his experiments and inventions, continually improving radiography and the methods employed. In 1906 his new persistent wave system was introduced, and devices developed for giving desired forms to the wave energy sent out. In 1910 his detector was radically improved, and he also brought into use a new receiver. A little later he developed a duplex by which messages could be sent and received at the same time by the same apparatus, without conflict, as is done in regular wire telegraphy. Mr. Marconi received numerous honors, in Italy, England, America and also in Continental Europe. He divided the Nobel prize for physics with Ferdinand Braun in 1909. He was decorated in Britain, Russia and Spain, and received the Grand Cross of the Crown of Italy. The great universities of the world showered degrees on him; Edison accepted official position in one of his companies; he was nominated a senator in the kingdom of Italy, and given the

freedom of war. During the First World War he had charge of Italy's wireless services, at this period developing short-wave transmission as a means of secret communication. After the war he fitted his yacht for experimental purposes, using it as a floating laboratory. The last years of his life were devoted to experiments with short waves and with microwaves, which he believed held the secret of television.

MARCOU, mär-koo', **Jules,** American geologist: b. Salins, France, April 20, 1824; d. Cambridge, Mass., April 17, 1898. In 1848, having been appointed traveling geologist to the Jardin des Plantes, Paris, he went to the United States. He explored the Lake Superior country together with Louis Agassiz (q.v.), and made wide and important geological studies in Virginia, Pennsylvania and New Jersey. After several trips back to Europe, he settled in Cambridge, where he assisted Agassiz in the Museum of Comparative Zoology. From 1853 to 1855 he was in the employ of the United States government, and from 1875 till shortly before his death he was again in the service. Marcou made a section map of the 35th parallel from the Mississippi to the Pacific, and published *Geological Map of the United States and British Provinces of North America* (1853); *A Catalogue of Geological Maps of America* (1884); *Geology of North America* (1858); *Life, Letters and Works of Louis Agassiz* (1896).

MARCOUX, Joseph, Canadian missionary: b. Canada, about 1770; d. 1855. Soon after his ordination as a Roman Catholic priest, his ecclesiastical superiors dispatched him as missionary to the Iroquois. In 1819 he settled among these Indians at Caughnawaga, on the Saint Lawrence, near Montreal. The school and church at Caughnawaga were monuments to the zeal of this modern apostle. Father Marcoux acquired a perfect mastery of the Iroquois tongue, of which he published a grammar and dictionary. Other works by him in Iroquois were *Life of Christ; Letters to Iroquois Chiefs* (1848–49); *Prayer Book* (1852); *Catechism* (1854).

MARCUS, an island in the Pacific Ocean, north of the Tropic of Cancer, 700 miles northwest of Wake Island and about the same distance due east of the Volcano (Kazan) Islands. The Japanese took possession of it in 1899; subsequently they fortified the island, which had a garrison estimated to number 5,000 men when Japan entered the Second World War. A heavy raid on Marcus by United States naval vessels and carrier-based planes on Sept. 1, 1943, was the first of a series that continued through 1944, when it was attacked seven times from September to the end of the year. American assaults on the island were resumed in January 1945, and continued almost every month.

MARCUS AURELIUS ANTONINUS, mär'kŭs â-rē'lĭ-ŭs, often called simply MARCUS AURELIUS, Roman emperor: b. Rome April 29, 121 A.D.; d. Vindobona—the modern Vienna—March 17, 180 A.D. He was descended from an illustrious line which tradition declared extended to the good Numa, the second king of Rome. In the descendant Marcus were certainly to be found, with a great increment of many centuries of noble life, all the virtues of his illustrious ancestor. Doubtless the cruel persecutions of the infamous emperors who preceded Hadrian account for the fact that the ancestors of Aurelius left the imperial city and found safety in Hispania Baetica, where, in a town called Succubo —not far from the present city of Cordova—the emperor's great-grandfather, Annius Verus, was born. From Spain also came the family of the Emperor Hadrian, who was an intimate friend of Annius Verus. The death of the father of Marcus Aurelius when the lad was of tender years led to his adoption by his grandfather and subsequently by Antoninus Pius. By Antoninus he was subsequently named as joint heir to the imperial dignity with Commodus, the son of Aelius Caesar, who had previously been adopted by Hadrian. Among the many statues of Marcus extant is one representing him at the tender age of eight years offering sacrifice. He was even then a priest of Mars. It was the hand of Marcus alone that threw the crown so carefully and skilfully that it invariably alighted upon the head of the statue of the god. The great Emperor Antoninus Pius lived in the most simple and unostentatious manner, yet even this did not satisfy the exacting, lofty spirit of Marcus. At 12 years of age he began to practice all the austerities of Stoicism and became a veritable ascetic. He ate most sparingly; slept little, and when he did so it was upon a bed of boards. Only the repeated entreaties of his mother induced him to spread a few skins upon his couch. His health was seriously affected for a time; and it was, perhaps, to this extreme privation that his subsequent feebleness was largely due. His tutors, like Nero's, were the most distinguished teachers of the age; but unlike Nero, the lad was in every way worthy of his instructors. His letters to his dearly beloved teacher, Fronto, are still extant, and in a very striking and charming way they illustrate the extreme simplicity of life in the imperial household in the villa of Antoninus Pius at Lorium by the sea. In 140 he was made consul, and he held other offices before becoming emperor. He married Faustina, daughter of Antoninus Pius, about 145.

When his predecessor and adoptive father, Antoninus, felt the approach of death in 161, he gave to the tribune who asked him for the watchword for the night, the reply "Equanimity," directed that the golden statue of "Fortune" that always stood in the emperor's chamber should be transferred to that of Marcus Aurelius, and then turned his face and passed away as peacefully as if he had fallen asleep. The watchword of the father became the lifeword of the son, who pronounced upon that father, in the *Meditations,* one of the noblest eulogies ever written. Among the good works rendered to the empire during the 20 years of his reign were these: the establishment, upon eternal foundation, of the noble fabric of the civil law—the prototype and basis of Justinian's task; the founding of schools for the education of poor children; the endowment of hospitals and homes for orphans of both sexes; the creation of trust companies to receive and distribute legacies and endowments; the just government of provinces; the complete reform of the system of collecting taxes; the abolition of the cruelty of the criminal laws and the mitigation of sentences unnecessarily severe; the regulation of gladiatorial exhibitions;

the diminution of the absolute power possessed by fathers over their children and of masters over their slaves; the admission of women to equal rights to succession to property from their children; the rigid suppression of spies and informers; and the adoption of the principle that merit, as distinguished from rank or political friendship, alone justified promotion in the public service. But the greatest reform was the reform in the imperial dignity itself, as examplified in the life and character of the emperor. It is this fact which gives to the 'Meditations' their distinctive value. The infinite charm, the tenderness and sweetness of their moral teachings, and their broad humanity, are chiefly noteworthy because the emperor himself practised in his daily life the principles of which he speaks, and because tenderness and sweetness, patience and pity, suffused his daily conduct and permeated his actions. The horrible cruelties of the reigns of Nero and Domitian seemed only awful dreams under the benignant rule of Marcus Aurelius. It is not surprising that the deification of a deceased emperor, usually regarded by Senate and people as a hollow mockery, became a veritable fact upon the death of Marcus Aurelius. He was not regarded in any sense as mortal. All men said he had but returned to his heavenly place among the immortal gods. As his body passed, in the pomp of an imperial funeral, to its last resting-place, the tomb of Hadrian,—the modern Castle of Saint Angelo at Rome,—thousands invoked the divine blessing of Antoninus. His memory was sacredly cherished. His portrait was preserved as an inspiration in innumerable homes. His statue was almost universally given an honored place among the household gods. And all this continued during successive generations of men. Marcus Aurelius has been censured for two acts: the first, the massacre of the Christians which took place during his reign; the second, the selection of his son, Commodus, as his successor. In extenuation of his persecution of the followers of Christianity, it has been alleged in his behalf that he was deceived by evil councillors, who misrepresented the conduct of the Christians to him. This excuse impinges upon his wisdom as a ruler and his admittedly wide knowledge of the conditions of the empire. It is further urged that when we take into consideration the environment of the emperor, no just cause for condemnation of his course remains. He imbibed a bitter prejudice against the new religion from his beloved friend and instructor, Fronto. In the writings of Epictetus, whom he greatly revered, he found severe condemnation of the Christians as fanatics. With such a profound natural bias, it is urged, it is no wonder that he was led to regard the new creed with aversion. But the reason of his course is to be found rather in his deep-rooted attachment to the heathen beliefs of his ancestors and of the empire. It was rather his fear that the ancient cult, bound up as it seemed in the character of Roman rule, was seriously menaced by the progress of Christianity, which actuated him to the severe and bloody measures he took to root out a dangerous rival. He regarded Christianity as a "pernicious sect," a "secret conspiracy" against the empire, an "immoral superstition," whose poison was eating into the social life, and himself as the conservator of the empire and its traditions. Therefore some extenuation might be conceded to such fierce zeal in persecuting the Christians in almost any other emperor than Marcus Aurelius. But there is a glaring inconsistency in his character in the adoption of so cruel and monstrous a course by one who appears otherwise so admirable. In this signal instance he is as bloody and heartless as a Domitian, a Nero or a Caligula; in all other things merciful, in this pitiless; in his general administration, just and humane; in this, singularly unjust and even vindictive. Whatsoever may be urged in his defense, this relentless persecution of the Christians is a dark blot on his fame. Whatever extenuating circumstances may seem to condone it, his policy in this instance was utterly inconsistent with his general character.

His first edict against the Christians was published in 177. Multitudes perished in the fierce persecutions which followed. Notable amongst the victims were Saint Polycarp in Smyrna and Saint Cecilia at Rome. The manner in which they were tortured before being relieved from sufferings by death was more befitting a savage chief than a civilized ruler.

Of the appointment of Commodus as his successor, it may be said that the paternal heart hoped against hope for filial excellence. Marcus Aurelius believed, as clearly appears from many passages in the 'Meditations,' that men did not do evil willingly, but through ignorance; and that when the exceeding beauty of goodness had been fully disclosed to them, the depravity of evil conduct would appear no less clearly. The emperor who, when the head of his rebellious general was brought to him, grieved because that general had not lived to be forgiven; the ruler who burned unread all treasonable correspondence, would not, nay, could not believe in the existence of such an inhuman monster as Commodus proved himself to be. The appointment of Commodus was a calamity of the most terrific character; but it testifies in trumpet tones to the nobility of the emperor's heart, the sincerity of his own belief in the triumph of right and justice. Compare Farrar, 'Seekers after God' (1868); Renan, 'Marc Aurèle' (1881); Pater, 'Marius the Epicurean'; Arnold, M., 'Essays in Criticism' (First Series, New York 1883); 'Marcus Aurelius Antoninus to Himself' (English tr. by G. H. Randall, London 1910); 'The Communings with Himself of Marcus Aurelius Antoninus, Emperor of Rome, together with his Speeches and Sayings' (tr. C. R. Haines, London 1916); 'The Thoughts of the Emperor Marcus Aurelius Antoninus' (tr. George Long, illustr. W. Russell Flint, London 1909). Consult also Robinson, Ellis, 'Correspondence of Fronto and Marcus Aurelius' (Oxford 1904).

MARCUS GRÆCUS, grē'kŭs, alchemist, who lived not later than the 11th century, since he is cited by an Arabian physician of that date. In the National Library at Paris are two manuscript copies of a small treatise, entitled 'Liber Ignium ad Comburendos Hostes, Auctore Marco Græco,' one of which appears to belong to the 14th and the other to the 15th century. The work contains an account of an explosive substance the ingredients of which are the same as those used in making gunpowder, though differently proportioned. It may have been that Schwartz, the reputed inventor of gunpowder,

did nothing more than experiment on the lines indicated by Marcus Graecus.

MARCUS HOOK, borough, Pennsylvania, in Delaware County, on the Delaware River 18 miles west-southwest of Philadelphia. There are oil refineries, and manufactures of rayon and linoleum. Pop. (1940) 4,123; (1950) 3,843.

MARCY, Randolph Barnes, American army officer: b. Greenwich, Mass., April 9, 1812; d. West Orange, N. J., Nov. 22, 1887. Throughout the American Civil War he served as chief of staff to his son-in-law, Gen. George Brinton McClellan (q.v.), being appointed brigadier general in 1861 and brevet major general in 1865. From 1878 to 1881 he was inspector general of the United States Army.

MARCY, William Learned, American statesman: b. Sturbridge (now Southbridge), Mass., Dec. 12, 1786; d. Ballston Spa, N. Y., July 4, 1857. He studied at Leicester Academy, in Massachusetts, and was graduated at Brown University in 1808. At Troy, N. Y., he studied law and was admitted to the bar. When the War of 1812 broke out he volunteered as a lieutenant, and on Oct. 22, 1812, led an attack resulting in the capture of a Canadian post at Saint Regis. He was soon promoted to be captain, and served almost to the end of the war. Returning to Troy, he engaged in newspaper work and in politics, opposing DeWitt Clinton and becoming prominent in the Albany Regency (q.v.). He had already held several offices when, in 1823, he was elected comptroller of the state. This position he filled six years, and in 1829 was appointed associate justice of the New York Supreme Court. The Democrats in 1831 elected him to the United States Senate, but the next year he was chosen governor of New York and resigned his senatorship. While in the Senate he was chairman of the Judiciary Committee; in a debate with Henry Clay he made a memorable defense of Martin Van Buren. It was during a speech in the Senate vindicating the course of President Van Buren in giving offices to his political supporters that Marcy uttered the words associated with the beginning of the spoils system (q.v.): "We can see nothing wrong in the rule that to the victors belong the spoils." Having served three terms as governor, he was once more nominated in 1838, but was defeated by William Henry Seward (q.v.). In the following year Marcy was appointed by President Van Buren a commissioner on Mexican claims, serving till 1842. In 1845 he became secretary of war under President Polk, and in that office bore arduous responsibilities created by the Mexican War. He also used his official influence in the settlement of the momentous Oregon boundary question. In 1848 he supported Lewis Cass as presidential candidate, and when President Taylor was inaugurated Marcy retired to private life. But during the administration of President Pierce he served from 1853 to 1857 as secretary of state, greatly distinguishing himself at home and abroad by his handling of grave matters—the Mexican boundary dispute, the reciprocity treaty with Canada, the British fishery question, and the Koszta affair (see INGRAHAM, DUNCAN NATHANIEL).

MARCY, Mount, highest peak in the Adirondack Mountains, New York, in Essex County about 28 miles west of Lake Champlain. The altitude is 5,344 feet.

MARDEN, Charles Carroll, university professor: b. Baltimore, Md., Dec. 21, 1867; d. Princeton, N. J., May 11, 1932. He received his bachelor's degree in 1889 and his doctorate in romance languages in 1894 from Johns Hopkins University. He was established in the first American professorship in Spanish at Johns Hopkins University in 1905 and, in 1916, was elected to the Emery L. Ford chair of Spanish at Princeton University where he served until his death. He was managing editor of *Modern Language Notes* from 1911 to 1915 and, after serving as a member on the executive council of the Modern Language Association from 1924 to 1926, he served as president of the association in 1932. He wrote *A First Spanish Grammar* in 1926 (collaborating with F. C. Tarr) and edited *Poema de Fernan Gonçalez* in 1904 and *Cuatro Poemas de Berces* in 1928.

MARDEN, Orison Swett, American editor and author: b. Thornton, N. H., about 1850; d. March 10, 1924. He was graduated at the Boston University in 1877; at the school of oratory there in 1879; at the law school of the same institution in 1881; and in 1882 at the Harvard Medical School. He was founder and editor of *Success* and later of the *New Success,* and was the author of many works, among which are *Pushing to the Front* (1894); *How to Succeed* (1896); *The Secret of Achievement* (1898); *Character the Grandest Thing in the World* (1899); *The Hour of Opportunity* (1900); *Stepping Stones* (1902); *Every Man a King* (1906); *The Optimistic Life* (1907); *Why Grow Old* (1909); *Getting On* (1910); *Self Investment* (1911); *The Joys of Living* (1913); *The Crime of Silence* (1915); *Everybody Ahead* (1917).

MARDI GRAS, mär'dē grä, Shrove Tuesday, the last day before Lent. (See CARNIVAL.) In the United States the day is observed in New Orleans and Memphis with processions, masquerade balls, and other gay entertainments.

MARDONIUS, mär-dō'nĭ-ŭs, Persian general: d. 479 B.C. He was the son of Gobryas and son-in-law of Darius Hystaspis. He commanded the first Persian armament sent against Greece, 492 B.C., when a storm at Mount Athos destroyed his fleet, and his army was beaten in Macedonia. He accompanied Xerxes in his invasion of Greece, of which he had been the chief promoter; and after the battle of Salamis, and the return of Xerxes to Asia, Mardonius was left in occupation at Athens, which he held for 10 months. According to Herodotus he was defeated by Pausanias, and probably was killed at the battle of Plataea.

MARE AU DIABLE, La. See DEVIL'S POOL, THE.

MARE CLAUSUM, mā'rē klô'sŭm, a Latin phrase meaning closed sea, or that portion of the sea under the jurisdiction of a particular nation or government, as distinguished from the high sea. For many years it was held that a nation had no authority over waters more than three miles from its shores. See also INTERNATIONAL LAW; SEAS, FREEDOM OF.

MARE ISLAND, Calif., at the mouth of the Napa River and the head of San Pablo Bay, in Solano County, opposite Vallejo. In 1853 Mare Island was established by the United States Government as a navy yard. See also NAVY YARD.

MAREE, Loch, mȧ-rē′lŏĸ, Scotland, a lake in Ross and Cromarty County, forming a long and comparatively narrow expanse, stretching southeast to northwest for 12½ miles with a breadth of from one half to two miles. Its depth in most places is 60 fathoms; it has never been known to freeze. The scenery along its shores is bold and picturesque, and its surface is studded with 32 wooded islands, on one of which are found the remains of an ancient chapel, with a graveyard. One is Saint Swithin's Isle, shaped like a doughnut, enclosing a lake 750 feet long. The loch discharges itself into Loch Ewe by a small river of the same name.

MAREES, mä-rā′, **Hans von,** German historical painter: b. Elberfeld, Dec. 24, 1837; d. Rome, Italy, June 5, 1887. He painted in Munich from 1856 until 1864, when he moved to Rome, thereafter most of his life being spent in Italy. His most notable work was the execution of the frescoes in the library of the Zoological Museum in Naples, the commission for which was given to him in 1873.

MAREMMA, mȧ-rĕm′ȧ, Italy, a low, swampy region in the southwestern part of Tuscany, chiefly in Grosseto Province. It extends from the mouth of the Cecina to Orbetello, having a length of 92 miles, breadth of 6 to 20 miles, and area of about 1,000 square miles. Formerly these regions were fruitful, healthful and populous; but after the 15th century the neglect of the watercourses of the district permitted the formation of marshes and they generated insects and fevers and presented an aspect of dreary desolation during the summer months, when the inhabitants fled from the pestilences. In winter, on the other hand, the Maremma were habitable and afforded a luxuriant pasturage for cattle, which grazed in summer on the Apennines. The district was gradually reclaimed and improved in the 20th century.

MARENGO, mȧ-rĕng′gō, city, Iowa, seat of Iowa County, located on the Iowa River 25 miles west-southwest of Cedar Rapids. It is served by the Chicago, Rock Island and Pacific Railroad. The city is the center of a fertile agricultural and stock raising region. Food processing is the principal industry. Marengo was settled in 1845 and incorporated in 1859. Government is by mayor and council. Pop. (1940) 2,260; (1950) 2,151.

MARENGO, village, Italy, located in southeast Piedmont 5 miles east of Alessandria. In the vicinity, on June 14, 1800, Napoleon scored one of his greatest victories, defeating the Austrians commanded by Baron Michael Friedrich Benedikt von Melas (1729–1806). The Austrians were at first successful, but with the arrival of French reinforcements a cavalry charge led by Gen. François Étienne de Kellermann (q.v.) turned what looked like certain defeat into a decisive victory. The French lost about 4,000 men, including Gen. Louis Charles Antoine Desaix de Veygoux (q.v.); the Austrians, 9,500. The main consequence of the victory at Marengo was the cession of northern Italy to France.

MAREOTIS, mȧr-ē-ō′tĭs, or **MARYUT,** mŭr-yōōt′, Egypt, a salt lake separated from the Mediterranean on the west by the long, narrow strip of land on which stands part of the city of Alexandria. The most westerly of the lakes in the Nile Delta, it is about 28 miles long by 20 broad. At one time it was deep enough for inland navigation, and had its shores covered with beautiful gardens and vineyards. During the siege of Alexandria in 1801 the British let the sea into it, and it now yields great quantities of salt by evaporation.

MARE'S TAIL, a genus (*Hippuris*) of plants with whorled narrow leaves and small inconspicuous flowers set in their axils. They are aquatic or marsh plants. *H. vulgaris* is common in Europe and in some parts of North America.

MARESÇOT, Mount, peak, highest point (3,900 feet) on Santa Isabel Island, east central Solomon Islands, in the Pacific Ocean.

MARET, mȧ-rĕ′, **Hugues Bernard,** DUC DE BASSANO, French statesman: b. Dijon, 1763; d. Paris, 1839. An ardent supporter of the French Revolution, he published the debates of the National Assembly in the *Bulletin de l'Assemblée,* later expanded into the *Moniteur Universel.* After the monarchy fell in 1792 he undertook a diplomatic mission to London, and the next year he was sent to Naples as ambassador of the French Republic. Seized by the Austrians, he was imprisoned at Brünn until 1796. During 1797 he conducted negotiations with Great Britain, and after Napoleon became first consul of France in 1799 Maret became the latter's confidential adviser. He was created a count in 1807 and duke of Bassano (q.v.) in 1809, and from 1811 to 1813 he was minister of foreign affairs. During the Hundred Days (q.v.) he was minister of state, but after Napoleon went into exile in 1815 he was banished from France. In 1820 he was permitted to return, and Louis Philippe created him a peer of France in 1831.

MARETZEK, mä′rĕ-tsĕk, **Max,** American musician: b. Brünn, Moravia, Jan. 28, 1821; d. Pleasant Plains, Staten Island, May 14, 1887. He was educated at the University of Vienna, but desirous of a wider field went to London and was connected for a time with its Italian Opera as chorus-master, writing in addition some music. In 1848 he came to New York, where he was appointed leader of the orchestra at the Italian Opera and subsequently at the Astor Place Theatre and the Grand Opera House. He wrote the operas of *Hamlet, Sleepy Hollow,* and an interesting book on contemporary life entitled *Crotchets and Quavers* (1858). Under his management many notable operas and artists, among the latter Adelina Patti and Pauline Lucca, were presented to American audiences.

MAREY, mȧ-rā′, **Étienne Jules,** French physiologist: b. Beaune, 1830; d. Paris, 1904. He became a professor of natural history on the faculty of the Collège de France in 1867, and he made investigations on the physiology of circulation and the heart, on the action of poisons, on animal heat, and motion in animals. He invented the

improved form of the sphygmograph (q.v.) in 1863.

MARFA, mär'fȧ, city in western Texas and Presidio County seat, on the Texas and New Orleans railroad about 175 miles southeast of El Paso and about 55 miles from the Rio Grande, at the foot of the Davis Mountains; alt. 4,688 feet. It is a trading center for large livestock ranches, shipping cattle, goats, sheep and mohair. The brisk mountains in the vicinity are increasingly visited by tourists and hunters. Silver was once mined in the region. Outside Marfa is Fort D. A. Russell, an old army post set up in 1833. The city, founded in 1884, was incorporated in 1887. Pop. (1950) 3,603.

MARGARET, Saint, a 3d-century virgin and martyr, said to have been born in Antioch as daughter of a pagan priest. She performed several miracles until martyred (about 275, some sources give 307) for refusing to abandon her faith. Known in Greek as Marina, she is held to be identical with St. Pelagia. Her day is July 20 (Greek church: July 17).

MARGARET, Saint, queen of Scotland, elder sister of Edgar Aethling, and granddaughter of Edmund Ironside: b. Hungary about 1045; d. Edinburgh, Scotland, Nov. 16/17, 1093. She and her brother Edgar went to Scotland and placed themselves under the protection of Malcolm III Canmore, the Scottish king, who, c.1067, became her husband. It was largely through her influence with the king that the Scottish Church was brought into conformity with those of England and the Continent. Margaret is said to have elevated the manners of the Scottish court and to have set a noble example to the people. In 1251 she was canonized. Her daughter Matilda married the English king, Henry I, and thus the old Anglo-Saxon line became united with that of the usurping Normans. Her feast is June 10.

MARGARET, queen of Denmark, Norway and Sweden, sometimes called "The Semiramis of the North," daughter of Waldemar IV, king of Denmark: b. Søborg, near Copenhagen, Denmark, 1353; d. Flensburg (now Germany), Oct. 28/29, 1412. Married to Haakon VI, king of Norway, in 1363, the death of her husband in 1380 placed Norway in her hands; that of her son Olaf in 1387 enabled her to secure also the throne of Denmark; and after defeating Albert of Mecklenburg, the Swedish king, she obtained possession of the throne of Sweden as well. She endeavored to place the union of the three kingdoms on a permanent basis by the celebrated Act of Union or Treaty of Kalmar (1397).

MARGARET OF ANJOU, ăn'jōō or ănzhōō', queen consort of Henry VI of England: b. probably at Pont-à-Mousson, Lorraine, France, March 23, 1430; d. Dampièrre, near Saumur in Anjou, France, Aug. 25, 1482. The daughter of René the Good of Anjou, titular king of Naples, she was married to Henry in 1445. The imbecility of the king made her practically regent, and her power being contested by the Duke of York, a claimant of the throne by an older line, the protracted Wars of the Roses began. At first victorious, she was afterward compelled to flee to Scotland, but raising an army in the north, she secured by the battle of Wakefield (1460) and the 2d battle of Saint Albans (1461) the death of York, and the release of the king. Her army, however, was soon afterward annihilated at Towton (1461), and Edward IV, the son of the late Duke of York, was declared king. In a last attempt, Margaret, collecting her partisans, fought the battle of Tewkesbury (1471), and was totally defeated. She and her son were made prisoners, and the latter, when led into the presence of the royal victor, was killed. Henry soon after died or was murdered in the Tower, and Margaret remained in prison for almost five years. Louis XI ransomed her (1476) for 50,000 crowns. See also HENRY VI; ROSES, WARS OF THE.

MARGARET OF AUSTRIA, regent of the Netherlands, and daughter of Maximilian I of Austria: b. Brussels, now Belgium, Jan. 10, 1480; d. Mechlin, now Belgium, Dec. 1, 1530. Educated at the French court, she was betrothed to the Dauphin Charles (later Charles VIII), who, however, married Anne of Brittany. She married instead John, the Spanish crown prince, in 1497; and, after his death in the same year, married Philibert II of Savoy in 1501, only to be widowed again in 1504. Three years afterward her father made her regent of the Netherlands, where she ruled with much ability, although a bitter enemy of the Reformation. She took a prominent part in the peace of Cambrai in 1529, which is called, because negotiated by her and Louise of Savoy, the "Paix des Dames."

MARGARET OF CARINTHIA, kȧ-rĭn'-thĭ-ȧ, or **MARGARET MAULTASCH,** moul'-tȧsh, countess of Tirol: b. 1318; d. Vienna, Austria, Oct. 3, 1369. She retained rule over the Tirol after her father's death (1335) despite the opposition of Emperor Louis IV. After divorcing her husband John Henry, son of the king of Bohemia, she married the Emperor's son, Louis, margrave of Brandenburg. In 1363 she abdicated. Also called Ugly Duchess (the title of a historical novel by Lion Feuchtwanger), she has become almost proverbial for her rancor and hideous looks.

MARGARET OF FLANDERS, countess of Flanders and Hainaut, sometimes called Margaret of Constantinople: b. Valenciennes, France, about 1200; d. Lille, France, Feb. 10, 1279. She was a daughter of Baldwin IX of Flanders and Hainaut (Baldwin I of Constantinople), who was succeeded by her older sister, Jeanne. Upon the latter's death in 1244 Margaret acceded. Her son by a first marriage, Jean d'Avesnes, took Hainaut (1246), but she retained Flanders.

MARGARET or **MARGUERITE OF NAVARRE,** nȧ-vär', queen of Navarre, variously known as Margaret of Angoulême, of Orléans, and of Valois: b. Angoulême, France, April 11, 1492; d. Odos en Bigorre, Hautes-Pyrénées, France, Dec. 21, 1549. The daughter of Charles d'Orléans, Count of Angoulême, and a sister of Francis I of France, she was brought up at the court of Louis XII and married the Duke of Alençon in 1509. Widowed in 1525, she married in 1527 Henri d'Albert, titular king of Navarre. She resided at the French court or at Nérac and Paul. A protector of Protestant reformers, she was also a great patroness of men of letters. In 1533 she published a re-

ligious poem, *Le Miroir de l'Ame Pécheresse,* which incurred the censure of the Sorbonne as heretical. In 1547 a collection of her poems and other pieces was printed under the title of *Marguerites de la Marguerite des Princesses.* The *Heptaméron, ou sept Journées de la Reyne de Navarre,* a famous collection of tales long attributed to her exclusively, is probably of composite authorship. She left one child, Jeanne d'Albret; afterward mother of Henry IV of France. See HEPTAMERON, THE.

MARGARET OF PARMA, regent of the Netherlands: b. Oudenarde, 1522; d. Ortona, 1586. She was also known as Margaret of Austria. She was a natural daughter of Charles V of Spain by a Flemish woman. Brought up in Brussels, she was married to Alessandro de Medici in 1536, and in 1538 to Ottavio Farnese, duke of Parma, to whom she bore the great general, Alexander Farnese. In 1559 Philip II made her regent of the Netherlands. There she sided with Cardinal de Granvelle, introduced the Inquisition and provoked the provinces to revolt by her strong, masculine policy. She resigned in 1567 when the duke of Alva was sent to the Netherlands.

MARGARET OF VALOIS, OF FRANCE, known as QUEEN MARGOT: b. Saint Germain-en-Laye, France, May 14, 1553; d. Paris, March 27, 1615. She was the daughter of Henry II of France and Catherine de Médicis. She married in 1572 Henry of Navarre, afterward Henry IV of France. It was entirely a marriage of policy, and on Henry's accession to the throne their marriage was dissolved by mutual consent. She resided thereafter in Paris where her house became the rendezvous of the learning and fashion of the time. Some very agreeable poems by her are extant and her *Memoirs* (1842) are extremely interesting.

MARGARET TUDOR, queen of Scotland, wife of James IV and daughter of Henry VII of England: b. Westminster, Nov. 29, 1489; d. Methven Castle, Oct. 18, 1541. She was married to the king of Scotland when 14; bore him three children, of whom two, James, later fifth king of Scotland of that name and father of Mary Stuart, and Margaret, mother of Lord Darnley, survived her; and after the king's death (1514) married Archibald Douglas, earl of Angus, from whom she was divorced in 1527, to marry soon after Henry Stewart, lord of Methven. By descent from Margaret Tudor her great-grandson, James VI of Scotland, was Elizabeth's successor as James I of England.

MARGARETTA, The, a British armed schooner, captured by Americans near Machias, Me., June 12, 1775, in the first naval contest of the American Revolution.

MARGARIC ACID, name formerly given to an acid having the chemical formula $C_{17}H_{34}O_2$, and supposed to exist in natural fats. Later the name came to be applied only to an acid obtained by boiling cetylic cyanide with potassic hydrate solution.

MARGARINE, mär'jär-ĭn, a concentration of highly refined vegetable oils emulsified in fresh pasteurized skim milk. Domestic vegetable oils, primarily soybean and cottonseed, contribute practically all of the fats and oils used in American margarine. Margarine consists of 80 per cent fat content by weight which is made up of highly refined oils. Approximately 16 per cent by weight is pasteurized, cultured skim milk. The remainder is made up of salt, Vitamin A, and minor ingredients. Margarines are emulsified under scientific control so that the finished product is a smooth-textured spread for bread.

Hippolyte Mège-Mouriès, a French scientist, invented the product now known as margarine as a result of a contest sponsored by Napoleon III for a palatable table fat. Mège-Mouriès won the prize and the product was patented in England in 1869. A small production in France was resumed after the Franco-Prussian War in 1870.

In 1874, margarine was introduced into the United States during a period when a surplus of farm products was being produced. Almost immediately 22 states levied discriminatory taxes on the product to give butter a frankly competitive advantage. Federal legislation, which was to last 64 years, went into effect in 1886. This legislation consisted of taxes and restrictions designed to curtail the sale of margarine. Amendments increasing the severity of the original law were passed in 1902 and 1930. Congress repealed these restrictions by the act approved March 16, 1950, effective July 1, 1950. The new law:

(1) Repealed all federal taxes on yellow and white margarine and annual license fees on retailers, wholesalers and manufacturers handling yellow and/or white margarine.
(2) Defines the product as "margarine."
(3) Stipulates labeling requirements on the package so as to leave no doubt that the consumer would be purchasing margarine.
(4) Specifies notification and serving requirements for public eating places serving yellow margarine as follows:
    (a) A sign must be displayed or a notice carried on the menu stating that margarine is served and,
    (b) Each separate serving must be in triangular shape or bear or be accompanied by labeling identifying it as margarine.

Margarine today bears little resemblance to the product manufactured before the turn of the century. Its ingredients and technology have radically changed. During the early part of this century, methods of refining vegetable oils were materially improved, thus leading to the gradual increase in the use of vegetable oils in margarine. Odors and flavors were eliminated, producing a blandness which would then readily absorb the flavor of the milk to be incorporated. The shortage of fats during and after World War I intensified the trend toward wider use of vegetable oils and for the first time soybean oil was used in significant quantities.

With the discovery of new processes in 1937, cottonseed oil became the major fat ingredient, supplanting coconut oil, which was temporarily a major fat contributor Since that time American cottonseed and soybean oil have been the two major fat ingredients. Margarine is now second only to shortening as the major user of soybean and of cottonseed oil and is thus of vital interest to American farmers. In 1951, for example, the value of soybean oil used in the production of

margarine was estimated at 79 million dollars and the value of cottonseed oil used amounted to 60 million. Cottonseed oil amounted to 56.8 per cent of all the oils used in margarine production in 1950. For the same year soybean oil contributed 39.5 per cent while the remaining 3.7 per cent included corn oil, peanut oil, and other vegetable and animal fats and oils. Milk products make up about 16 per cent of margarine, amounting to 166,000,000 pounds of skim milk in 1951. Since only about one per cent of margarine contains meat fat, which refers to "oleo," the term "oleomargarine" has become inaccurate. Some existing laws, however, still require that margarine be labeled with its out-of-date name.

Margarine is manufactured and distributed under the Federal Food, Drug and Cosmetic Act and the similar laws of the various states. In 1941 the United States Food and Drug Administration established the "Definition and Standard of Identity for Oleomargarine" in order to assure consumers a product of uniformly high quality. As amended effective Aug. 18, 1952, this regulation sets forth required and optional ingredients; fixes the fat content at 80 per cent; permits coloring; and requires each pound that is fortified with Vitamin A be fortified with a minimum of 15,000 U.S.P. units. The standard, following the act of March 16, 1950, recognizes the word margarine as well as oleomargarine to describe the product.

Leading authorities have long recognized the high food value of margarine. The following nutritional experts have attested that margarine is the nutritional equal of any other table spread: The American Medical Association's Council on Food and Nutrition; The United States Department of Agriculture, which includes margarine on its "Basic 7" food list; The Food and Nutrition Board of the National Research Council; The New York Academy of Medicine's Committee on Public Health Relations; and the United States Army. One scientific test, the results of which appeared in the American Medical Association *Journal*, February 7, 1948, concluded that "Growing children experience normal growth in height and weight when their diets contain only fortified margarine as table fat, as shown by comparison with children fed on similar diets with butter as the source of table fat . . ." and "Whether the greater part of the fat of the diet is derived from vegetable or animal sources has no effect on growth and health. . . ."

The Committee of Public Health Relations of the New York Academy of Medicine has said: "From a nutritional viewpoint, when it is fortified with Vitamin A in the required amount, oleomargarine is the equal of butter, containing the same amounts of protein, fat, carbohydrates and calories per unit of weight. Moreover, since the minimum Vitamin A content of 'enriched' margarine is fixed, and the amount of this Vitamin A in butter may range from 500 to 20,000 units per pound, 'Enriched' oleomargarine is a more dependable source of Vitamin A than is butter. Since it is a cheaper product than butter, fortified oleomargarine constitutes a good vehicle for the distribution of Vitamin A and fats. . . ."

With the advent of World War II margarine consumption increased rapidly despite restrictive regulation. In 1941 the average per capita consumption of margarine was 2.7 pounds. At the close of the war in 1945 consumption reached a new high of 3.8 pounds per capita, and continued to increase. Public interest in removing discriminatory restrictions on the product, manifested over many years and successful in several states, crystallized. Although a large majority—consumer, farm, labor, grocer and other groups—asked for federal and state repeal actions, butter interests almost alone sought to keep the restrictions on the grounds of protecting the price of butter. On April 28, 1948, a repeal bill was passed by the House of Representatives by a heavy majority, but adjournment prevented any action by the Senate.

Further hearings before the 81st Congress resulted in another repeal bill being passed by the House of Representatives by a large majority on April 1, 1949. On Jan. 18, 1950, the bill, with certain amendments, was easily passed by the Senate and became law as of July 1, 1950. Certain labeling requirements and other provisions were incorporated with the purpose of safeguarding the sale of margarine.

New York State and Washington State repealed bans on the sale and manufacture of yellow margarine in 1952, the latter in a popular referendum, reducing to only six the number of states still prohibiting such sale. In the six—Iowa, Minnesota, Montana, South Dakota, Vermont, and Wisconsin—consumer, dealer, and farm groups are seeking repeal.

The situation for butter is quite different. Per capita butter consumption declined from 16.9 pounds in 1940 to 9.7 pounds in 1951. The amount of milk used in buttermaking declined from 40 per cent in 1940 to 24.6 per cent in 1951.

Thus, though margarine consumption has almost trebled since 1940 butter consumption has nearly halved, the result being that combined consumption of both is less today (1952) than a decade ago. This leaves a "nutritional gap" in table fat consumption. Some dietitians feel that margarine can fill this "nutritional gap."

CLARA GEBHARD SNYDER,
Food Consultant.

MARGARITA, mär-gä-rē'tä, Venezuela, an island off the northeast coast, in the Caribbean Sea, about 35 miles north of Cumana. In 1901 it was made a province and is known by the name of Nueva Esparta. Its area is 450 square miles. This island was discovered by Columbus in 1498; it was settled by the Spanish about 1525. The name Margarita, meaning "pearl," was given to it because of the pearl fisheries still existing in surrounding waters. The capital of the province is La Asunción; the chief port Pampatar. The natives are mostly civilized Indians. Pop. (1950 est.) 62,381.

MARGATE, mär'gāt, England, a seaport and popular summer watering resort of Londoners, in Kent, in the Isle of Thanet division, 64 miles by rail east of London. The restored parish church of Saint John the Baptist dates from 1050. It was originally a fishing village, but began to develop as a resort about the year 1800. Its sea walks are continuous with those of Westgate and Broadstairs.

MARGATE FISH, a handsome, pearly white, brown-striped fish (*Haemulon album*) of West Indian waters, important as a food fish.

MARGHERITA, queen dowager of Italy: b. Turin, Nov. 20, 1851; d. Jan. 4, 1926. She was

the daughter of Ferdinand, Duke of Genoa. In 1868 she was married to Humbert, then crown prince of Italy, who ascended the throne of Italy in 1878. In that same year an attempt was made upon the life of the king, and the nervous shock to the queen seriously affected her health for a number of years. Her winning personality and dignified performance of her duty as queen gained her wide popularity in Italy. In 1900 her husband was assassinated and their son, Victor Emmanuel III, succeeded him as king.

MARGHERITA PUSTERLA, for many years the most popular historical novel in Italy with the exception of Manzoni's masterpiece, *I promessi sposi,* was written between 1833 and 1834 while the author, Cesare Cantù, lay in prison charged with political offenses against the Austrian authorities. Composed under great difficulties, suppressed by the foreign oppressors who felt themselves attacked through this work, the novel was not published till 1838. The theme deals with the period of the Italian despots of the 14th century—a period which had already been treated in Tommaso Grossi's *Marco Visconti* (1834), to which novel Cantù alludes in his own work. The scene is laid in Milan in 1340–1341 during the reign of Luchino Visconti. The latter attempts to seduce Margherita, the wife of the rich and noble Franciscolo Pusterla. Rebuffed by her, the tyrant seeks revenge by sending to the scaffold husband, wife and their young son, a mere child, after having had the parents condemned for treason against the state and conspiracy against his life. Vain attempts to save his master and mistress by the devoted young squire, Alpinolo, an effort to deter the vindictive Luchino from his cruel purpose on the part of the good monk Fra Buonvicino (a replica of the famous Fra Cristoforo of *I promessi sposi*), heighten the interest of this somber tale. With the exception of the impulsive and engaging Alpinolo, the sardonic court-jester Grillincervello and the saintly Fra Buonvicino, the characterization is mediocre. The book owes its success to the splendid pictures of mediaeval life and to the pathos and horror of its situations. The execution of Margherita Pusterla, a powerful but revolting scene, has been much admired. For a historian of no mean ability, Cantù, as has been justly pointed out by Mazzoni, makes curious blunders and takes singular liberties with his sources. Written when Romanticism was supreme in Italy, *Margherita Pusterla* is an imitation of *I promessi sposi* combined with an attempt to rival the vast panoramas, the highly colored realism and the violent contrasts of *Notre Dame de Paris.*

ALFRED G. PANARONI.

MARGOLIOUTH, mär-gō'lĭ-ŭth, *later* mär-gŭl-yōōth, **David Samuel,** English Arabic scholar: b. London, Oct. 17, 1858; d. Mar. 23, 1940. He was educated at Oxford, and was Laudian Professor of Arabic at Oxford in 1889–1937. His published works are associated chiefly with Arabic literature, and include *Letters of Abul Ala* (1898); *Mohammed and the Rise of Islam* (1905); *Yakut's Dictionary of Learned Men* (edited in Arabic, 1907–25); *The Homer of Aristotle* (1924).

MARGOLIS, Max Leopold, American Hebrew philologist: b. Merech, Vilna, Russia, Oct. 15, 1866; d. April 2, 1932. In 1889 he was graduated at the Leibniz Gymnasium, Berlin, and in 1890 received the degree of A.M. at Columbia University and the degree of Ph.D. the following year. In 1892 Dr. Margolis was lecturer on Jewish literature at the Glenmore School for Culture Sciences, Keene, N. Y. From 1892 to 1897 he was connected with the Hebrew Union College, Cincinnati, as assistant professor of Hebrew and Biblical exegesis. In 1897 he became professor of Semitic languages and literatures at the University of California, where he was associate professor from 1898 to 1905 In 1905–07 he held the chair of Biblical exegesis at Hebrew Union College. In 1907–1908 Dr. Margolis visited European libraries and in the following year was editor-in-chief of Bible translation for the Jewish Publication Society of American. From 1909 he was professor of Biblical philology at the Dropsie College for Hebrew and Cognate Learning, Philadelphia. He was the author of *Commentarius Isaacidis quatenus ad textum talmudicum investigandum adhiberi possit tractatu Erubhin ostenditur* (1891); *The Columbia College Manuscript of Meghilla* (1892); *An Elementary Text-Book of Hebrew Accidence* (1893); *The Theological Aspect of Reformed Judaism* (1904); *The Holy Scriptures with Commentary on Micah* (1908); *A Manual of the Aramaic Language of the Babylonian Talmud* (1910); *The Story of Bible Translations* (1917); *The Hebrew Scriptures in the Making* (1922); and contributions to philological and theological publications. In 1922 Dr. Margolis became editor of the *Journal* of the American Oriental Society.

MARGRAVE, in mediaeval times, in continental Europe, a border count or commander entrusted with the protection of a *mark,* or district on the frontier. As early as the times of Charlemagne marks and margraves appear. The margraves stood immediately under the German kings and emperors. In the 12th century margraviates became hereditary and at last the margraves acquired the rank of princes of the empire, between counts and dukes.

MARGUERITE, mär'gĕ-rēt, a popular name for several flowers of the family *Asteraceae.* The blue marguerite (*Felicia amelloides*), or blue daisy, is a native of southern Africa, and has long been popular in greenhouses and window gardens because of its simple culture and large solitary flower-heads. The Paris daisy or marguerite (*Chrysanthemum frutescens*), a native of the Canary Islands, was introduced into cultivation in Great Britain about the close of the 18th century and has continued a popular florist's flower ever since. It is the one usually obtainable throughout the year in the stores, but especially during the winter. Because of a close resemblance, the name is applied to its near relative, the ox-eye daisy (*C. leucanthemum*), which is common in mismanaged pastures and fields, especially in the New England and adjacent States. The Reine marguerite (*Callistephus hortensis*) is better known in America as China aster (see ASTER) and is one of the most popular out-of-door annuals of the garden, being easily grown from seed and readily adaptable to any garden soil. The English daisy (*Bellis perennis*) is also called marguerite, but less frequently.

MARIA II, usually known as **Maria da Gloria,** thä glō'ryà, queen of Portugal: b. Rio de Janeiro, April 4, 1819; d. Lisbon, Nov. 15, 1853. She was a daughter of Dom Pedro I of Brazil and on the death of her grandfather, John VI of Portugal in 1826, her father ceded to her the succession to the throne. Her uncle, Dom Miguel, to whom she was betrothed was appointed regent, but in 1828 upon the sailing of the young queen for Spain he usurped the throne and barred the landing of the queen. In 1832–1833 Dom Pedro instigated a civil war against his brother and, through the intervention of England and France, Maria was placed on the throne in 1834. She married Duke Ferdinand of Saxe-Coburg and though retaining her throne had a troubled and rather unsuccessful reign. Upon her death her son, Pedro V, ascended the throne.

MARIA CHAPDELAINE, a novel of French-Canadian pioneer life written by Louis Hémon while he was working on a farm, also the locale of the story, near Péribonca, Quebec. It was first published in a Paris newspaper in Jan., 1914. The lives of Samuel Chapdelaine's family revolve around the ceaseless struggle to wrest a farm from the unbroken forest of the St. Johns Lake country. Maria, his daughter, loves François Paradis, a young trapper. Before they can be married, Paradis is lost in the winter's snow and dies. In the spring, Maria refuses Lorenzo Surprenant who offers her the pleasures of civilization, and gives her promise of marriage to a neighboring farmer, choosing to live the life her parents had lived, in the open, beside the forest. This simple story of devoted resignation, unaffectedly told, gives a vivid picture of the compensations of pioneer life.

MARIA CRISTINA, queen of Spain: b. Austria, July 21, 1858; d. Madrid, Feb. 6, 1929. She was the daughter of Archduke Karl Ferdinand of Austria, and was married by proxy to Alfonso XII of Spain in 1879. At the death of Alfonso XII in 1885, she was appointed queen-regent during the minority of her daughter, Queen Mercedes, who was succeeded six months later by Alfonso XIII, a posthumous son. The queen-regent faced a difficult problem; she was a foreigner, the people were unsympathetic, and the political and financial condition of the country was in a precarious state. She formed a new cabinet with Sagasta, the Liberal leader at its head, and soon won the hearts of her people by her wise and able rule. Throughout the time of her regency she commanded the respect and admiration of the world as well as her own country for her clear, far-sighted administration of the affairs of state and her careful training of the young king whom she endeavored to inspire with her own high sense of the responsibilities of his position. Even the disastrous outcome of the Spanish-American War failed to unsettle the stability of her government which on May 17, 1902 she surrendered into the hands of her son, Alfonso XIII.

MARIA CRISTINA DE BOURBON, ma-rē'ä krēs-tē'nä thä bôr-bôn', queen of Spain: b. Naples, April 27, 1806; d. Havre, France, Aug. 22, 1878. She was a daughter of Francis I, king of the Two Sicilies, and was married to Ferdinand VII of Spain in 1829. Upon Ferdinand's death in 1833, Maria Christina by her husband's will became regent until her daughter, Queen Isabella, should become 18. A civil war which was waged until 1840 ensued, its purpose being to place Don Carlos on the throne, and its outcome was for a long period doubtful, but the queen-regent appeared to care only for her chamberlain, Don Fernando Muñoz, with whom she secretly contracted a morganatic marriage. Her policy as regent was entirely subject to the will of the minister of the day which naturally resulted in a reign alternately liberal and despotic. When she affixed her signature to the law concerning the Ayuntamientos the public protested so strongly that she was obliged to resign the regency to the Prime Minister, Espartero, in 1840. In 1843, after the fall of Espartero, she returned to Madrid and in 1844 publicly married Muñoz, who was made Duke of Rianzares. A revolution in 1854 compelled her to flee the country and her return to Spain in 1864 was followed by the revolution which dethroned Queen Isabella in 1868 and she was again exiled and though allowed to return to Madrid after the accession of Alfonso XII, she died in exile.

MARIA LESZCZYNSKA, lĕsh-chĭn'y-skä, queen of France: b. Breslau, June 23, 1703; d. Versailles, June 24, 1768. She was a daughter of Stanislas Leszczynska, king of Poland, and shared the obscurity which followed upon his exile. Her marriage to Louis XV in 1725 was arranged by the regent Duc de Bourbon and the minister Fleury and was regarded as an intrigue to further their interests since it antagonized Spain by sending back the young infanta with whom an alliance had been projected. The queen after a brief period in which she tried to control state matters lived very quietly and was noted for her charities.

MARIA LUISA or **MARIE LOUISE,** empress of the French and grand duchess of Parma: b. Vienna, Dec. 12, 1791; d. there, Dec. 17, 1847. The eldest daughter of Emperor Francis I of Austria, she was 18 when Napoleon, in order to have an heir and ally himself to the old royal families of Europe, divorced Josephine and, after the Battle of Wagram and capture of Vienna, demanded her hand of her father and Prince Metternich. From her first arrival in Paris (April 1810) the very cool reception accorded her by the populace which sympathized with Josephine evoked in the new empress an equal coolness toward France and the French. Napoleon, however, was deeply in love with her. While she greatly admired him and feared him a little, she seems never to have loved him. In March 1811 she gave birth to the king of Rome. During Napoleon's absences on campaign she acted as regent, but showed utter incapacity. At the close of the campaign of France, on Napoleon's instructions she quitted the menaced capital and went with her son to Blois, but refused to continue on across the Loire with his brothers. After the emperor's abdication she went to Orléans, then joined her father at Rambouillet. During the Hundred Days she was kept secluded and separated from her son whom she would not see again until at his death. In 1816 the former empress was given the sovereignty of the duchies of Parma, Piacenza and Guastalla. She lost her throne of Parma in 1831 in consequence of a popular revolt. As a ruler she was kindhearted, but her character was light and vacillating and she was devoid of political sense.

MARIA LOUISA, Order of. See ORDERS (ROYAL) AND DECORATIONS.

MARIA MAGDELENA, by C. F. Hebbel. 'Maria Magdelena,' which Hebbel called a "tragedy of common life," is more important as the forerunner of the peasant tragedies of Ibsen and Hauptmann than for any outstanding virtue of its own. It lacks the grandeur, the large stage and large feeling, which give their special quality to 'Herod and Mariamne'; 'Judith' and 'Gyges and his Ring.' It exaggerates the asides and the soliloquies whose dramatic fitness Hebbel defended; it cannot pass the final test of tragedy, which is inevitability. And yet it is the work of a master-dramatist, and the history of realistic drama is not complete which does not include it. For it is one of the first dramas in which the tragedy is centred, not upon a situation but upon the character of a group; in which the conflict is not between the rights of the classes, but between individuals in a family for their personal rights as against "the cruelest of tyrants, the commonplace man in the home circle." It has been called a "tragedy of the fallen woman," and, as such, its weaknesses are apparent. But it is not that. The name of the play is peculiarly unsuitable. It is the tragedy of narrow vision, the tragedy of that fear of what people will say which actuates the life of Master Anton, of Clara, his daughter, and Carl his son, and of their friends and neighbors. 'Maria Magdelena,' was one of the most popular of Hebbel's creations, and is still played in the repertory theaters.

EDITH J. R. ISAACS.

MARIA PIA, queen of Portugal: b. Turin, 1847; d. Italy, 1911. Her father was Victor Emmanuel II of Italy. At the age of 15 she was married to Luiz I, king of Portugal. She became dowager queen on 9 Oct. 1889, when her son, Carlos I, ascended the Portuguese throne. The latter and his son, Crown Prince Luiz, were assassinated in Lisbon 1 Feb. 1908, and the aged Maria Pia saw her grandson, Manuel II (q.v.), ascend the throne. Maria Pia devoted herself to charitable work and took no part in the public life of the nation. When the republic was proclaimed in 1910 she fled to Italy and sought refuge with her sister, Princess Clotilda.

MARIA THERESA, tē-rē'sa (Ger. tā-rā'zä), German empress, queen of Hungary and Bohemia, Archduchess of Austria: b. Vienna, 13 May 1717; d. there, 29 Nov. 1780. The oldest daughter of the Emperor Charles VI, she was carefully educated, was named heir to the throne by the Pragmatic Sanction, and in 1736 married Stephen, Duke of Lorraine, who became Grand-Duke of Tuscany in the next year, and who in November 1740, a month after Maria's accession to the throne of Hungary, Austria and Bohemia, was named joint regent with her. France and Bavaria invaded Bohemia; and at the same time she was beset by Frederick the Great in Silesia, by Spain and Naples in Italy, and by the counterclaims of Charles Albert, who was proclaimed first Archduke of Austria and then German emperor. She fled from Vienna to Presburg, convoked the Diet, raised a Hungarian army, won the alliance of England, made a secret peace with Prussia, surrendering Silesia and Glatz, and gained peace by the Treaty of Aix-la-Chapelle, October 1748, securing the election of her husband as German emperor in return for the cession to Spain of Parma, Piacenza and Guastalla. To revenge herself on Frederick she formed an alliance with Russia, and, by the help of her chancellor, Kaunitz, with France. With the further help of Sweden and Saxony she was preparing to strike at Prussia, when Frederick forestalled her by striking the first blow and opening the Seven Years' War (q.v.). This terrible struggle availed Austria nothing and Maria Theresa had to admit Prussia's right to Silesia in the Peace of Hubertsburg 15 Feb. 1763. Francis I, her husband, died 18 Aug. 1765, and Maria associated with her as emperor her oldest son, Joseph II, but kept in her own hands everything save military administration. Seven years afterward, upon the first partition of Poland, she received Galicia and Ludomeria; and in 1775 Bukovina was granted to Austria by Turkey Twen the Peace of Teschen, closing the War of the Bavarian Succession, brought Austria the Inn Valley in 1779; but the Princes' League (Fürstenbund), under the lead of Frederick II, struck a heavy blow at Austrian supremacy. Though best known for her part in European politics, Maria Theresa was equally great in interior administration; Austrian finance was revived, agriculture encouraged and higher education fostered. The empress was a strict Catholic and an enemy of the Protestant Reformation, but in this latter part of her reign under the influence of her free-thinking son's policies, she was induced to enact some anti-ecclesiastical legislation, which he subsequently developed into persecutions. She was a pure and noble woman, strikingly beautiful in her youth. Ten of her 16 children survived her. Monuments to Maria Theresa are to be found in Klagenfurt, Vienna and Presburg. Her letters to her children and her friends were edited by Arneth (1881), who wrote 'Maria Theresa' (1888). Consult also de Broglie, 'Marie Thérèse' (1888); de Villermont, 'Marie Thérèse' (1895); Wolf and Zwiedineck-Südenhorst, 'Oesterreich unter Maria Theresa' (1884); Bright, 'Maria Theresa' (1897).

MARIA THERESA, Order of. See ORDERS AND DECORATIONS.

MARIAMNE, mā-rī-ăm'nē, granddaughter of Aristobulus and Hyrcanus, the high-priest, and wife of Herod the Great. Her history is related by Josephus from whom we learn that Herod was devotedly attached to her. She was condemned to death through the machinations of Salome, her husband's sister, on a false charge of adultery, 28 B.C. She met her fate with an intrepidity worthy of her noble ancestry, and was bitterly deplored by the king after her decease. Several plays have been based on the story.

MARIANA, Juan, hoo-ăn' mä-rē-ä'nä, Spanish historian: b. Talavera, 1536; d. Madrid, 17 Feb. 1623. Taking holy orders he entered the Society of Jesus. To his training at the University of Alcala he owes the pure taste and eloquence of his writings. He taught theology for 13 years with distinction in Rome, Sicily and Paris, returning to the Jesuits' College at Toledo in 1574, where he wrote his 'Historia de Rebus Hispaniæ' (1st ed., Toledo, 1592), in elegant Latin, but afterward translated it into Castilian. His tone is impartial, though he

defended, in *De Rege et Regis Institutione* (1599), killing of kings who proved tyrants.

MARIANA, mâr-ĭ-ăn'ȧ, in American colonial history, a name given by John Mason (q.v.) to the tract granted to him between the Salem River and the Merrimac. Here he founded an agricultural settlement and formed the Laconia Company in 1629. Mason returned to England in 1633 and died there two years later. In 1691 his heirs sold all his lands and rights in New Hampshire to Gov. Samuel Allen.

MARIANA ISLANDS (commonly MARIANAS, formerly LADRONE ISLANDS), an island group in the Pacific Ocean, north of the Tropic of Cancer, 1,500 miles east of the Philippine Islands; from north to south, the group extends for 380 miles. The islands were discovered in 1521 by Ferdinand Magellan (q.v.), who sighted Guam and Rota, and were settled by the Spaniards, who named them Islas de los Ladrones ("Thieves Islands") because they were a rendezvous for pirates; after Jesuit missionaries were sent to the islands in 1667 by Mariana of Austria, queen of Spain, they were renamed Marianas for her. Spain ceded Guam (q.v.), southernmost of the group, to the United States in 1898, following the Spanish-American War, and in 1899 sold the remaining islands to Germany for $5,000,000; after World War I the German islands, together with the Marshalls and the Carolines, became a mandate of the League of Nations and were entrusted to Japan for administration.

The Japanese Marianas comprised 14 islands, besides islets and reefs, with an aggregate area of 246 square miles; the population in 1935 numbered 44,025, including 39,728 Japanese. Northward from Guam, the islands are Rota, Tinian, Saipan (on which was Garapan, pop. 6,000, the seat of administration), Farallon de Medinilla, Anatahan, Sarigan, Guguan, Zealandia Bank, Alamagan, Pagan, Agrihan, Asuncion, Maug, and Farallon de Pajaros—all lost to Japan in World War II. The northernmost 10 islands are volcanic and uninhabited. Sugar and cotton are grown on Saipan (15 miles long by 4 in width), Tinian (13 miles by 6), and Rota (12 miles by 4); and other crops, on most of the islands, include coconuts, rice, sugar, corn (maize), tobacco, and coffee. The breadfruit tree was first discovered on the Marianas.

Early in 1944 United States naval and air forces commenced a series of attacks to retake Guam and capture the Japanese Marianas. Troops were landed on Saipan on June 15, and on July 4 they occupied Garapan and Tanapag, a second town; the entire island fell to the Americans on July 9, the total cost being 3,426 killed and 13,099 wounded. The Japanese lost 27,586 killed and 2,161 captured, many of these being subsequently accounted for on hills and in caves to which they had retreated. The invasion of Tinian was launched on July 23, 1944, and the island was completely occupied by the end of the month, the United States suffering 1,829 casualties, of whom 314 represented men killed; 6,939 Japanese were killed, and 523 captured. Several other islands remained in Japanese hands, including Rota and Pagan, until September 1945. The islands, exclusive of Guam, were assigned by the United Nations to the United States in 1947 as a trust territory.

MARIANNA, mâr-ĭ-ăn'ȧ, city, Arkansas, and Lee County seat, altitude 235 feet, on L'Anguille River; on the Missouri Pacific Railroad, 22 miles northwest of Helena. It is in an agricultural region, and cotton processing is the principal industry. Pop. (1950) 4,530.

MARIANNA, city, Florida, and Jackson County seat, altitude 80 to 117 feet, on the Louisville and Nashville and the Marianna and Blountstown railroads. It is the trading center for a region producing corn, cotton, pecans, peanuts and fruit. Pop. (1950) 5,845.

MARIAZELL, mä-rē-ä-tsĕl', town, Austria, in Styria, near the Salza, 60 miles southwest of Vienna. It is a noted pilgrim resort, annually visited by about 200,000 persons, attracted by the 12th century image of the Virgin and Child. It is noted as a winter and summer resort. Pop. (1948) 2,330.

MARICOPA, măr-ĭ-kō'pȧ, or **COCOMARICOPA,** an Arizona tribe of Indians, a branch of the Yumans, formerly inhabiting the region around the confluence of the Gila and Colorado rivers. Their descendants and the Pimas, with whom they subsequently confederated, are to be found in the Gila River Reservation.

MARIE ANTOINETTE, mȧ-rē' ăN-twȧnĕt' (in full JOSÈPHE JEANNE MARIE ANTOINETTE), queen of France: b. Vienna, Austria, Nov. 2, 1755; d. Paris, Oct. 16, 1793. She was the daughter of the Emperor Francis I and Maria Theresa. In 1770 she was married to the Duc de Berri, dauphin of France, and after he ascended the throne in 1774 as Louis XVI she made enemies about the court because of youthful frivolities and extravagances. Spoken of contemptuously as *l'Autrichienne* ("the Austrian woman"), she was considered to be too much under the influence of her mother. Her name was further tarnished by the affair of the diamond necklace (q.v.), in which the Cardinal Louis de Rohan, the imposter Alessandro di Cagliostro, and the Countess de La Motte were the chief actors. Her unpopularity was increased by the enthusiastic reception given her at a banquet on Oct. 1, 1789, where the white bourbon cockades were worn and the national cockade trampled under foot. The attack on Versailles and transfer of the royal family to Paris shortly followed. The queen advised the flight of the royal family from Paris in June 1791, which ended in their capture at Varennes. From that time they were viewed as traitors. On Aug. 10, 1792, the last day of the royalty, the queen exerted all her power to induce the king to resistance. This he thought was vain, and he was led with his consort before the Legislative Assembly. She heard his deposition announced, and then accompanied him to the prison of the Temple. There, deprived of every semblance of royalty, she displayed magnanimity and patient endurance. In August 1793, she was removed to the Conciergerie, and in October was brought before the revolutionary tribunal. She was charged with having dissipated the finances, exhausted the public treasury, corresponded with foreign enemies of France, and favored its domestic foes. She replied with firmness and decision, and heard her sentence pronounced with

perfect calmness. On the same day she was guillotined. Marie Antoinette's faults were due in great measure to her defective education and difficult position. Her expiation of them made her a general object of pitying interest.

MARIE BYRD LAND, mȧ-rē' bûrd' lănd, large section of Antarctica, situated east of Ross Sea and Ross Shelf Ice, and south of Amundsen Sea, at a latitude of approximately 73° to 85° S. and longitude 100° to 150° W. It was named for Richard E. Byrd who claimed the land for the United States in 1929.

MARIE DE FRANCE, mȧ-rē' dĕ frȧns', French poetess of the 12th century, a native of Ile de France, whence her surname, who spent her life in England, where she was well known at the court of Henry II. Her *Lais,* largely based on Breton stories, and full of Celtic spirit and pathos; fables, a revision under the title *Isopet* (that is, *Aesop*) of an English collection; and a tale, *L'Espurgatoire Seint Patriz,* make up the body of her work.

MARIE DE MEDICIS, mȧ-rē' dĕ mā-dē-sēs (Italian MARIA DE' MEDICI), queen of France: b. Florence, April 26, 1573; d. Cologne, July 3, 1642. She was the daughter of Francesco de' Medici, grand duke of Tuscany, and was married by proxy, Oct. 5, 1600, to Henry IV of France, with whom she constantly quarreled, partly because of his inconstancy and his open favor to the Marquise de Verneuil, and partly because of her own haughty, obstinate character, which was not unmixed with ambition. For years she urged him to have her crowned queen; the ceremony took place May 13, 1610, and on the next day the king was assassinated. Marie was accused of complicity in the plot, but the charge is not proven. For seven years she acted as regent and showed a strong friendship for Spain and the Catholic Church, being advised by the nuncio and the Spanish ambassador as well as by such favorites as Concini. She quarreled with her son, later Louis XIII, was reconciled to him by Richelieu, and upon her attempt to displace the latter was forced by that great minister again to leave court in 1630. Her last years were spent in exile in Belgium, England and Cologne. The story of her poverty during these years is untrue.

MARIE GALANTE, mā-rē' gä-länt', island, about 16 miles southeast from Guadeloupe. The area is about 60 square miles. The chief productions are sugar, coffee, tobacco, indigo and cotton. It is a dependency of the French overseas territory of Guadeloupe. Columbus discovered it in 1493, and named it from his vessel, the *Santa Maria.* The French occupied it in 1647, and lost it several times. In 1825 it suffered severely from the hurricane which desolated Guadeloupe (q.v.). Pop. (1946) 29,349.

MARIE LOUISE, empress of France. See MARIA LUISA.

MARIE THERESE or **MARIA THERESA,** queen consort of Louis XIV of France: b. Escorial, Sept. 10, 1638; d. Versailles, France, July 30, 1683. She was the daughter of Philip IV of Spain and of Elizabeth of France. By the Treaty of the Pyrenees in 1659 she renounced any claim to the Spanish throne. In the following year she married Louis XIV, but the union was unhappy. Only one of her six children, Dauphin Louis, survived her.

MARIETTA, mâr-ĭ-ĕt'ȧ, city, Georgia, county seat of Cobb County, on the Nashville, Chattanooga and St. Louis, and Louisville and Nashville railroads, about 16 miles north by west of Atlanta. Kennesaw Mountain is west of the city. It was settled in 1834 and incorporated in 1852. A city charter was granted in 1885. It is in a fertile agricultural region in which stock-raising is one of the prominent occupations. Large marble quarries are in the vicinity. The chief manufactures are chairs, prefabricated houses, castings, hosiery, lumber, marble products, pottery, and frozen foods. There is a United States Air Force base here, and a large aircraft plant built during World War II. The Clarke Library, which contains about 5,500 volumes, is in Marietta. Marietta National Cemetery, located here, contains the graves of 10,279 soldiers.

The mayor and council are chosen at a popular election. Pop. (1940) 8,667; (1950) 20,687.

Marietta was an intermediate objective point in Gen. William Sherman's campaign for Atlanta, and when he crossed the Etowah May 23, 1864, his columns were headed for that place by way of Dallas and New Hope Church, but Gen. J. E. Johnston threw his army in his front and checked him at New Hope Church and Dallas. After many hard-fought battles and constant severe skirmishing, Johnston abandoned his Dallas lines (see DALLAS, GA., BATTLE LINES AT) on June 4, and took position covering Marietta, his left on Lost Mountain, his right beyond the railroad and behind Noonday Creek, with a strong advanced position on Pine Mountain. Sherman repaired the railroad, established a secondary, fortified base at Allatoona Pass, and joined by Blair's Seventeenth corps advanced June 10 and confronted Johnston in his new and strong position, and by the 14th was strongly intrenched before it in a continuous line of 10 miles. Johnston abandoned Pine Mountain on the night of the 14th, and Sherman advanced his lines, bringing on the engagement at Pine Mountain (q.v.) June 15. The general movement was continued on the 16th and the right thrown forward to threaten the railroad below Marietta. On the 18th Johnston fell back to a new line, including Kennesaw Mountain, which was strongly fortified, and Sherman pressed in closely on the center and left, north of Marietta, still continuing the extension of his line to the right, south of it. Johnston, making a corresponding movement by his left, encountered Sherman's right at Kolb's Farm (q.v.) on the 22d. Sherman assaulted Kennesaw Mountain on the 27th, and was repulsed. Flanking operations were then renewed to the right to reach the railroad, and Johnston, finding it in danger and his communications with Atlanta threatened, after being 26 days under an uninterrupted cannonade and infantry fire, abandoned Marietta on the night of July 2 and fell back to a new line, previously selected and intrenched, 10 miles south of Marietta, and covering the railroad and his pontoon-bridges across the Chattahoochee, with an advanced position at Smyrna Campground. Sherman occupied Marietta on the morning of July 3. The Union loss in the operations around Marietta was 1,790 killed and

missing, and 5,740 wounded, an aggregate of 7,530. Johnston reported a Confederate loss of 468 killed and 3,480 wounded.

MARIETTA, city, Ohio, and Washington County seat, altitude 650 feet, on the Ohio River at the mouth of the Muskingum; on the Pennsylvania and the Baltimore and Ohio railroads, 95 miles in direct line southeast of Columbus; and on two federal and two state highways. It has river transportation, with service to many cities; and an airport. It lies in a region of fertile valleys, with coal, iron, oil, and natural gas deposits in the hilly parts. It handles large quantities of fruits and vegetables, shipped to various urban markets. The city's manufactures and industries include castings of iron, brass, aluminum; drilling tools; grindstones; metal signs and markers; paints and varnishes; gas engines and ranges; chemicals; household and office furniture; harness; and a varied list of miscellaneous trade articles.

Marietta has a National Guard armory; a Civil War monument, a monument to the pioneers, and a monument commemorating French participation in the settlement of America; a public library and a state museum, the Campus Martius; and two hospitals. It is the seat of Marietta College, chartered in 1835, but developed from an academy established in 1797.

The Marietta College museum contains some valuable relics of the early history of the western country, especially the records of the Ohio Company.

The city was settled in 1788. The Ohio Company of Associates, under the leadership of Manasseh Cutler (q.v.) and Gen. Rufus Putnam, in Boston, bought lands in the southeastern part of the present State of Ohio, and Putnam led a party of settlers to Western Pennsylvania and thence down the rivers. Upon landing at the mouth of the Muskingum, they called their community by that river's name, but soon changed it to Marietta, in honor of Marie Antoinette. The city developed as the westward country opened up; in its early years it was a thriving river town. The Mound Cemetery, which was set apart for public use in 1788, has the graves of a number of officers of the Revolution; it also contains an ancient Indian mound. An interesting relic of the historic past is the old Northwest Territory land office, a small structure of hand-hewn timbers, in which the first official maps of the region were made and records of transactions in land were kept; it is one of the oldest buildings in the state. At Blennerhassett Island, in the river, Aaron Burr visited his co-conspirator, Harman Blennerhassett, discussing plans for his "empire" in the Southwest.

Marietta has mayor and council, with a service director (city manager). The water supply system is under municipal ownership. Pop. (1940) 14,543; (1950) 16,006.

MARIETTA COLLEGE, in Marietta, Ohio, was founded in 1835 for men and women. It has college and preparatory departments; the latter is known as Marietta Academy. The courses lead to the degrees of A.B., Ph.B. and B.L. Courses are provided for work in music, art and military science, and short summer schools are given for work in the arts and sciences. The library, which has about 100,000 volumes and 30,000 pamphlets, is noted for its books on the history of the Northwest.

MARIETTE, mȧ-ryĕt', **Auguste Edouard,** French Egyptologist: b. Boulogne, France, Feb. 11, 1821; d. Cairo, Jan. 19, 1881. He was educated at the Boulogne Municipal College and in 1839 went to England as professor of French and drawing. He returned to France in 1840, took his degree at Douai in 1841 and became professor at his alma mater, the Boulogne Municipal College. While so engaged he became interested in archaeology and in 1847 published *Lettres à M. Bouillet,* an essay on the history of Boulogne. In 1848 he received a position in the Egyptian museum of the Louvre; and in 1850 was sent by the government to gather Coptic, Syriac, Arabic and Ethiopic manuscripts in Egypt. His excavations and discoveries in connection with his search for the true site of Memphis led to the finding of many important remains, such as the Serapeum, the first Memphian temple discovered near the three great pyramids. Beginning to excavate four miles west of the accepted site of Memphis, Mariette came first upon an avenue of sphinxes, which led directly up to the magnificent granite and alabaster temple of Serapis mentioned by Strabo, which contained the sarcophagi of the sacred bulls of Apis from the 19th dynasty to the Roman supremacy. Besides these he found no less than 2,000 sphinxes, and over 4,000 statues, bas-reliefs and inscriptions, some evidently of Greek construction; and various streets, colonnades, and other structures belonging to a great city. His excavations around the base of the sphinx near Gizeh not only disclosed the entrance to it, but proved it to be sculptured out of the solid rock.

In 1854 he returned to Paris and was made assistant conservator of the Louvre; and in 1855 was sent to Berlin to study Egyptian remains in the museums there. On his return to Egypt, in 1858, the viceroy made him conservator of the monuments and antiquities of the land, with the title of bey, later promoted to pasha, with an annual appropriation for the prosecution of his researches, and the foundation and maintenance of the museum of Boulak. His discoveries at Tanis revealed the monuments of the Hyksos dynasty, and those at Thebes explain the chronology of the various dynasties. In 1860 he made the important discovery of the mummy of Queen Aahhotep, of the 18th dynasty, with a wealth of jewels of exquisite workmanship belonging to her. In 1873 the Institute of France awarded him the biennial prize of 20,000 francs. His discoveries have been of utmost importance for the light that they have thrown upon the earliest periods of Egyptian history.

His chief published works are *Mémoire sur la mère d'Apis* (1856); *Aperçu de l'Histoire d'Egypte* (1864); *Nouvelle table d'Abydos* (1856), account of a second tablet found in Abydos which supplies the vacancies of the first and gives a list of the kings of the first six dynasties, corroborating that of Manethos; *Le Sérapéum de Memphis* (1857–1864); *Fouilles exécutées en Égypte, en Nubia, et au Soudan d'après les ordres du vice-roi d'Égypte* (1867); *Notice des principaux monuments du musée de Boulak* (1870); *Les Papyrus égyptiens du musée de Boulak* (1871); *Album du musée de Boulak* (1873); *Les Mastabas de l'Ancien Empire* (1881–1889), issued posthumously by G. Maspero.

Mariette lies buried in the museum-garden at Boulak, inclosed in an ancient Egyptian sarcophagus. Consult Mariette, Edouard, *Mariette Pacha* (Paris 1904) and Maspero, G. C. C., *Notice biographique sur Auguste Mariette* (Paris 1905).

MARIGNOLLI, mä'rē-nyōl'lē, Giovanni de', Italian traveler: b. Florence, probably about 1290; date of death unknown, but subsequent to 1357. Entering the priesthood, he was appointed one of the four legates sent by Benedict XII to the great khan of Cathay in 1338. The four legates accompanied by about 46 followers traveled east via Constantinople, whence in June 1339 they sailed across the Black Sea to Kaffa. They spent the winter of 1339 at Sarai on the Volga, enjoying the hospitality of Mahommed Uzbeg, khan of the Golden Horde. From his court the party traversed the steppes to Almalig (Kulja), in the modern Ili. They reached Peking via Kamul about June 1342, and were well received by the khan. The arrival of this embassy is chronicled in Chinese annals. Marignolli remained three or four years in Peking, after which he wandered through eastern China to Amoy Harbor. In 1348 he reached Columbum (Quilon) in Malabar, where he founded a Latin church. He stayed 18 months there after which he appears to have visited the coast near Madras, thence journeyed to Java, and on a voyage to Europe was wrecked at Bernwala (Pervily), Ceylon, where he was detained four months by the native ruler, Khoja Jahan. Marignolli returned via Armuz, Baghdad, Mosul, Aleppo, Damascus and Jerusalem, arriving at Avignon in 1353 and delivering a letter from the Khan to Pope Innocent VI. In 1354 the emperor, Charles IV, made Marignolli one of his chaplains, and soon afterward he was consecrated bishop of Bisignano. It does not appear, however, that he ever took possession of his see. About 1355 he removed in the retinue of the emperor to Prague and was papal envoy to Florence in 1356. In 1357 he was at Bologna. The last trace of Marignolli is a letter to him from Richard Fitz Ralph, archbishop of Armagh, Ireland, in which the writer objects to the sending of Marignolli as papal envoy to Ireland. In 1768 (in Prague) Marignolli's work appeared in volume 2 of *Monumenta historiae Bohemiae,* edited by G. Dobner. Modern readers were first attracted by the account published by J. G. Meinert (Munich 1820). Consult Beazley, C. R., *Dawn of Modern Geography,* vol. 3, pp. 142, 180-181, 184-185, 215, 231, 288-309 (1906).

MARIGOLD, a popular name for several unrelated plants. The pot marigold (*Calendula officinalis*) is one of the most widely popular of garden plants. It is grown for its brilliant flowers which range from white to rich orange, and for its flower-heads, which are often used to flavor soups, stews and dressings. The African marigold (*Tagetes erecta*) and the French marigold (*T. patula*) are also widely used for ornament. Their flowers are usually some shade of yellow, but some are brown and some striped. The Cape marigold (*Dimorphortheca spp.*) is also grown for ornament but is less popular than the above. The corn marigold (*Chrysanthemum segetum*) is a weed especially common in European grainfields, but also cultivated for its flowers, for which the plant is sometimes forced in greenhouses. All these belong to the family Asteraceae. The marsh marigold (*Caltha palustris*) is a member of the family (Ranunculaceae. It is a well-known plant in the marshes and wet meadows of North America. The leaves, gathered before flowering, are widely used as a potherb under the name of "cowslip greens." The name fig marigold is applied to various members of the genus *Mesembryanthemum,* several of which are cultivated for their grotesque forms, and their peculiar foliage.

MARIKINA, măr-ĭ-kē'nạ, a Brazilian name for a marmoset (q.v.).

MARIMBA, mà-rĭm'bà, a musical instrument consisting of tuned bars of hardwood graduated in size and suspended over the open ends of tuned resonators. The bars, arranged like the keys of the piano, are sounded by striking with rubber-tipped mallets. The marimba is of ancient origin and is found among many primitive peoples. Its existence in the New World is due originally to the importation of Africans. At the end of the 19th century, Sebastian Hurtado of Guatemala improved the instrument, extending its compass and using as resonators wooden boxes shaped like the gourds formerly used. Near the end of each box is an opening covered with cured pig's gut which in vibrating increases the volume and imparts a string-like tone to the instrument. Such resonators are peculiar to the Central American marimba and give it the compass and versatility of the piano. The manufactured type of marimba has a range of four octaves and uses metal tubes as resonators. In recent years the marimba has grown in popularity, attracting the attention of serious musicians. Though similar to the xylophone (q.v.), which originated in Europe, the marimba has greater range and superior tone quality.

FRANK K. MACCALLUM.

MARINDUQUE, mä'rên-dōō'kâ, Republic of the Philippines, island and province southwest of Tayabas, Luzon. Area, 356 square miles; pop. (1939) 81,768; capital, Boac (20,977).

MARINE CITY, Mich., city in Saint Clair County, situated on the Saint Clair River and the Port Huron and Detroit Railroad, 45 miles north of Detroit. It enjoys a considerable reputation as a summer resort, but it is also a busy manufacturing center with salt works, beet sugar factories, and shipyards. Pop. (1950) 4,270.

MARINE CORPS, United States. Established Nov. 10, 1775, by resolution of the first Continental Congress, the Marine Corps is a component part of the naval establishment. It is headed by its commandant, a four-star general, who, with his operational and administrative staffs, maintains headquarters in Washington, D.C. The commandant is appointed by the president to serve a four-year term. Since the corps was created it has participated in all wars of the United States, and at various times detachments have been in action in China, Nicaragua, Haiti, and Mexico, and many other foreign lands, where they have been sent to protect American lives or American interests. The world-wide service of the Marine Corps of the United States is symbolized in its insignia represented

by the globe, foul anchor, and surmounting eagle holding in its bill a streamer upon which is inscribed the motto of the organization: «Semper Fidelis.»

Despite the fact that the marine corps regards 10 Nov. 1775 as its birthday, the history of the American marines antedates that of the United States as an independent country. As early as 1740 three marine regiments were recruited in America, assembled in New York under the command of General Alexander Spotswood of Virginia, and performed valiant service in the West Indies for the Royal British Navy. Included among the officers of these marines was Lawrence Washington, a brother of General George Washington. During the colonial period, which ended in 1775, thousands of men acting as marines, and known as such, served on American vessels, and took part in many expeditions, including those against Acadia, Louisburg, Quebec, Cartegena, and Porto Bello. During the Revolutionary War the navies of several of the colonies came into existence, and many of their vessels carried marines who played an important part in the operations against the enemy. In May 1775 marines served with Benedict Arnold at Lake Champlain, and a few months later, on board Washington's cruisers in New England waters.

In 1776 a detachment of marines took part in the expedition of Commodore Esek Hopkins against New Providence, in the Bahamas, where occurred the first fight in the history of the regular navy. In this engagement the attacking party of some 300 marines and sailors under Major Samuel Nicholas—first commandant of the marines—captured the enemy forts and a quantity of military stores, including a large amount of powder which was badly needed by the colonial forces. One battalion of marines, sent as reinforcement to Washington after the retreat across New Jersey, fought with him at the Battle of Princeton, and in subsequent land engagements. Other marines, serving on board all the larger vessels of the navy, took part in various sea fights that helped to bring success to American arms. Under John Paul Jones, they participated in the famous battle between the *Ranger* and the *Drake,* and in the great victory of the *Bon Homme Richard* over the British *Serapis,* which has been termed «one of the most remarkable and desperate fights in the annals of our navy.»

Following the close of the war, the marines, like the army and the navy, were disbanded with nothing remaining but a glorious record. However, when the threatening attitude of various foreign countries called for the creation of defense forces, a regular Navy Department was set up and on 11 July 1798 President John Adams approved an act of the Congress providing for the establishment of a marine corps, patterned somewhat after the Royal Marines of Great Britain. The naval war with France (1799–1801) afforded the newly created marines their first opportunity for action, and in the various sea fights they gave a good account of themselves. During the war with the Barbary States, marines serving with the navy not only took part in the bombardment of Tripoli, but served under Commodore Stephen Decatur in all of his daring exploits, including the burning of the *Philadelphia* in the face of enemy fire. In April 1805 a detachment of marines under Lieutenant P. N. O'Bannon, U.S.M.C., marched 600 miles across the North African desert, and took part in the capture of Derne. After lowering the Tripolitan flag, they hoisted in its place the Stars and Stripes—the first time the American flag ever flew over an Old World fort. «To the Shores of Tripoli» has ever since been inscribed on the banners of the corps, and is recorded in the Marines' Hymn. (See BARBARY POWERS; PHILADELPHIA, DESTRUCTION OF THE.)

The marines also took an active part in the War of 1812 on both land and sea. They participated in all of the many sea fights and were aboard the *Constitution* in her memorable fight with and defeat of the *Guerriere,* when their commander, Lieutenant Bush, was killed repelling boarders; they took part in the sanguinary combat between the *Chesapeake* and the *Shannon* when Lieutenant Brown and 11 of his men were killed; under Commodore Decatur, they fought with great steadiness in the battle that resulted in the capture of the frigate *Madedonian* by the *United States;* they shared in the decisive victory on Lake Erie; and won additional honors as part of the military force under General Dearborn which invaded Canada. They also fought in the Battle of Bladensburg under Commodore Barney, and with General Andrew Jackson in the Battle of New Orleans. In succeeding years the marines saw action in many parts of the world. They served against Indians in Georgia and Florida, against pirates in the West Indies, and on punitive expeditions against the South Sea islanders of Quallah Battoo, Sumatra, and the Fijis.

During the War with Mexico, marines served under Commodores Sloat, Shubrick and Stockton; on the Pacific Coast; under Commodores Connor and Perry on the East Coast; and on shore under Generals Scott, Taylor and Worth. They were present at the capture of Monterey, Yerba Buena (San Francisco), and Mazatlan, and were highly commended by Commodore Shubrick for their conduct at Los Angeles, San Diego, San Gabriel and Guaymas. They took part in the capture of Vera Cruz; marched with General Scott on Mexico City; aided in the storming and capture of Chapultepec; then entered the Grand Plaza, in Mexico City, and led the way to the Hall of the Montezumas. Hence the inscription «From the Hall of the Montezumas to the Shores of Tripoli,» which appears on the banners of the corps. Detachments of marines formed part of Commodore Perry's expedition to Japan which opened the doors of the Mikado's realm in 1853–54 to civilization and commerce.

During the Civil War marines took part in all of the more important naval engagements, including those of the Gulf and the lower Mississippi, and the Battle of Mobile Bay, also in many of the battles on land. They fought in the first Battle of Bull Run, participated in the night attack on Fort Sumter in 1863, in the operations leading to the capture of New Orleans, in the fight between the *Alabama* and the *Kearsarge,* and in the attack on Fort Fisher, the last big operation of the war. In 1859 marines constituted a part of the force under Colonel Robert E. Lee, then an officer in the United States Army, that captured John Brown, and suppressed the riot at Harpers Ferry. After the close of the Civil War the marines devoted a large part of their time to aiding the civil

of existing marine units and the creation of new units for service on newly commissioned vessels. Marine detachments form a part of the complement in all American battleships, aircraft carriers, heavy cruisers, and in the later type of light cruisers, as well as in other types of combat ships.

During the Second World War the Marine Corps was recruited to a strength of nearly 500,000 officers and men. It served almost entirely in the Pacific theater of operations, and took part in numerous engagements with the Japanese, notably on Guadalcanal, Iwo Jima and Okinawa. Marine casualties in the Battle of Iwo Jima numbered 19,938, including 4,189 killed. In the Battle of Okinawa the 3d Marine Amphibious Corps joined the 24th Army Corps to comprise the Tenth Army which struck at Okinawa, principal island of the Ryukyus chain, on Easter Sunday, April 1, 1945. Marine casualties in this battle, which ended June 21, 1945, totaled 16,013, including 3,044 killed. On Sept. 3, 1945, Brig. Gen. Lawson Sanderson, commanding the 4th Marine Air Wing, accepted surrender of the Japanese garrison on Wake Island.

The Marine Corps maintains a reserve corps, and during the Second World War recruited a Woman's Reserve Corps, which at its peak in 1945 numbered 19,000.

MARINE ENGINE. See DIESEL ENGINE.

MARINE ENGINEERING. That branch of engineering which pertains to the design and operation of the machinery required for propelling, working and handling of ships. The last two items include such details as steering, loading and unloading cargo, and in general embrace a highly complex organization of electrical and mechanical devices designed for the safety and comfort of the passengers and crew. Marine machinery must possess the highest degree of reliability without being unduly heavy or bulky.

The early history of marine engineering is a story of the development of the steam engine beginning with the rudimentary but somewhat successful pumping engines used for pumping water from mines. These early steam plants were so heavy and inefficient it was doubted if a ship equipped with an engine could ever carry enough fuel to complete a long voyage. The first steamships were simply sailing vessels with engines; the limited bunker space would permit using the engines only part of the time.

The foremost problem of the marine engineer has always been one of reducing the weight and improving the efficiency of the power plant so that the ship, by carrying less machinery and fuel, will be able to carry more cargo.

The machinery aboard a ship is divided into two classes: (1) main engine; (2) auxiliaries, Fig. 1 shows an elementary marine steam plant. It includes only the equipment necessary to drive the propeller. All of this machinery except the boilers and triple expansion engine are *main engine auxiliaries.* The other class of auxiliaries includes such items as electrical generators, steering engines, anchor windlasses, refrigerating machines, etc. Another way of classifying auxiliaries is to refer to them as either *machinery space auxiliaries,* or *deck and hull machinery.*

The cycle of steam and water in the elementary power plant is indicated by the arrows in Fig. 1. The steam from the boilers passes successively through the three cylinders of the engine and is finally exhausted to the condenser. The circulating pump forces sea water through tubes in the condenser while the exhaust steam condenses on the outside surface of these water-cooled tubes. A vacuum is maintained in the condenser by the air ejector. The condensate pump discharges the condensed steam to the hot well which is filled with trays of some filtering medium, as loofa sponges, which removes any oil which might be carried over from the main engine. (If the oil were returned to the boiler it would cause overheating and perhaps failure of the tubes or plates.) The water in the hot well is pumped back to the boilers via the feed heater. The feed heater is required by law to prevent stresses in the boilers due to the entrance of cold water. The heater receives its heating steam from auxiliary exhaust steam that would otherwise be wasted and its use increases the efficiency of the entire plant. Hence, it should be used regardless of the safety requirements.

The main condenser performs two important functions: (1) it conserves the fresh water needed to supply the boilers as *feedwater;* (2) it increases the efficiency and power output of the entire plant. The fact that a condensing engine exhausts into a vacuum instead of the atmosphere increases the power produced from a given quantity of steam supplied. Also the feedwater taken from the hot well, or feedwater tank as it is sometimes called, will be hotter than water taken from the ship's tanks, thus less heat will be required in the feedwater heater and boiler to transform it into steam. The condenser referred to above is a *surface condenser* wherein the cooling water and steam are separated by the walls of the tubes so that the boiler water recovered is literally distilled water. Another type of condenser is used on vessels which operate in fresh water, or in harbors where their fresh water tanks can be refilled readily. This condenser is called a *jet condenser,* or *direct contact condenser.* The cooling water is sprayed directly into the chamber which receives the exhaust steam. A vacuum is produced, but the resulting mixture of condensed steam and cooling water is unfit for boiler feed unless the cooling water itself is free from impurities. Early seagoing steamships used sea water in their boilers with reasonable success according to the standards of the day. The steam plants were inefficient but the low steam pressures and types of boilers used did permit the use of sea water which was a very important consideration in the absence of a dependable surface condenser.

The demands of modern watertube steam generators in regard to boiler water can only be obtained with a tight surface condenser plus a scientific procedure of feedwater treatment to prevent corrosion and formation of scale. The deposit of scale on the heating surfaces can be prevented by chemical treatment of the boiler water, while corrosion can be prevented by maintaining the water slightly alkaline and by removing dissolved oxygen before the water enters the boiler. Oxygen can be kept out of the boiler to a satisfactory degree by using the deaerating type of feedwater heater wherein the water and heating steam are brought into direct contact. The water enters the heater in a fine spray which exposes the highest possible surface contact with the steam jets. Under the influence of the high velocity steam the air becomes disengaged from

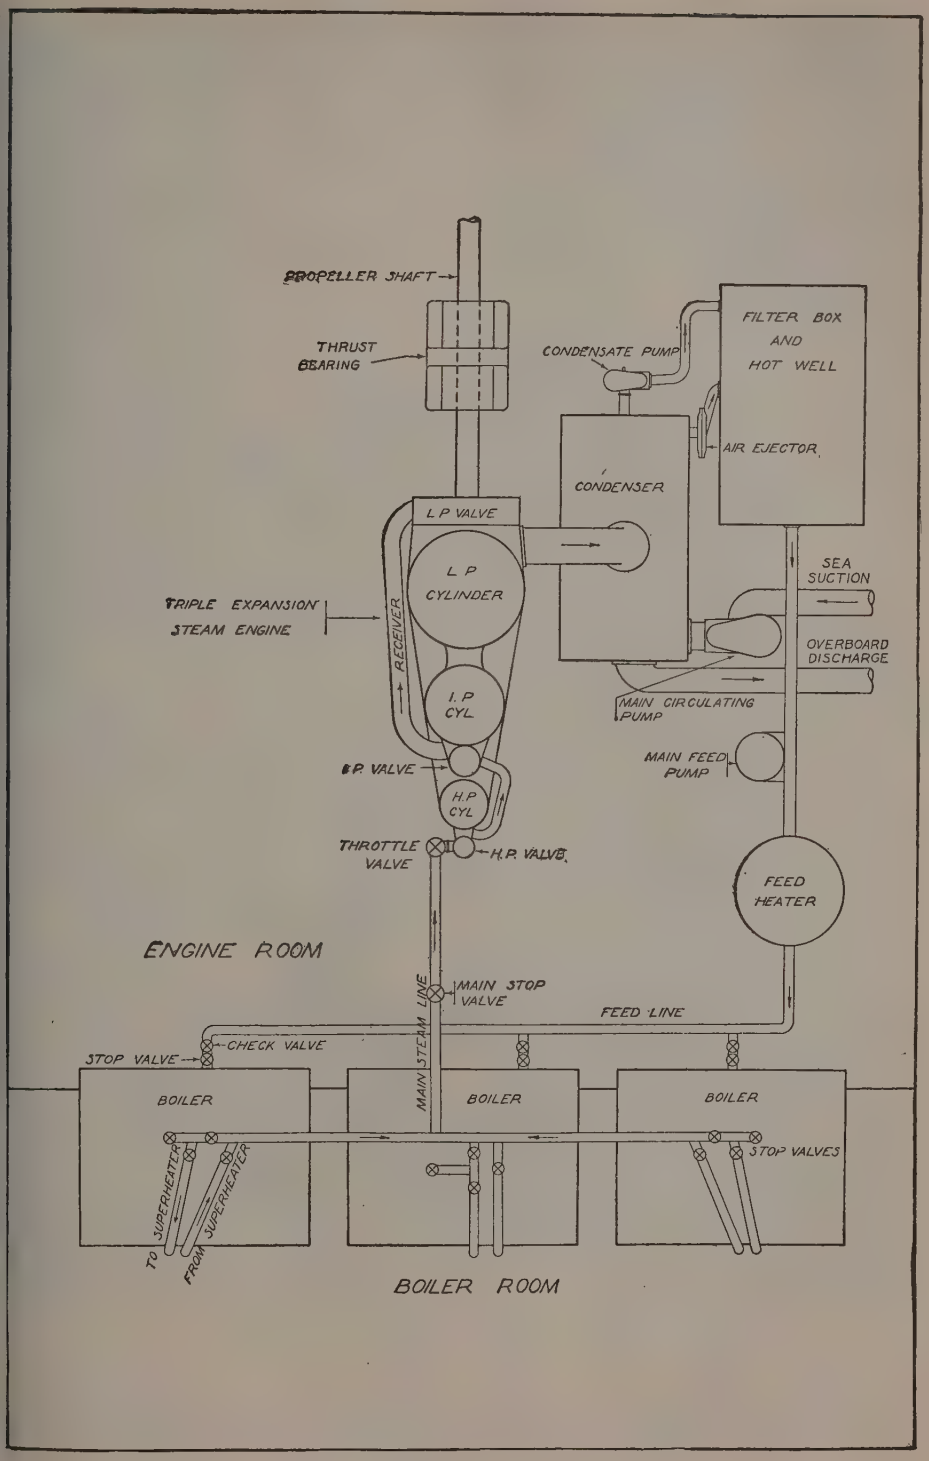

Fig. 1. Elementary Marine Steam Plant.

the water particles and joins the steam flow which carries the air out of the heater. There is no waste of steam as provision is made for condensing it after it has cleared the air from contact with the water. In the elementary steam plant of Fig. 1, the air is removed from the condenser by a steam-jet pump which discharges into the hot well. Since the hot well is open to the atmosphere, this arrangement permits the water to absorb considerable air. An improvement is found in the *closed feedwater system* where the open hot well is replaced by a closed *surge tank,* and where the air ejecter discharges into a separate condenser vented to the atmosphere.

Propulsion.—Early steamships were propelled by *paddle wheels* not only because this method of mechanical rowing was the most obvious but because the paddle wheels were suitable for the slow-turning engines then in use. Paddle wheels proved entirely unfit for seagoing vessels. If the wheels were properly submerged when the ship was fully loaded, they would probably be entirely out of water with the vessel in light condition; also the paddles were quite likely to be damaged by waves in rough weather. Paddle-wheel propulsion is well adapted to vessels of shallow and more or less constant draft, such as river steamers.

The *screw propeller,* generally referred to simply as a *propeller* or a *screw,* is the most efficient and widely used method of propulsion. It began to replace the paddle wheel about 1837. In the first installation the engines were adaptations of the paddle-wheel engines which were fairly satisfactory at rotative speeds on the order of 30 revolutions per minute or less, but were dangerous to the wooden hulls at higher speeds on account of the vibration due to unbalanced forces. For good efficiency the propeller requires a speed of about twice that of a paddle wheel. These higher speeds were frequently obtained by the use of gearing involving wooden-toothed gears on the engine shafts driving smaller iron gears on the propeller shafts. All of these engines were a practical failure due to their great weight as well as their mechanical infirmities. The propeller came into its own with the development of better balanced multicylinder steam engines that could be run fast enough to be connected directly to the propulsion shafting. The only restriction on the use of the propeller is sufficient depth of water and draft of hull to allow it to operate completely submerged. Depending upon the size and type of ship, one to four propellers are used, and the ship is designated as single-screw, twin-screw, triple-screw, or quadruple-screw. See NAVAL ARCHITECTURE—*Model Basins;* SCREW PROPELLER.

Jet propulsion is too inefficient to be considered as a general means of moving a ship through the water. Its principle is simply one of pumping a submerged jet of water opposite to the direction in which the vessel is to be propelled. In order to obtain high efficiency the jet of water must be larger in diameter than is practicable to obtain from any type of pump. Jet propulsion can be used in the special case of a fire boat where the large pumping capacity can be used as effective if not efficient propulsion while running to or from a fire.

Main Engines.—There are two general types of power plants used aboard ship—*steam plants* and *internal combustion engines.*

The extent to which a steam engine will convert steam into mechanical power depends primarily upon its ability to permit expansion of the steam within the engine. In the multistage reciprocating engine the steam is admitted and expanded successively in two, three, or four cylinders depending upon whether it is a *compound, triple expansion,* or *quadruple expansion* engine. The extent to which the steam can be expanded is obviously limited by the size of the low-pressure cylinder. In the *steam turbine* the steam passes through the nozzles and blading at a high velocity which permits a large volume of steam to be accommodated and gives a much higher ratio of expansion than would be practicable in a piston type of engine. However, this inherent efficiency of the steam turbine is not fully gained in turbines of small size. In powers under 3,000 hp. (horsepower) the reciprocating engine becomes competitive with the steam turbine on a basis of economy. The exact line of demarcation depends upon the individual reciprocating engine and turbine being compared. For very high powers the steam turbine has no competitor. It has been built in units as large as 50,000 hp. per shaft.

The principal internal combustion engine used for ship propulsion is the *Diesel engine.* It has been built in all sizes up to 10,000 hp. It has the lowest fuel rate of any prime mover, but in general requires a higher grade of fuel oil than steam boilers.

The question of superiority of one type of propelling machinery over any other involves many factors such as relative fuel costs, importance of weight ratio of fuel to cargo, facilities for maintenance and repair, etc.

Transmission of Power.—There are three ways of transmitting power from the main engine to the propeller: (1) By *direct drive* when the engine is connected directly to the propeller shaft. In this type of drive the rotative speeds of the engine and propeller cannot be selected independently, which may result in a very inefficient combination. The screw propeller requires a relatively low rotative speed for good efficiency whereas the steam turbine requires a high speed. The early direct-drive turbine vessels such as the *Leviathan, Majestic* and old *Mauretania* were inefficient because the shaft speed in each case was a compromise between the most efficient propeller speed and the most efficient turbine speed. The reciprocating and rotary steam engines, and the Diesel engine, can all be used successfully in direct drive.

(2) The *geared drive* was developed mainly to take advantage of the inherent efficiency of the steam turbine. Most of the turbine installations employ double reduction, double-helical gears with speed reductions running as high as 80 to 1. Single-reduction gears are used only on larger high-speed vessels such as the S.S. *West Point* (formerly the S.S. *America*). The single-reduction gear is used for geared Diesel jobs where the required speed reduction is not as high as for steam turbines. The purpose of the geared Diesel drive is to reduce machinery weight and provide greater reliability and ease of maintenance through the use of one or more small high-speed units instead of one large slow engine directly connected. Also, the power which can be transmitted by one shaft is considerably greater in the multiengine drive. In the geared-Diesel it is good practice to introduce a slip-type coupling

between each engine and the gears so as to minimize the torque variations transmitted by the gear teeth. The two types of couplings used are the electromagnetic and the hydraulic.

(3) The *electric drive* is used primarily as a speed reducer. It permits the speed of the electric motor and propeller to be adjusted independently of the engine and generator speed. Electric energy used to drive the propulsion motor can be generated by any type of prime mover. However, steam turbines and internal combustion engines are the only engines used to any great extent in connection with electric drive. In ships of large powers alternating current is preferred to direct current on account of less weight and cost, and greater simplicity. The reduction in speed is obtained by designing a propulsion motor with more poles than the generator. Thus for alternating current the speed ratio between the generator and motor is fixed for any one pole arrangement. Although the Diesel engine has been used to some extent for alternating current electric propulsion the turboelectric plant is the outstanding example of this drive. On the other hand, direct current propulsion finds its greatest usefulness in Diesel-electric jobs.

Aside from the matter of speed reduction the electric drive has other desirable features. In either a-c or d-c jobs it gives full power astern without changing the normal ahead operation of the main engine. In the case of direct current it also gives an exceedingly fine control of power and speed. Also, the electric drive permits pilot house control of the propulsion motors. These last two features are particularly desirable for tugs and icebreakers.

Marine Boilers.—These are of two general types—*firetube* and *watertube*. The Scotch marine boiler, shown in Fig. 8, is the outstanding example of the firetube type. As the name implies, the hot products of combustion pass through the tubes. This type of steam generator is obsolete as far as new construction in the United States is concerned. However, many hundreds are in use in existing vessels. Contrary to this one principal type of firetube boiler, watertube boilers are manufactured in a variety of forms. In the past, each boiler manufacturer built a particular type which was referred to by its proprietary name, such as "Babcock & Wilcox." Since the various boiler companies now build all types, such designations are meaningless to one not already familiar with the boilers concerned. Fig. 9 is a diagrammatic sketch of a water-tube boiler showing the path of water and steam. It should be noted that there are three distinct sections of the boiler: (1) The *preheating section* generally referred to as an "economizer," because originally it was added to older designs in order to increase the economy of the boiler; (2) the *generator section* where the water vapor or steam is formed; (3) the *superheater* section where additional heat is added to the steam. The efficiency of a steam plant increases with increase in pressure and temperature of the steam. Therefore, boilers for modern steam plants must deliver steam at both high temperature and high pressure. Due to consideration of strength of materials the practical limits for a marine steam plant are 1,500 pounds per square inch and 950° F.

The obsolescence of the Scotch boiler is due mainly to its great weight and bulk, and the impracticability of building it for steam pressures higher than 220 pounds per square inch. However, the Scotch boiler does possess some advantages over the watertube such as its ability to use impure feedwater; also, its large volume of contained water makes it less sensitive to changes in rate of firing or feed control. The Scotch boiler is desirable in cases where weight, space and high thermal efficiency are not controlling factors.
